The Negotiation Game: TILI

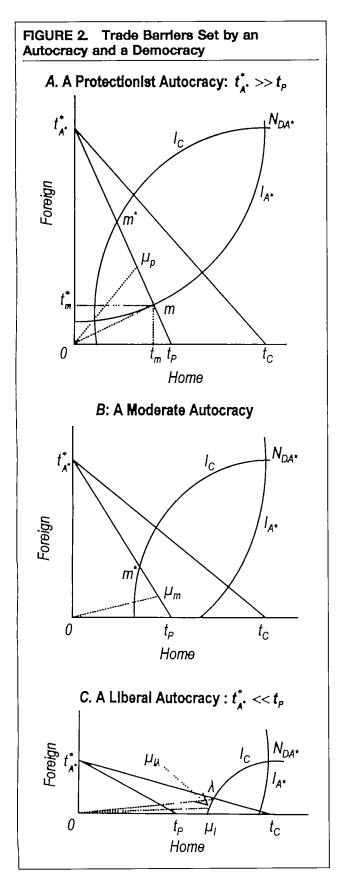

Consider the simplest bargaining game, in which we assume that the actors have perfect information. The players' ideal trade barrier levels at home and abroad are common knowledge, as is the structure of the game. We consider two bargaining structures. In the first game, the home country—by virtue of having the first move—is chosen to make a take-it-or-leave-it (TILI) offer to the foreign country. The latter can either accept and implement this offer or reject it, thereby inducing a reversion to the trade war outcome, that is, the Nash equilibrium. Then we switch the identity of the first mover and consider the same TILI game; that is, the foreign country makes the first move, and bargaining power is reversed. Under either bargaining structure, neither country can dictate the levels of trade barriers that both choose. Both countries know they can gain from making mutual concessions, and they know that everyone must be left at least as well off as they would be in the trade war outcome. We establish that the results are robust to this change in the bargaining structure, and we infer that any structure in which bargaining power is distributed in a less extreme fashion between the players will yield similar results.

For instance, if the parties agree to split evenly the gains from any mutual reductions in trade barrier levels—an approach consistent with the symmetric Nash Bargaining Solution (Nash 1950)—then they will generate outcomes that lie somewhere between that of TILI when the home executive proposes and TILI when the foreign executive proposes. Thus, our results are general to a variety of bargaining structures.

In the TILI game, the moves of the players occur in two steps. First, the home executive, whether democratic or not, makes an offer, specifying a mutually reduced level of home and foreign trade barriers. If both countries are autocracies, then the foreign leader is asked to agree. If home is a democracy and foreign is an autocracy, then the home executive puts her offer to both the foreign autocrat and the domestic legislature. Either player has veto power, which induces a reversion to the trade war outcome. If both countries are democracies, then the home executive picks an offer, which must be acceptable to the foreign executive and both legislatures.9 Failure to obtain legislative ratification in the latter two cases leads to the trade war, or Nash equilibrium, either N_{DA^*} or N_{DD^*} . It is assumed that no player will ever take an action that is dominated: They will not reject an offer that is better than that which will be received in the trade war. The elimination of dominated strategies is equivalent (in this game) to requiring the equilibrium to be subgame perfect.

Note that the structure of preferences in the countries is symmetric. That is, the optimal level of trade barriers preferred by A is the same as that preferred by A^* , and similarly for P and P^* as well as C and C^* . We

⁹ In fact, we require that the international negotiators choose a ratifiable offer that lies on their Pareto frontier when such an agreement exists.

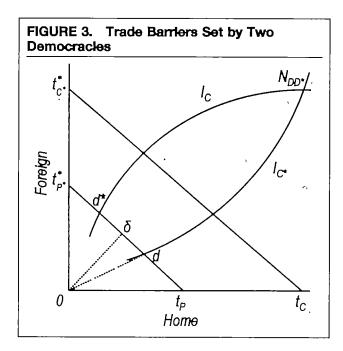

make this assumption because our focus is on differences between regime types, not within each regime type. This assumption, however, has two implications.

First, we do not model what happens when a protectionist autocrat faces an autocrat who prefers to liberalize trade, an interesting issue but one that departs from our focus on variations across regime types.

Second, the symmetry assumption implies that the distance between the democratic executive and its legislature is the same at home and abroad for all democratic dyads. Again, we make this assumption because we are interested in variations between regime types, not within them. Both our model and our data analysis treat each type of regime as homogeneous. Democracies are distinct from autocracies because they have a legislature that exercises ratification power, regardless of its preferences. The differences among regime types rest on institutional features and not on the policy preferences of decision makers. Varying the difference in the ideal policies of P and C does not alter the degree of democracy present; it only changes the extent to which government is divided within democracies. Furthermore, whether a government is divided or unified has no bearing on the degree to which a country is democratic. Hence, examining the influence of such divisions (i.e., as the ideal points of P and C diverge or converge) does not inform us about democracies versus autocracies, only about more divided versus less divided democracies.10 Our model is capable of deriving outcomes when such symmetry of preferences is relaxed, but we have neither the space nor the data in this article to explore these variations within democracies.

Figures 1-3 show the central results. We measure the aggregate level of trade barriers by the sum of the two countries' levels of trade barriers. The indifference curves for the actors C, C^* , A, and A^* through N have been drawn and are labeled I_C , I_{C^*} , I_A , and I_{A^*} , respectively. These curves mark the boundary of the set of mutual reductions in trade barriers that are preferred by each player (respectively, C, C^* , or/and A, A^*) to the noncooperative Nash equilibrium outcome. The solution to the bargaining must lie in this feasible set, often termed the "win set." In addition, the contract curve between the executives A^* (or P^*) and A(or P) has been drawn. It is a straight line between the executives' ideal points (since the indifference curves are circles). The contract curve between C and P (or C^* and P^*) can be thought of as that part of the horizontal (vertical) axis that lies between t_C and t_P $(t_{C^*}^*$ and $t_{P^*}^*$). More generally, the contract curve refers to the set of points where the two actors' indifference curves are tangent, that is, the set of trade barriers that both actors mutually prefer to any other set of barriers. Note, however, that movements along

¹⁰ This is why comparative statics are less helpful. They ask what happens when the executive moves slightly closer to the legislature, or vice versa, and thus examine how divisions in government matter for trade policy. We believe that research on how democracies vary among themselves is vitally important, but we leave for another study an exploration of such intrademocracy divisions. See Lohmann and O'Halloran 1994, Milner and Rosendorff 1996, and O'Halloran 1994 for the effects of changes in the degree of divided government on trade policy.

the contract curve cannot make one actor better off without making the other worse off.

In Figure 1, two autocracies must agree on mutual concessions about trade barriers. Home will offer a mutual reduction of barriers to point a on the contract curve; this is the point on the Pareto frontier that leaves foreign indifferent between accepting and rejecting, thus allowing home to earn all the surplus. The level of bilateral trade barriers under TILI is measured by the sum of the home and foreign trade barriers. These aggregate barriers are $0t_a + 0t_a^*$.

Figure 2 presents the results of bargaining within mixed pairs, while varying the relative preferences of the autocrat and the democratic executive. In Figure 2A, a democracy seeks to find mutually acceptable trade concessions with a protectionist autocrat. The democratic executive, P, has freer trade inclinations than the autocratic leader, A^* . P must offer a set of trade barriers inside the area between the two indifference curves, I_C and I_{A^*} , in order for C and A^* to accept it. In addition, P will offer a point on the contract curve between t_P and $t_{A^*}^*$. Although P optimally wants to choose her ideal point, t_P , she is constrained by A^* . Thus, P must choose the point at which A^* 's indifference curve through the no-agreement point intersects the Pareto frontier, that is, point m.

In Figure 2B, a moderate autocrat seeks mutual trade concessions with a democracy. Now P's ideal point is in the win set. Naturally, P chooses this as the offer $(t_P, 0)$, which both the foreign autocrat and the democratic home legislature accept.

In Figure 2C, a liberal autocrat attempts to find mutual trade concessions with a democracy. The democratic executive is much more protectionist than the autocrat. The outcome in this case also must lie within the win set created by the legislature's indifference curve through the Nash trade war equilibrium, I_C , and the autocrat's indifference curve through this point,

 I_{A^*} . The legislature exercises the major constraint here. The democratic executive and the autocrat will choose a point as close as possible to their ideal points that is still acceptable to the legislature; that is, one lying along the legislature's indifference curve. Hence, their choice is bounded by the legislature's preference in this case. Since P makes the offer, P chooses $\mu_l = t_C - t_{A^*}^*$, which is accepted by A^* as well as by $C.^{11}$

In Figure 3, two democracies with symmetric preferences try to find mutually acceptable trade concessions. The executives must choose a set of trade barriers within the win set formed by the indifference curves of the median legislators through the Nash equilibrium, that is, between I_C and I_{C^*} . Again, the contract curve between the two executives inside the win set is the line segment d^*d . P chooses the point on that line segment closest to her ideal point, t_P . The offer is at point d, which is accepted by the foreign executive and both legislatures.

Levels of Trade Barriers and Regime Type

Can we compare the levels of trade barriers across the three types of regime pairs?

Proposition: Aggregate trade barriers are lower within democratic pairs than within pairs composed of an autocracy and a democracy.

A complete proof for both bargaining structures is given in the Appendix (propositions 1 and 2). Although we measure the aggregate barriers by the sum of the two countries' trade barriers in the proofs, intuitive use can be made of the length of the ray from the origin to the agreement point. Figure 4 shows all the possible outcomes in a single diagram. When home makes the offer, the bilateral trade barrier level in the democratic pair is measured by the length of the ray 0d. In the case of the protectionist autocracy in the mixed pair, the ray has length 0m; in the moderate case, the length is $0t_P$; in the liberal case, the ray has length $0\mu_l$. In all these cases, the ray corresponding to the democratic pair (0d) is smaller than that corresponding to the mixed pair $(0m, 0t_P, \text{ or } 0\mu_l)$.

A democracy lowers its trade barriers more when it seeks mutually acceptable concessions with another democracy than when it deals with an autocracy, no matter what the relative preferences of the two leaders. Why? When both are democracies and home makes the initial proposal, it is the pressure of the foreign legislature that forces the home country to compromise or else end up in a trade war. The Nash equilibrium is worse for both countries in the case of two democracies (N_{DD^*}) than in the autocracy-democracy case (N_{DA^*}) , which induces the democratic executives to agree to liberalize trade more than otherwise. The threat of a legislative veto in both countries moves the executives

¹¹ Recall that P is required to offer to A^* a point on their Pareto frontier; in Figure 2C, no point on the line $t_A^* d_P$ is ratifiable. In this case, P offers μ_b , which is ratifiable.

¹² As Axelrod (1970, 56) observes, a worsening of the no-agreement point can induce greater cooperation between the actors under certain circumstances.

0

to a freer trade equilibrium than in the case of a mixed pair. Paradoxically, then, a protectionist legislature forces democracies to lower their trade barriers more than otherwise.

Home

In contrast, whether such barriers will be higher within democratic pairs than within autocratic pairs depends on the preferences of the leaders in the different regimes. When autocrats are more (less) protectionist than democratic executives, mutual reductions in trade barriers will be smaller (greater) between autocracies than between democracies (proposition 3 in the Appendix). Institutional differences alone do not distinguish between the outcomes; the structure of preferences is also important. The same is true for mixed pairs relative to autocratic pairs. When the preferences of the autocrats are protectionist relative to those of the legislature in a democracy, the pair of autocracies will be unable to lower barriers as much as the mixed pair (proposition 4 in the Appendix). Because the two autocrats do not have to contend with a legislature that is more protectionist than they are, they do not have to compromise as much. This reinforces our counterintuitive claim that a protectionist legislature may actually promote freer trade among

In the Appendix we also show what happens when the foreign country is able to make the first offer. On the whole, the results reported above continue to hold. As the first mover, however, the foreign government has greater bargaining power. In each case, the equilibrium outcome now lies closer to the foreign government's ideal point. In Figure 1, for instance, the outcome is a^* instead of a. When A^* proposes, she knows that A will accept any point on the contract curve at or below the intersection of her indifference curve through the Nash trade war equilibrium, I_A . Thus, A^* proposes the set of trade barriers closest to her ideal point that A will also accept, that is, point a^* . In Figure 2A, the outcome is m^* ; in Figure 2B, it is also m^* . In Figure 2C, the outcome is now λ , since this is

the point at which the highest indifference curve of the foreign autocrat, I_{A^*} , is tangent to the home legislature's indifference curve. ¹³ In the case of two democracies, as in Figure 3, P^* proposes d^* , which both the home executive and the two legislatures accept. In effect, changing the proposer moves the outcome along the contract curve closer to the proposer's ideal point, which improves the outcome for the proposer at the expense of the other country. These outcomes, displayed in Figure 4, show that the ray $0d^*$ (aggregate barriers under joint democracy) is shorter than the rays $0m^*$ (aggregate barriers under the mixed case with a protectionist or a moderate autocrat) and 0λ (aggregate barriers in the mixed case with a liberal autocrat).

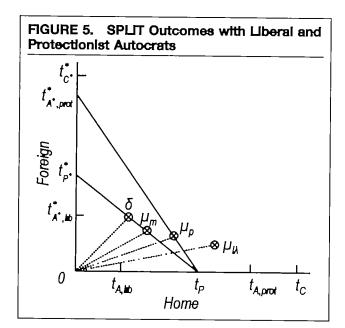

As pointed out above, the equilibrium outcome of any game in which the two countries divide the concessions equally (which we call the SPLIT game) is always in the middle of the range of the contract curve bounded by the maximum value that each can get when she proposes. In the case of two democracies (Figure 3), the SPLIT outcome is in the middle of the portion of the contract curve bounded by d^* and d, labeled 8. The outcomes in the other cases under SPLIT are labeled α , μ_p , μ_m , and μ_h in figures 1, 2A, 2B, and 2C, respectively. Inspection of the lengths of the rays in Figure 5 establishes that $08 < \min\{0\mu_p, 0\mu_m, 0\mu_h\}$.

In sum, regime type is likely to exert an important influence on trade policy. Our model predicts that pairs of democracies should trade more freely than mixed pairs, a result that arises from the tendency for a protectionist legislature to enhance the prospects of trade barrier reductions. Yet, our model is silent on whether commerce will be more open within autocratic pairs than within either democratic or mixed pairs, an issue that hinges on the trade policy preferences of decision makers.

Our model is also silent on the effects of variations within regime types. It does not yield predictions about how institutional differences either among autocracies or among democracies (e.g., whether the government is presidential or parliamentary) affect trade policy, issues that have been addressed elsewhere (e.g., Mansfield and Busch 1995; Milner 1997; Milner and Rosendorff 1996, 1997; Pahre 1997). We focus solely on the institutional differences between autocracies and democracies. Central to our analysis is the assumption that, unlike autocracies, democracies are marked by a legislature that can effectively constrain the chief executive and that is more protectionist than the executive.

Following lemma 2 in the Appendix, it is clear that, given our symmetry assumption in the case of two democracies, aggregate barriers are t_P irrespective of the location of t_C . Hence, it is a direct consequence of lemma 2 that variations in the degree of division between the executive and the legislature in the democracies will have no effect on the outcome when two democracies bargain. Therefore, our claim that democratic dyads prefer lower trade barriers than mixed

¹³ As in note 11, no point on the Pareto frontier between the ideal points of A^* and P is ratifiable in Figure 2C. In this instance, A^* offers λ , which is acceptable to both C and P.

pairs is preserved, even if the legislatures in the democratic dyad case become more protectionist. Put more formally as a corollary to lemma 2 and proved in the Appendix:

COROLLARY. Irrespective of which country makes the first offer, as the legislatures become more protectionist, the aggregate level of barriers on which a pair of democracies agree is unchanged.

EMPIRICAL ANALYSIS

We now turn to an empirical analysis of the hypotheses derived from the model. Our central hypothesis is that trade barriers should be lower between two democracies than between an autocracy and a democracy. It is not possible to test this proposition directly, since reliable data on bilateral trade barriers are not available for many of the countries analyzed here, but data on bilateral trade flows are readily available for most countries and can serve as a proxy for trade policy. Various studies have found that, other things being equal, there is an inverse relationship between the height of trade barriers and the volume of interstate trade (e.g., Harrigan 1993; Leamer 1988; Rodrik 1994, 72; Trefler 1993). We therefore test the propositions stemming from our model by analyzing the effects of regime type on bilateral trade flows and controlling for various other known influences on interstate commerce.

The Statistical Model

To this end, we begin with a gravity model of bilateral trade, which predicts the amount of commerce that should occur between two countries in the absence of trade barriers. It includes the national income and population of both trading partners, as well as the geographic distance between them. Existing research indicates that the gravity framework—which can be derived from a broad class of international trade models—is quite successful in explaining the flow of

interstate commerce (Anderson 1979; Bergstrand 1985, 1989; Deardorff 1998; Eichengreen and Irwin 1995; Feenstra, Markusen, and Rose 1998; Frankel 1993; Frankel, Stein, and Wei 1995; Gowa 1994; Helpman and Krugman 1985; Linnemann 1966; Mansfield and Bronson 1997; Pollins 1989). We extend the gravity model in the following way:

$$\log(X_{q}) = \log \beta_{0} + \beta_{1}\log(GDP_{i} \times GDP_{j})$$

$$+ \beta_{2}\log(POP_{i} \times POP_{j}) + \beta_{3}\log(DIST_{q})$$

$$+ \beta_{4}MIXED_{ij} + \beta_{5}AUT_{ij} + \beta_{6}OTHER_{ij} + \beta_{7}ALLY_{ij}$$

$$+ \beta_{8}PTA_{q} + \beta_{9}MP_{q} + \beta_{10}(ALLY_{ij} \times PTA_{q})$$

$$+ \beta_{11}(ALLY_{ij} \times MP_{q}) + \beta_{12}(PTA_{ij} \times MP_{q})$$

$$+ \beta_{13}GATT_{q} + \beta_{14}COL_{ij} + \beta_{15}COM_{ij} + \beta_{16}WAR_{q}$$

$$+ \beta_{17}\operatorname{lagged} \log(X_{ij}) + \log z_{ij}. \tag{2}$$

In equation 2, X_{ij} is the value of exports from state i to state j in year t. GDP_t and GDP_t are these states' respective gross domestic products in year t-1, POP_t and POP, are their respective populations in t-1, and $DIST_{ij}$ is the geographical distance between them. 14 We take the natural logarithm of each variable because the gravity model's underlying functional form is multiplicative (Anderson 1979; Bergstrand 1985, 1989; Deardorff 1998). Entering the trading partners' national incomes and populations (or, equivalently, their per-capita incomes) in product form is common and accords with theories of international trade based on models of imperfect competition (Eichengreen and Irwin 1995; Frankel 1993; Frankel, Stein, and Wei 1995; Helpman and Krugman 1985).15 These theories indicate that β_1 should be positive and that β_2 and β_3 should be negative.

Ideally, we would use a measure of regime type that directly captures the extent to which countries have a legislature that can constrain the chief executive and affect trade policy choices. Because such a measure does not exist, we rely on a well-known index of regime type developed by Gurr and his colleagues (Jaggers and Gurr 1995; Gurr, Jaggers, and Moore 1989). This measure, which has been used repeatedly in studies of international relations (e.g., Farber and Gowa 1995; Mansfield and Snyder 1995; Oneal and Rusett 1997; Russett 1993), emphasizes five institutional factors that

¹⁴ Per-capita moome is sometimes included in gravity models instead of national population, but doing so yields equivalent results Data on exports are taken from the International Monetary Fund's Direction of Trade (various years); those on GDP and population are taken from the Mark 5 6 version of the Penn World Table (Summers and Heston 1991) and from Maddison 1995. All data on GDP and exports are expressed in U.S. dollars and in real terms; they are deflated using the U.S. wholesale price index and producer price index. Distance is measured based on the closest ports between i and j or, if the countries are landlocked, the shortest land or rail distance between them. These data are taken from the Defense Mapping Agency 1985, Fitzpatrick and Modlin 1986, Times Atlas of the World, and Times Concise Atlas of the World.

¹⁵ The effects of regime type on trade reported below do not depend on whether we introduce the GDPs and populations of the trading partners in product form.

distinguish democracies from autocracies: (1) the competitiveness of the process through which a country's chief executive is selected, (2) the openness of that process, (3) the extent to which there are institutional constraints on a chief executive's decision-making authority, (4) the competitiveness of political participation within a country, and (5) the degree to which binding rules govern political participation within it.

One element of this measure is directly related to our central argument: States are coded as increasingly democratic as the chief executive faces greater institutional constraints, including those emanating from the legislature. But its other components are important as well. If political leaders are not elected competitively, then the legislature will be in a much weaker position vis-à-vis the executive. As Shumpeter (1942) observed, unless leaders can lose office, democratic constraints on their behavior-including those imposed by the legislature—are likely to be ineffective. The competitiveness of elections and political participation, then, are telling indicators of the extent to which institutions such as legislatures can constrain the head of state. Since Gurr's data do not directly tap whether the chief executive needs legislative ratification to enact policies, the following analysis provides only an indirect test of our model. We are unaware, however, of any data that more directly measure legislative control over the head of state. Moreover, this index seems appropriate for distinguishing between regimes with no legislature or an ineffective one and regimes with a popularly elected legislature that can constrain the executive.

To measure regime type, Jaggers and Gurr (1995) create an 11-point measure of a state's democratic characteristics (DEMOC) and an 11-point measure of its autocratic characteristics (AUTOC). They then derive a variable, REG = DEMOC - AUTOC, which takes on values ranging from -10 to 10. Initially, we define countries for which $REG \ge 6$ as coherent democracies, those for which $REG \le -6$ as coherent autocracies, and all remaining regimes as incoherent. After generating an initial set of estimates, we also assess the robustness of our results to this coding procedure. Relying on these criteria, we code each state in the sample as democratic, autocratic, or incoherent in year t-1.

In equation 2, $MIXED_{ij}$ is a dummy variable that equals one if i and j include a democracy and an autocracy, zero otherwise; AUT_{ij} equals one if both i and j are autocracies, zero otherwise; and $OTHER_{ij}$ equals one if either i or j is an incoherent polity, zero otherwise. The reference category is a pair of democratic countries. Since our model indicates that greater trade liberalization should occur between democratic dyads than between mixed pairs, we expect β_4 to be negative. Our model, however, yields no determinate prediction about the sign of either β_5 or β_6 .

Besides addressing the influence of national income, population, distance, and regime type, it is also important to take account of variables that might be respon-

sible for any observed relationship between regime type and bilateral trade. As we explain in more detail below, our analysis centers on the period after World War II. This era was marked by the existence of two major blocs, one made up of autocracies (the Warsaw Pact) and the other composed almost entirely of democracies (the North Atlantic Treaty Organization). To ensure that our results do not simply reflect Cold War rivalries, we include an array of international political variables in equation 2. For instance, there is evidence that democracies were especially likely to ally with one another during the Cold War (Siverson and Emmons 1991). Furthermore, various studies have found that alliances promote trade, which suggests that alliances may account for any observed effects of regime type on trade flows (Gowa 1994; Mansfield and Bronson 1997). In the same vein, recent research indicates that, since World War II, pairs of democracies have been much more likely to establish preferential trading arrangements (PTAs) than other pairs (Mansfield, Milner, and Rosendorff 1998); and it is widely recognized that such arrangements tend to promote the flow of commerce between member states (Frankel 1993; Frankel, Stein, and Wei 1995; Gowa 1994; Linnemann 1966; Mansfield and Bronson 1997; Pollins 1989). To control for the effects of alliances and PTAs, we include $ALLY_{ij}$ and PTA_{ij} . The former equals one if i and j are allied in year t-1, zero otherwise. The latter equals one if i and j belong to the same PTA in t-1, zero otherwise.

Previous studies also have found that states trade more extensively if they are members of the General Agreement on Tariffs and Trade (GATT), if they include a major power, if they have command economies, if they are not involved in a war, and if they had a colonial relationship (Gowa 1994; Kleiman 1976; Mansfield and Bronson 1997; Pollins 1989). As such, we include the following dummy variables, each of which is measured in t-1: MP_{ij} equals one if either i or j is a major power, zero if neither state is a major power; $GATT_{ij}$ equals one if both i and j are parties to the GATT, zero otherwise; COL_{ij} equals one if i and j had a colonial relationship that concluded in or before t-1 (and after World War II's onset), zero otherwise; COM_{ii} equals one if both i and j have command economies, zero if they do not; and WAR_{ij} equals one if i and j are at war, zero if they are not. 17 By including all these variables, we control for the most likely international political influences on trade relations during the Cold War.

Earlier research indicates that states belonging to

¹⁶ To compute these measures, we rely on the coding rules set forth m Gurr, Jaggers, and Moore 1989.

¹⁷ Data on alliances are taken from Small and Singer 1969 and from updates of their list provided by the Correlates of War Project and dated March 25, 1993. Data on PTAs are taken from de Melo and Panagariya 1993, Hartland-Thunberg 1980, Pomfret 1988, and the World Trade Organization 1995. See Singer and Small (1994) for data on major powers and wars, selected usues of the GATT's International Trade and Basic Instruments and Selected Documents for data on GATT membership, Kornai (1992, 6–7) for data on command economies from 1960 to 1985, Staar et al. (1991) for these data in 1990, and Kurian (1992) for data on colonial relations. See Mansfield and Bronson (1997, esp. 105–6) for more on all the data used in this study, except those on regime type.

the same alliance and the same PTA conduct more trade than countries that are either allies or PTA members, but not both. Furthermore, there is evidence that allies and PTA members trade more extensively if at least one state is a major power (Mansfield and Bronson 1997). We thus introduce $ALLY_{ij} \times PTA_{ij}$, $ALLY_{ij} \times MP_{ij}$, and $PTA_{ij} \times MP_{ij}$ in equation 2. To account for any temporal dependence in bilateral trade flows, we include an instrument for the lagged value of log X_{ij} . We also account for any country-specific or year-specific effects on trade by including dummy variables for all but one country and for all but one year analyzed here. Finally, $\log z_{ij}$ is a stochastic error term.

Our sample consists of all pairs of states listed as members of the interstate system by the Correlates of War Project (Singer and Small 1994) in 1960, 1965, 1970, 1975, 1980, 1985, or 1990 for which complete data are available. The independent variables in our model are measured in these years (t-1), and the value of exports from i to j is measured one year hence (in years t, which are 1961, ..., 1991) to minimize any potential problems of simultaneity. We do not analyze years before 1960 because data on GDP and exports are especially limited for many autocracies until that point. Including the available data for these years could bias our results by systematically underrepresenting dyads that are not jointly democratic. After pooling these data, ordinary least squares was used to generate estimates of the parameters in equation 2. Tests of statistical significance are based on White (1980) heteroskedasticity-consistent standard errors.19

Estimates of the Parameters

Our initial results, which are reported in the first column of Table 1, accord with the central proposition advanced earlier. The estimate of $MIXED_{ij}$ is negative and statistically significant, which indicates that trade flows between democratic states tend to be greater than trade flows between democracies and autocracies. Moreover, the predicted difference in trade between democratic pairs and mixed pairs is relatively large: On average, a democracy and an autocracy engage in roughly 15% to 20% less commerce than a dyad composed of two democracies.²⁰

As noted earlier, our model does not yield determinate predictions about whether trade will be more open within autocratic pairs than within either demo-

open within autocratic pairs than within either demo
18 We use an instrument for the lagged value of $\log X_{ij}$, rather than its observed value, because the natural logarithm of the lagged value of exports is likely to be correlated with the error term in equation 2, which would yield inconsistent estimates. This instrument is generated by regressing the lagged value of the natural logarithm of exports on the lagged values of the natural logarithms of GDP_{ij} , GDP_{ij} , POP_{ij} , and POP_{ij} , as well as a dummy variable for each year but one in the sample. Note that we use data on exports from 1956 and data on GDP and population from 1955 to derive estimates of the

lagged value of $\log X_v$ for 1961. ¹⁹ All of the statistical analyses in this article are conducted using STATA version 5.0.

²⁰ More precisely, the estimated change in the predicted volume of trade for a mixed pair compared to a democratic pair is $e^{\beta 4} - 1$. From column 1 of Table 1, $\beta_4 = -0.188$; and $e^{-0.188} - 1 = -0.17$.

cratic or mixed pairs. The results in the first column of Table 1 provide little evidence that the flow of commerce between autocracies differs markedly from the flow between democracies, since the estimate of AUT_{ij} is not statistically significant. Yet, autocratic pairs trade much more extensively than mixed pairs. The estimate of AUT_{ij} is considerably larger than the estimate of $MIXED_{ij}$, and the difference between them is significant (t = 5.79). Finally, the estimate of $OTHER_{ij}$ is negative. Pairs that include an incoherent polity conduct significantly less trade than democratic or autocratic dyads, although they engage in significantly more commerce than mixed pairs.²¹

To assess the robustness of these results, we conduct a number of additional tests. First, our model emphasizes how domestic legislatures constrain the trade policy choices of executives in democracies. But in fledgling democracies, legislative institutions are often weak and poorly developed (e.g., Haggard and Kaufman 1995; Haggard and Webb 1994). Hence, trade policy between mature democracies may differ from that between countries that include a nascent democracy with a weakly institutionalized legislature. To address this issue, we include $DEMZ_{ij}$ in equation 2. It equals one if either i or j experienced a democratic transition between years t - 6 and t - 1 (i.e., if either state is not a coherent democracy in t-6 and if both states are democratic in t-1), zero otherwise. For present purposes, AUT_{ij} , $MIXED_{ij}$, and $OTHER_{ij}$ are set equal to zero if $DEMZ_{ij}$ equals one.

As shown in the second column of Table 1, pairs with a fledgling democracy conduct significantly less trade than pairs composed of two mature democracies, since the estimate of $DEMZ_{ij}$ is negative and statistically significant. Furthermore, when $DEMZ_{ij}$ is included in the analysis, there is even stronger evidence that democratic pairs trade more extensively than mixed pairs. The estimate of $MIXED_{ij}$ continues to be statistically significant, and its absolute value is noticeably larger than before.

Second, we address the robustness of the preceding results with respect to the coding of democratic and autocratic regimes. Thus far, we have coded states as democratic if $REG \ge 6$, and we have coded them as autocratic if $REG \le -6$. These operational definitions have been used in other studies, but they are clearly somewhat arbitrary, and it is important to determine if relaxing them affects our findings. We therefore estimate equation 2 after redefining these thresholds as: (a) 5 and -5, (b) 4 and -4, (c) 3 and -3, (d) 2 and -2, and (e) 1 and -1.

Table 2 shows the estimates of $MIXED_{ij}$, AUT_{ij} , and $OTHER_{ij}$ for each set of thresholds. (The estimates of the remaining parameters are not presented to conserve space.) These results provide a further indication that our earlier findings are quite robust. The estimate of $MIXED_{ij}$ is negative and statistically significant

²¹ Note that, like the difference between democratic pairs and dyads with an incoherent polity shown in Table 1, the differences between $OTHER_{\eta}$, on the one hand, and both $MIXED_{\eta}$ and AUT_{η} , on the other, are statistically significant (t=3.07 and 3.52, respectively).

regardless of which set of thresholds is used, and its size does not vary much. Furthermore, the estimate of AUT_{ij} continues to be positive, and there is only one

case in which it is statistically significant. The estimate of $OTHER_{ij}$ continues to be negative, and it is significant in two instances.

TABLE 2. Estimated Effects of Regime Type on Trade, Based on Different Operational Definitions of Democracy and Autocracy, 1960-90

Operational Definition of			Regression Coefficient	
Democracy	Autocracy	MIXED,,	AUT,,	OTHER,,
REG ≥ 5	REG ≤ -5	171*** (.034)	.109 (.064)	110** (.043)
REG ≥ 4	REG ≤4	184*** (.034)	.100 (.063)	−.119** (.046)
REG ≥ 3	<i>RE</i> G ≤ −3	141*** (.034)	.128* (.063)	060 (.053)
REG ≥ 2	<i>RE</i> G ≤ −2	138*** (.034)	.093 (.063)	047 (.058)
REG ≥ 1	<i>RE</i> G ≤ ~1	143*** (.033)	.053 (.062)	193 (.104)

Note. Entries are unstandardized regression coefficients based on equation 2 and using the Jaggers and Gurr (1995) measure of regime type. Figures in parentheses are White heteroskedasticity-consistent standard errors. One-tailed tests are conducted for the regression coefficient of $MDED_p$, since its sign is specified by the model. Two-tailed tests are conducted for the remaining coefficients. Regressions include dummy variables for country-specific and year-specific fixed effects. * $p \le .05$, ** $p \le .05$, ** $p \le .01$, *** $p \le .001$.

Besides altering the thresholds that distinguish between regime types when the Jaggers and Gurr (1995) measure (REG) is used, we examined whether our results differ if another measure of regime type is used. Various alternative measures exist, but very few cover the range of countries and years analyzed here.22 Alvarez et al. (1996), however, have coded the regime type of most countries in our sample on an annual basis during the period from 1950 to 1990. Unlike Jaggers and Gurr, Alvarez et al. identify each state as either democratic or autocratic in every year. Relying on their measure has certain advantages, since we do not need to establish quantitative thresholds to code regime type. From our standpoint, however, this measure also has certain drawbacks, especially Alvarez et al.'s (1996, 5) intentionally narrow definition of democracy, which centers solely on the competitiveness of the political process. In their view, democracy exists when there are competitive elections for the head of state and the legislature; otherwise, the regime is autocratic. As noted above, the competitiveness of the political process helps shape whether the legislature can effectively constrain the chief executive. In contrast to Jaggers and Gurr, however, Alvarez et al. do not directly measure our key variable of interest: the legislature's role in constraining the executive.

Nonetheless, it is useful to analyze the Alvarez et al. data in order to assess the robustness of our initial results. To this end, we reestimated equation 2 after using their data to code $MIXED_{ij}$, AUT_{ij} , and $DEMZ_{ij}$. Note that $OTHER_{ij}$ is not included in this analysis, since Alvarez et al. code each state as either a democracy or an autocracy. The results are presented in the third column (omitting $DEMZ_{ij}$) and the fourth column (including $DEMZ_{ij}$) of Table 1. Clearly, there is considerable agreement between these findings and those generated using the Jaggers and Gurr data.

Particularly important for present purposes is that the estimate of MIXED, continues to be negative and statistically significant, although its absolute value is somewhat smaller when we rely on the Alvarez et al. data rather than the Jaggers and Gurr data. Furthermore, we again find that democratic transitions dampen trade, since the estimate of $DEMZ_{i}$, is negative and significant. It is also noteworthy that no statistically significant difference exists between the flow of trade within autocratic pairs and democratic pairs. As in the first two columns in Table 1, the estimate of AUT_{II} is not significant, although it is negative when the Alvarez et al. data are used, and it is positive when the Jaggers and Gurr data are employed. In sum, our results are quite robust with respect to the coding of regime type.23

Third, it is useful to ensure that our statistical design does not mask any substantial intertemporal variation in the effects of regime type on trade. In a preliminary effort to address this issue, we conducted separate analyses of each decade in our sample; we pooled the observations for 1960 and 1965, for 1970 and 1975, and for 1980 and 1985, and we analyzed 1990 alone. For each set of observations, we estimated equation 2 using the same operational measure of regime type that was used to generate our original results (i.e., states are coded as democratic if $REG \ge 6$, autocratic if $REG \le -6$). Table 3 presents the estimated coefficients of $MIXED_{ij}$, AUT_{ij} , and $OTHER_{ij}$. (As in Table 2, the remaining coefficient estimates are not reported to

²² For example, the Political Regime Change data set developed by Gasiorowski (1996) is restricted to 97 less developed countries, a much different sample of countries than ours.

²³ Note that we have included country-specific fixed effects in all the preceding analyses, but we also analyzed whether replacing them with pair-specific fixed effects has any bearing on our results. To this end, we reestimated the models shown in the second and fourth columns of Table 1 after accounting for pair-specific fixed effects and found that doing so has little influence on the estimates.

²⁴ To estimate equation 2 for the 1960s, the 1970s, and the 1980s, a dummy variable for the first year in each decade (1960, 1970, and 1980, respectively) is included. Note that the following results are quite similar if the Alvarez et al. (1996) data on regime type are used instead of the Jaggers and Gurr data.

TABLE 3. Estimated Effects of Regime Type on Trade by Decade, 1960–90

	(.126)	(.256)	(.155)		

Note Entries are unstandardized regression coefficients based on equation 2 and using the Jaggers and Guirr (1995) measure of regime type. Figures in parentheees are White heteroekedasticity-consistent standard errors. One-tailed tests are conducted for the regression coefficient of $MIXED_g$, since its sign is specified by the model. Two-tailed tests are conducted for the remaining coefficients. Regressions include dummy variables for country-specific and (in the first three regressions shown above, year-specific) fixed effects " $p \le .05$, **** $p \le .001$.

conserve space.) In three of the four decades we assess, the estimate of $MIXED_{ij}$ is negative and statistically significant, which indicates that the tendency for trade to be more open within democratic pairs than within mixed pairs is relatively stable over time. Also, it is interesting that any tendency for autocratic pairs to trade more extensively than their democratic counterparts has become attenuated over time, an issue that warrants attention in future research.

Our sample includes all countries for which we were able to obtain data for the variables in equation 2. For various countries, however, data on GDP, trade, or both are missing in certain years analyzed here. Since a number of these are autocracies that are unlikely to trade extensively due to their severely distorted economies (e.g., Albania, Cambodia, Cuba, Laos, Libya, North Korea, and Sudan), we ran a series of Heckman selection models to ensure that there was no bias in our earlier findings (Greene 1993, 706-14). We found no evidence of such a bias.²⁵ In addition to the countries in our sample with missing data for certain years, there are other countries for which we were unable to obtain any economic data. These (e.g., Afghanistan, Bangladesh, Burundi, Liberia, Rwanda, Somalia, Uganda, Yemen) were excluded from our sample altogether. Virtually all of them are autocracies with highly distorted economies. Such distortions are likely to hamper commerce, so there is ample reason to expect that our results understate the actual extent to which democratic dyads trade more freely and extensively than mixed dyads. Equally, the omission of these countries probably helps explain why, for example, the estimate of AUT_{ij} is positive in Table 1 when the Jaggers and Gurr measure of regime type is considered.

Finally, we address whether our results are robust

with respect to the inclusion of various factors omitted from equation 2. Of chief importance in this regard are economic growth and the level of economic development. It is possible, for example, that democratic pairs conduct more trade than mixed pairs because democracies experience higher growth than autocracies, and growth promotes trade. Similarly, democracies may be more highly developed economically, and more highly developed states may engage in more trade than less developed countries. Our results do not accord with either of these possibilities; democratic pairs trade more extensively than mixed pairs, but so do autocratic pairs. Nonetheless, as a further test of the robustness of the results, we included in equation 2 the real percapita GDP of both i and j in year t-1. We then replace per-capita GDP with various other factors that have been used as measures of economic development in studies of international trade (e.g., Polachek 1980), including the number of highway vehicles per capita, per-capita school enrollment, per-capita university enrollment, and electrical production per capita. Finally, to examine the effects of growth, we include the change in per-capita GDP of both i and j between year t - 6and year t - 1.26 It should be noted that, for some of these variables, complete data are available for only a fraction of the states and years we analyzed, so the estimates generated after including them in equation 2 are not directly comparable to those in Table 1. But our findings indicate that including these variables has no substantive influence on the estimates in Table 1. Most important for present purposes, the estimate of $MIXED_{ij}$ is negative and statistically significant in each of these analyses.

Turning to the remaining variables in equation 2, the effects of GDP, population, and distance accord with expectations based on the gravity model. As shown in Table 1, the estimate of $\log(GDP_i \times GDP_i)$ is positive and statistically significant, and the estimates of both $\log(POP_i \times POP_i)$ and $\log(DIST_{ij})$ are negative and significant. In addition, the estimates of $ALLY_{ij}$, PTA_{ij} , MP_{ij} , $ALLY_{ij} \times PTA_{ij}$, and $ALLY_{ij} \times MP_{ij}$ are positive; and the estimate of $PTA_{ij} \times MP_{ij}$ is negative. All these estimates are statistically significant when the Jaggers and Gurr data are used, and all but the estimate of $ALLY_{ij} \times MP_{ij}$ is significant based on the Alvarez et al. data. These results indicate that alliances, PTAs, and the presence of a major power each promotes commerce. Moreover, countries that belong to the same alliance and the same PTA conduct more trade than countries that are either allies or parties to the same PTA, but not both. Alliances provide a much greater impetus to trade between states that include a major power than between other states. PTAs yield marginally more commerce between trading partners that include a major power than between other countries.

Our results also indicate that a former colonial relationship heightens bilateral trade flows, that states with command economies trade extensively with each

²⁵ The estimate of ρ (which is the correlation between the error term in the selection equation and the error term in equation 2) is quite small, and we found no evidence that it is significantly different from zero.

²⁶ These data are taken from Banks 1995, Maddison 1995, and Summers and Heston 1991.

other, and that warfare depresses commerce. The estimates of COL_{ij} and COM_{ij} are positive, the estimate of WAR_{ij} is negative, and all these results are statistically significant. GATT membership, however, has a weaker effect on bilateral trade flows. The estimate of $GATT_{ij}$ is positive, which suggests that trade flows between parties to the GATT tend to be somewhat larger than trade flows between nonmember states. But this estimate is relatively small, and it is not statistically significant when the Jaggers and Gurr data on regime type are used.

In sum, the results of this empirical analysis support the central prediction of our formal model. Holding constant a large number of economic and political factors—including variables pertaining to the dynamics of the Cold War—we find that pairs of democracies have conducted considerably more trade than mixed pairs since World War II. Furthermore, although our model generates no definitive predictions about autocratic pairs, it is noteworthy that, based on our sample, no systematic difference exists in trade relations between these pairs and democratic dyads.

CONCLUSION

It is frequently argued that the foreign policies of democracies are distinctive, but few studies have focused on the trade policy choices made by such states. Moreover, most work on trade policy overlooks the effects of regime type. By addressing the effects of regime type on trade policy, this article contributes to the literature on the links between democracy and foreign policy as well as that on the political economy of trade policy.

The model we developed highlights the legislature's role in making trade policy in democracies. Having a legislature that ratifies the chief executive's trade proposals may create a credible threat that allows executives in democracies to arrive at freer trade outcomes than would otherwise occur. The possible veto of a trade deal by one or both legislatures in the dyad may lead the executives to search for lower mutually acceptable levels of trade barriers. This, in turn, may explain why pairs of democracies are better able to lower their trade barriers than mixed pairs.

Our analysis focuses on variations between democracies and autocracies, not on variations within either regime type. Both our model and the data analysis treat each type of regime as homogeneous. Democracies are distinct from autocracies because they have a legislature that exercises ratification power, regardless of its preferences. The differences among regime types rest on institutional features, not on the policy preferences of decision makers. Varying the trade policy preferences of the executive and legislature does not alter the degree of democracy present; it only changes the extent to which government is divided within democracies. Furthermore, whether a government is divided or unified has no bearing on the degree to which a country is democratic. Hence, examining the influence of such divisions (i.e., as the trade policy preferences of the executive and legislature diverge or converge) does not

facilitate comparisons between democracies and autocracies, only between more divided and less divided democracies. Our model is capable of deriving outcomes when such changes occur, but in this article we have neither the space nor the data to explore such variations within democracies. It is interesting to note, however, the finding of others that increasing divisions in the preferences of executives and legislatures may result in more protectionism for a single country and less possibility of trade-barrier-reducing agreements between countries (e.g., Lohmann and O'Halloran 1994; Milner and Rosendorff 1996). Our results differ from but are not inconsistent with those earlier findings. We show that having a protectionist legislature with ratification powers may help democracies arrive at lower levels of trade barriers in their dealings with one

Our theoretical model generates two central predictions. First, aggregate trade barriers will be lower between democracies than between a democracy and an autocracy. Since a trade war between two protectionist legislatures is worse than a trade war involving just one such legislature, two democratic executives will choose significant trade liberalization. Our empirical results accord with this proposition. They indicate that trade between democracies tends to be more extensive than commerce within mixed pairs. On average, dyads composed of a democracy and an autocracy engage in roughly 15% to 20% less commerce than those composed of two democracies. Interestingly, this result seems to strengthen over time. By the 1990s, as Table 3 shows, the average volume of trade between a democracy and an autocracy was roughly 40% less than that of democratic dyads.

Our data overlap the bipolar period extensively. To control for any Cold War influences that might account for the effects of regime type on trade, we analyzed various international political factors. The Cold War was marked by the existence of two camps, with democracies concentrated in one and autocracies in the other. It could be that democratic pairs trade more because they tend to be allies, because they belong to the same commercial institutions (the GATT or PTAs), or because they are not involved in military conflicts. Even when we control for these factors, however, we find that trade flows are significantly greater within democratic dyads than within mixed dyads.

Second, whether the level of aggregate trade barriers will be higher within autocratic pairs than within either democratic or mixed pairs depends on the relative trade preferences of the actors involved. Although it was not possible to incorporate the preferences of political actors directly into our empirical analysis, our results conform with this conclusion. By and large, no significant difference exists between the volume of trade conducted within autocratic pairs and within democratic pairs, which suggests that both domestic institutions and the preferences of decision makers help shape trade policy.

Our model uses a very general institutional characteristic to distinguish democratic and autocratic regimes: the presence or absence of a legislature that can effectively constrain the executive. This simplified approach is appropriate given our purpose, but it may mask variations in trade policy within both democracies (e.g., among presidential and parliamentary systems) and autocracies (e.g., those governed by military leaders as opposed to those governed by hereditary monarchs). Examining the influence of such factors is an important step for future research. It is striking, however, that notwithstanding the institutional distinctions within each regime type, broadly defined differences across regime types exert a noticeable effect on trade relations. Exploring such broad institutional differences across autocracies and democracies, we believe, is an important and prior step toward examining the effect of differences within these two regime types.

Although our analysis hinges on one institutional feature assumed to be common among democracies (i.e., a legislature with the power to ratify executive proposals), it is obvious that many other institutional distinctions can be drawn between autocracies and democracies. These institutional differences may also influence international trade. Our empirical tests pick up the effect of the legislature as well as that of these other differences, so we cannot rule out the possibility that other elements of democracy are important factors. Measures of democracy that isolate the effect of the legislature simply do not exist, however, and given our large, longitudinal sample of countries, they would be prohibitive to construct. Moreover, our evidence and our model reinforce each other, lending credibility to our claims. Abstracting away from preferences and other institutional factors, the presence of popularly elected legislatures that must ratify policies may be an important difference between democracies and other regime types in international trade. Paradoxically, the protectionist threat provided by the legislature in democracies can result in more open trade, rather than less.

APPENDIX

Let the two executives who bargain internationally be identified as i and j.

Lemma 1. The Pareto frontier between i and j is $t^* = -t(t_j^*t_i) + t_j^*$.

Proof: Maximizing $U_i(t, t^*)$ subject to $U_i(t, t^*) \ge U$ and $(t, t^*) \ge 0$ yields the result. Q.E.D.

The TILI Game with Home Offers

In the case of the democratic pair, we require the home executive to offer the foreign executive an agreement that lies on their Pareto frontier (as given by lemma 1).

LEMMA 2. When two democracies negotiate under TILI, the agreement point is $(-1/2\,t_C+1/2\,t_P+1/2\,\sqrt{(t_C^2+2t_Ct_P-t_P^2)},$ $1/2\,t_P+1/2\,t_C-1/2\,\sqrt{(t_C^2+2t_Ct_P-t_P^2)})$, and aggregate barrers are t_P .

Proof: The no-agreement point is $(t_C, t_{C^*}^*)$. Under TILI, with home making the offer, home's problem is max $U_P(t, t^*)$

subject to $U_C(t, t^*) \geq U_C(t_C, t^*_{C^*}), \ U_{C^*}(t, t^*) \geq U_{C^*}(t_C, t^*_{C^*}), \ U_{P^*}(t, t^*) \geq U_{P^*}(t_C, t^*_{C^*}), \ t^* = t^*_{P^*} - t(t^*_{P^*}/t_P) \ \text{and} \ t, \ t^* \geq 0.$ The solution lies at point d in Figure 3, where foreign's indifference curve intersects the Factor fornier. The second constraint binds; we solve $t^* = t^*_{C^*} - \sqrt{t^2_C - t^2}$ and (from lemma 1) $t^* = t^*_{P^*} - t(t^*_{P^*}/t_P)$ for t, t^* . Recalling that we study only the symmetric case $t_P = t^*_{P^*}, t_C = t^*_{C^*}$ and solving, we get the solution above. Q.E.D.

In the case of the mixed pair, the home executive will offer the foreign autocrat a point on the Pareto frontier when such a point is ratifiable. If no such point exists, then P chooses the nearest point to its ideal point that is preferred by both A^* and C to the status quo.

LEMMA 3. When a mixed pair negotiate under TILI, the agreement point is

- 1. $(t_P t_C / \sqrt{t_P^2 + t_{A^*}^{*2}}, t_{A^*}^*, (\sqrt{t_P^2 + t_{A^*}^{*2}} t_C) / \sqrt{t_P^2 + t_{A^*}^{*2}})$, and aggregate barriers are $t_{A^*}^* + t_C (t_P t_{A^*}^*) / \sqrt{t_P^2 + t_{A^*}^{*2}}$ when $t_C^2 t_P^2 < t_{A^*}^{*2}$.
- 2. $(t_p, 0)$ and aggregate barriers are t_p when $t_C^2 t_p^2 \ge t_{A^*}^{*2} \ge (t_C t_p)^2$.
- $(t_C t_P)^2$. 3. $(t_C - t_A^*, 0)$ and aggregate barriers are $t_C - t_A^*$ when $t_A^{**} < (t_C - t_P)^2$.

Proof: The no-agreement point is $(t_C, t_{A^*}^*)$. Under TILI, with home, the democracy, making the offer, home's problem is max $U_P(t, t^*)$ subject to $U_C(t, t^*) \ge U_C(t_C, t_{A^*}^*)$, $U_{A^*}(t, t^*) \ge U_{A^*}(t_C, t_{A^*}^*)$, and $t, t^* \ge 0$.

At point m in Figure 2A, the foreign indifference curve binds, as does the constraint that $t^* \ge 0$. We solve $t^* = t_{A^*}^* - \sqrt{t_C^2 - t^2}$ and (from lemma 1) $t^* = t_{A^*}^* - t(t_{A^*}^*/t_P)$ for t, t^* , and the condition that $t^* \ge 0$ is $t_C^2 - t_P^2 < t_{A^*}^*$. Where $t_C^2 - t_P^2 \ge t_{A^*}^* \ge (t_C - t_P)^2$ neither constraint binds, and the solution is at the point $(t_P, 0)$. When $t_{A^*}^{*2} < (t_C - t_P)^2$, the domestic legislature's constraint binds, leading to the solution at point $(t_C - t_{A^*}^*, 0)$.

We assume that there is a meaningful difference between the ideal points of C and P (and C^* and P^*).

Assumption. $t_C > 2t_P$ and $t_{C^*}^* > 2t_{P^*}^*$.

PROPOSITION 1. Under TILI (when home makes the offers), the mixed dyad has at least as high aggregate barriers as does the democratic dyad.

Proof: Let B^D , B^M , and B^A denote the aggregate barriers for the democratic dyad, the mixed dyad, and the autocratic dyad, respectively. Then $B^D = t_P$, and

$$B^{M} = \begin{cases} \frac{t_{C}(t_{P} - t_{A^{\bullet}}^{*})}{\sqrt{t_{P}^{2} + t_{A^{\bullet}}^{*2}}} + t_{A^{\bullet}}^{*} & \text{if } t_{C}^{2} - t_{P}^{2} < t_{A^{\bullet}}^{*2} \\ t_{P} & \text{if } t_{C}^{2} - t_{P}^{2} \ge t_{A^{\bullet}}^{*2} \ge (t_{C} - t_{P})^{2} \\ t_{C} - t_{A^{\bullet}}^{*} & \text{if } t_{A^{\bullet}}^{*2} < (t_{C} - t_{P})^{2} \end{cases}$$
(A-1)

Suppose $t_C^2 - t_P^2 < t_{A^*}^{*2}$ which implies $B^D - B^M = (t_P - t_{A^*}^*)((\sqrt{t_P^2 + t_{A^*}^{*2}} - t_C)/\sqrt{t_P^2 + t_{A^*}^{*2}})$. Now $t_C^2 - t_P^2 < t_{A^*}^{*2} \Rightarrow \sqrt{t_P^2 + t_{A^*}^{*2}} - t_C > 0$. By the assumption, $t_C > 2t_P > \sqrt{2t_P} \Rightarrow t_C^2 > 2t_P^2$. Then $t_C^2 - t_P^2 > t_P^2$. Now $t_C^2 - t_P^2 < t_{A^*}^{*2}$, so $t_P < t_{A^*}^{*2}$, and $B^D - B^M < 0$. Suppose that $t_C^2 - t_P^2 \ge t_{A^*}^{*2} \ge (t_C - t_P)^2$. Then $t_A^D - t_A^D = 0$. If $t_A^{*2} < (t_C - t_P)^2$, then $t_A^{*3} < t_C - t_P$ or $t_P < t_C - t_A^*$. Hence, $t_A^D - t_A^D = t_A^D =$

TILI When Foreign Makes the Offer

Once again we compare the democratic dyad case with the mixed case. Home is in both cases the democracy. Foreign in

the first case is a democracy and in the second an autocracy. We now let foreign make the offers. Foreign offers the home executive an agreement; if the home executive agrees, then the offer is put to the legislature for a possible veto.

PROPOSITION 2. Under TILI (when foreign makes the offer), the mixed dyad has higher aggregate barriers as does the demo-

Proof: In the democratic dyad the outcome is at point d^* in figures 3 and 5; $B^D = t_P$. In the mixed dyad the outcome is at m^* in Figure 2A and B and at point λ in Figure 2C.

$$B^{M} = \begin{cases} -[-t_{c}t_{F}^{2} - t_{F}t_{A}^{*2}] \\ + t_{A}^{*}(t_{F} - t_{A}^{*}) \sqrt{2t_{C}t_{F} + t_{A}^{*2} - t_{C}^{2}} & \text{if } t_{A}^{*2} > (t_{C} - t_{F})^{2} \\ - t_{F}^{2}t_{A}^{*} + t_{C}t_{A}^{*} - t_{F}]/(t_{F}^{2} + t_{A}^{*2}) \\ t_{C} + t_{A}^{*} \frac{t_{C} - t_{A}^{*2}}{\sqrt{t_{C}^{2} + t_{A}^{*2}}} & \text{if } t_{A}^{*2} \leq (t_{C} - t_{F})^{2} \end{cases}$$

Suppose $t_{A^*}^2 > (t_C - t_P)^2$. Then $B^D - B^M = (t_P - t_{A^*}^*)(t_P^2 - t_C t_P + t_{A^*}^* \sqrt{2t_C t_P + t_{A^*}^{*2} - t_C^2})/(t_P^2 + t_{A^*}^{*2})$. Now $(t_P^2 - t_C t_P + t_{A^*}^* \sqrt{2t_C t_P + t_{A^*}^{*2} - t_C^2})/(t_P^2 + t_{A^*}^{*2}) > 0$, and $t_{A^*}^2 > (t_C - t_P)^2 = t_C(t_C - 2t_P) + t_P^2 > t_P^2$ by the assumption. Then $t_P < t_{A^*}^*$ and $B^D - B^M < 0$. If $t_{A^*}^{*2} \le (t_C - t_P)^2$ then $t_C - t_P \ge t_{A^*}^* > t_{A^*}^* (t_{A^*}^* - t_C)/\sqrt{t_{A^*}^{*2} + t_C^2}$ since $(t_{A^*}^* - t_C)/\sqrt{t_{A^*}^{*2} + t_C^2} < 1$. Then $t_P < t_C - t_{A^*}^* (t_{A^*}^* - t_C)/\sqrt{t_{A^*}^{*2} + t_C^2}$ and $t_C^D > t_C^D > t_C^D$.

Proposition 3. $B^D \le B^A \Leftrightarrow t_p \le t_{A^*}^*$

Proof: This follows from $B^D = t_P$ and $B^A = t_A^*$. Q.E.D.

The Effect of More Divided Democracles

COROLLARY. Irrespective of which country makes the first offer, as the legislatures become more protectionist (or less), the aggregate level of barners to which a pair of democracies agree is unchanged.

Proof: Aggregate barriers are always t_P in the joint democracy case which is unaffected by changes in t_C . Q.E.D.

Comparing Barriers of Joint Autocracies and the Mixed Pair

The outcomes here are not independent of the preferences of the players.

PROPOSITION 4. Under TILI, when home (foreign) makes the offer, $B^A \le B^M$ when $2t_A \le t_C(t_A \le t_C - t_P)$.

Proof: Note that in the autocracy case, $t_A = t_{A^*}^*$. (a) When home makes the offer, $B^A = t_A$, and B^M is as in equation A-1 home makes the offer, $B^A = t_A$, and B^M is as in equation A-1 above. If $2t_A \le t_C$, then $2t_A - t_C \le 0 < t_C - 2t_P$ (by the assumption), which means $t_A < (t_C - t_P)$ and equivalently $t_A^2 < (t_C - t_P)^2$. From equation A-1, $B^M = t_C - t_A$ when $t_A^2 < (t_C - t_P)^2$. Then $B^A - B^M = 2t_A - t_C \le 0$ when $2t_A \le t_C$. If $2t_A > t_C$, then either (1) $t_A^2 < (t_C - t_P)^2$, or (2) $t_C^2 - t_P^2 \ge t_A^2 \ge (t_C - t_P)^2$, or (3) $t_C^2 - t_P^2 < t_A^2$. In the first instance, $B^A - B^M = 2t_A - t_C > 0$; in the second instance, $B^A - B^M = t_A - t_P$. By the assumption that $2t_P < t_C$, we have $t_A^2 \ge (t_C - t_P)^2 > t_P^2$. So $B^A - B^M > 0$. In the third instance, $B^A - B^M = -[t_C(t_P - t_A)/\sqrt{t_P^2 + t_A^2}]$. Again, $t_A^2 \ge t_C^2 - t_P^2 > t_P^2$, so $t_A^2 = t_A^2 = t$ $t_A \sqrt{t_A^2 + t_C t_P - t_C^2}) / (t_A^2 + t_P^2);$ it is straightforward to show that $t_A^2 + t_C t_P - t_A \sqrt{t_A^2 + t_C t_P - t_C^2} > 0$. By the assumption that $2t_P < t_C$, we have $t_A^2 > (t_C - t_P)^2 > t_P^2$. So $B^A - B^M > 0$. If $t_A \le t_C - t_P$, then $B^A - B^M = (t_A - \sqrt{t_A^2 + t_C^2})[(t_C - t_A)/\sqrt{t_A^2 + t_C^2}]$. Now $(t_A - \sqrt{t_A^2 + t_C^2}) < 0$, and $t_A \le t_C - t_P \Rightarrow t_A \le t_C$, and, hence, $B^A - B^M \le 0$.

Mobile Capital, Domestic Institutions, and Electorally Induced Monetary and Fiscal Policy

WILLIAM ROBERTS CLARK New York University MARK HALLERBERG University of Pittsburgh

The literature on global integration and national policy autonomy often ignores a central result from open economy macroeconomics: Capital mobility constrains monetary policy when the exchange rate is fixed and fiscal policy when the exchange rate is flexible. Similarly, examinations of the electoral determinants of monetary and fiscal policy typically ignore international pressures altogether. We develop a formal model to analyze the interaction between fiscal and monetary policymakers under various exchange rate regimes and the degrees of central bank independence. We test the model using data from OECD countries. We find evidence that preelectoral monetary expansions occur only when the exchange rate is flexible and central bank independence is low; preelectoral fiscal expansions occur when the exchange rate is fixed. We then explore the implications of our model for arguments that emphasize the partisan sources of macroeconomic policy and for the conduct of fiscal policy after economic and monetary union in Europe.

wo literatures in political economy investigate the constraints imposed upon those who determine macroeconomic policy. One school argues that domestic institutions influence both the character of the policy process and the outcomes. Rules that require more than a simple majority for a measure to pass, such as the unanimity requirement on many issues within the European Union's Council of Ministers, or an increase in the number of institutional veto players make change in policy difficult (Garrett and Tsebelis 1996; Tsebelis 1995). Particular combinations of labor market institutions and the partisan composition of government have been linked to macroeconomic performance (Alvarez, Garrett, and Lange 1991). Voters are less likely to punish incumbents for poor macroeconomic performance when responsibility for outcomes is blurred by such factors as minority or coalition government (Powell and Whitten 1993). For similar reasons, governments in majoritarian systems find it difficult to maintain fixed exchange rates (Bernhard and Leblang 1999). Central bank independence

William Roberts Clark is Andstant Professor of Politics, New York University, 715 Broadway, New York, NY 10003-6806 (william.clark@nyu.edu). Mark Hallerberg, is Assistant Professor of Political Science, University of Pittsburgh, 4t23 Forbes Quadrangle, Pittsburgh, PA 15260 (hallerb+@pitt.edu).

The paper was first drafted while the authors were members of the Sam Nunn School of International Affairs at the Georgia Institute of Technology, and the authors thank colleagues and students there, as well as at New York University and the University of Pittsburgh, for helpful advice and comments. Revisions were supported by the MacArthur Foundation through the Center of International Studies at Princeton University. We also thank David Andrews, Peter Brecke, Kirk Bowman, Benjamin Cohen, David Denoon, Herbert Doering, Martin Edwards, Jesus Felipe, Jeffry Frieden, Fabio Ghironi, Joanne Gowa, Peter Kenen, Jeffry Lews, Bill Mabe, Jonathon W. Moses, Shanker Satyanath, Beth Simmons, Alberta Sbragia, Rolf Strauch, Michael Wallerstein, Katja Weber, Tom Willett, anonymous reviewers, and the editorial staff at APSR for helpful and insightful comments. The paper also benefited from the comments of seminar participants at the University of California, Berkeley; the Mannheim Centre for European Social Research; the Max Planck Institute in Cologne, Germany, McGill University, Princeton University; Rutgers University; the University of Potsdam; and Washington University, St. Louis. Stephen Flanders provided research assistance. We thank Jakob De Haan for sharing his data.

has been associated with price stability, higher real interest rates, lower variability in those rates, higher growth, greater real output per worker (Alesina and Summers 1993; Cukierman, Kalaitzidakis, Summers, and Webb 1993; Cukierman and Webb 1994; Cukierman, Webb, and Neyapti 1992; De Long and Summers 1992), and a propensity to put external adjustment before internal adjustment (Simmons 1996b). More recently, studies by a number of political scientists suggest that the effect of central bank independence on macroeconomic outcomes depends upon the structure of labor market institutions (Al Marhubi and Willett 1995; Franzese and Hall 1998; Garrett and Way 1995; Hall 1994; Iverson 1998). The common theme in this diverse literature is that institutions, in whatever form, alter the dynamics of the policymaking process and influence the outcomes it produces.

A second school explores whether the international environment limits states' freedom of action (Andrews 1994; Cerny 1994; Kurzer 1993; Moses 1994; Notermans 1993; Pauley 1995; Wallerstein and Przeworski 1995; Webb 1995). Some analysts maintain that increased globalization requires governments to be more sensitive to the demands of fickle markets. Capital will flee states that levy high taxes on business and provide generous social benefits to labor in favor of states with lower tax burdens. States compete for mobile capital by lowering the tax burden and making deep cuts in welfare spending. Over time this competition will lead to the demise of the European social democratic model in favor of the Anglo-American liberal model (Cerny 1994; Sinn 1992; Strange 1996). Others recognize the growing integration of world trade and capital markets but disagree with the globalists about the consequences of these changes. They argue that states retain considerable room for maneuver in more open economies and, indeed, may respond to the risks of international openness by expanding the use of compensatory measures (Garrett 1995, 1998; Rodrik 1997).

These two literatures are not necessarily mutually exclusive. A third body of work examines the interaction between the two schools and considers how institutions refract changes in the international system.

Domestic political institutions can insulate policymakers from systemic changes or, conversely, can leave policymakers more exposed (Garrett and Lange 1995). A large number of domestic veto players also may inhibit states from adjusting policies to changes in their competitors' positions (Hallerberg and Basinger 1998). The general conclusion is that internationalization does not translate frictionlessly into policy change.

Following this last group of authors, we examine how the interaction of the international environment with domestic political institutions constrains a government's ability to engineer preelectoral macroeconomic expansion. It has long been argued that incumbents who want to win the next election may manipulate economic tools at their disposal in an attempt to satisfy the electorate enough to ensure their reelection (Keech 1995, chap. 3; MacRae 1977; Nordhaus 1975; Tufte 1978). Clark and Reichert (1998) find that political business cycles (PBCs) are almost entirely absent in states with independent central banks. They also find that opportunistic cycles are not likely to occur when capital is mobile and the exchange rate is fixed.

One aspect of this finding is curious, however. There are good reasons to expect the identified constraints to make it difficult to use monetary policy for electoral purposes, but there is no a priori reason to expect fiscal policy to be constrained under such circumstances.1 Even when a central bank has complete control over monetary policy, the government can still attempt to affect macroeconomic outcomes through cuts in taxes or increases in expenditures. Similarly, although monetary policy may be constrained when exchange rates are fixed and capital is mobile, incumbents are free to use fiscal policy to create preelectoral expansions. The temptation to use these instruments before elections in order to sway undecided voters may be especially high: in particular, discussions of and attempts to reduce taxes often seem to dominate political campaigns.

Open economy models often privilege monetary policy over fiscal policy, but the literature on the domestic determinants of fiscal policy tends to ignore the international environment in which policy is made (an exception is Oatley [1999]). This may be one reason these studies have produced inconclusive results. For example, Burdekin and Laney (1988) and Franzese (1996) find that central bank independence is related to lower deficits, but several others have not confirmed the relationship (De Haan and Sturm 1994a; Grilli, Masciandaro, and Tabellini 1991; Pollard 1993 [the first and last of these as quoted in Eijffinger and De Haan 1996]). The Mundell-Fleming model indicates that governments can, at best, pursue only two of the following three: capital mobility, fixed exchange rates, and independent monetary policy.² The absence or

presence of each of these conditions affects the nature of the game between a government, which we assume wants to use fiscal and monetary instruments to stimulate the economy shortly before elections, and a central bank, which, so long as it is independent from the government, is immune from electoral pressures. In particular, an independent central bank may be able to prevent opportunistic business cycles when it has control over monetary policy. Such control is possible when capital is immobile, as was generally the case in the industrialized world in the 1960s, or when exchange rates are flexible, as is the case in several countries since the collapse of the Bretton Woods system. When capital is mobile and exchange rates are fixed, however, monetary policy is ineffective, and a central bank, independent or not, cannot deter fiscal expansions. These different expectations based on the Mundell-Fleming conditions may explain why the empirical evidence so far has been mixed.

The article is organized as follows. To sort out the effects of elections, central bank independence, capital mobility, and exchange rate regime on the strategic interaction between fiscal and monetary policymakers, we develop a game theoretic model of the interaction between the government and a potentially independent central bank. We begin the analysis in a closed economy, in which capital is not mobile and exchange rates are fixed, and we find that central bank independence is important in preventing opportunistic monetary cycles but may exacerbate the size of fiscal cycles. We then consider how different Mundell-Fleming conditions affect the game. When exchange rates are fixed and capital is mobile, the international environment restrains governments from pursuing monetary opportunism, but states are expected to engineer preelectoral fiscal expansions. Once again, the independence of the central bank has no causal effect on the occurrence of fiscal cycles. We next examine the predictions of the model with quarterly data from the OECD from 1973 to 1989 for monetary policy and with annual data from the OECD and European Union sources from 1981 to 1992 for fiscal policy. The results largely confirm the theoretical model: There is evidence of preelectoral monetary expansions only when the exchange rate is flexible and central bank independence is low; preelectoral fiscal expansions occur when the exchange rate is fixed. We then consider whether there is evidence for partisan political business cycles that is consistent with our model. Based on the Mundell-Fleming model. Oatley (1999) contends that clear partisan differences existed before the 1990s for fiscal and monetary policy depending upon the underlying economic conditions. Differences between the Left and the Right were present for fiscal policy in the absence of full capital mobility and flexible exchange rates and were present

¹ The authors thank Lawrence Broz, Benjamin Cohen, Peter Hall, and Louis Pauly for their thoughts on this point.

² Discussion of the Mundell-Fleming framework can be found in any open economy macroeconomics text. The foundational works are Fleming 1962 and Mundell 1963. Frieden 1991 and Cohen 1993 are two important extensions of the framework into political economy. The standard Mundell-Fleming model has been criticized for lacking

adequate microfoundations (Dornbusch 1976). Attempts to correct that problem (Corsetti and Pesenti 1997; Dornbusch 1976; Obstfeld and Rogoff 1996) have produced positive conclusions broadly consistent with the standard model At any rate, it is clear that the standard model has guided policy for the last thirty years. See Ghironi and Guavazzi 1998 for a model of interdependence that emphasizes the size of the economy.

for monetary policy in the absence of capital mobility and fixed exchange rates. Unlike Oatley, we find no evidence either for monetary or for fiscal policy. Finally, we argue that political business cycles are likely to become more frequent and worrisome under the fixed exchange rate regime established by the European Economic and Monetary Union.

THE MODEL

Assumptions

Domestic Institutions. "Government" broadly construed can use some combination of monetary and fiscal policy to affect the economy. Monetary policy instruments (the discount rate, purchase and sale of government securities and foreign currencies) can be aimed at policy targets (such as interest rates, the money supply, and exchange rates) in an attempt to produce desired macroeconomic outcomes (growth, price and exchange rate stability, and/or stable balance of payments). The central bank (CB), not elected politicians, ultimately sets the policy instruments. This is not to say that elected officials are irrelevant to the conduct of monetary policy. The extent of their influence varies from country to country and across time. In Germany and the United States, for example, central banks have considerable latitude both in selecting instruments and in choosing targets and goals, whereas in Britain and Norway the central banks traditionally have had much less freedom of action. Although statute and tradition may support a high degree of autonomy, even the Federal Reserve and the Bundesbank are only relatively autonomous. Central bankers are appointed by elected officials, and any latitude they enjoy is granted (and potentially taken away) by elected officials.3

Fiscal policy manipulates taxation and expenditure in an attempt to produce desired macroeconomic outcomes.4 The taxing and spending powers of the central government are controlled by elected officials, but they rely upon the finance ministry for crucial information, analysis, and day-to-day implementation. We adopt the simplifying assumption that the minister of finance is the dutiful agent of the government. The central banker and the minister of finance not only have separate responsibilities and information but also differ in how they evaluate alternative macroeconomic outcomes. We adopt the standard political business cycle assumption that elected officials derive sufficient benefits from electorally timed increases in growth and employment that they heavily discount the negative effect of such behavior on inflation rates. In contrast, as much of the literature argues, decision makers in central banks tend to be more inflation averse than

their principals and, therefore, are likely to discount the value of electorally induced expansions.⁵

We represent actor preferences over macroeconomic outcomes with the following quadratic loss function, which describes how actors assess deviations from their ideal values for unemployment and inflation:

$$L_i = (y - y^{*i})^2 + \alpha^i (\pi - \pi^{*i})^2,$$
 (1)

where π and y are inflation and output, π^* and y^* are the actor's ideal points, α is the weight the actor attaches to inflation stabilization relative to achieving his or her output goals, and i indexes the actor. Deviations from ideal points are squared to capture the intuition that small deviations result in a proportionately smaller utility loss than large ones.

Differences between and among actors in their macroeconomic preferences can be captured by varying assumptions about particular parameters in the model. We emphasize differences between the government and the central bank concerning their ideal rate of growth, but we assume that actors share an ideal point of zero inflation. In addition, both central bankers and governments would like to stabilize the economy at the natural rate of growth, that is, the rate consistent with price stability. The opportunistic political business cycle argument, however, suggests that incumbents are tempted to try to push output above the natural rate just before elections in order to increase electoral support before inflationary consequences are felt. Thus, elections induce a change in preferences, such that

$$y^{*gov} = k^{gov}y^n, (2)$$

where y^n is the natural rate of growth, and k is a coefficient that equals 1 during nonelectoral periods and is greater than 1 in electoral periods. In the absence of central bank independence, these inflationary pressures are transmitted to the central bank through rewards and punishments the government has at its disposal. The central bank then acts "as if" it were minimizing the government's electorally induced loss function. In the absence of independence, the central bank's growth target is as defined in equation 2. If the bank is independent, we assume that it is insulated

³ This creates the opportunity for conflict between government and even the most independent central bank. Berger and Thum (n.d.) analyze this friction, and Berger and Schneider (n.d.) provide evidence that such conflict occurs in Germany

⁴ Fiscal policy has direct distributional consequences, but we will focus on macroeconomic effects in the main body of the article, then return to distributional consequences in the conclusion.

⁵ The same may be true for ministers of finance, who tend to be more concerned about the general health of the economy than are other ministers (Hallerberg and von Hagen 1998).

⁶ Two ways to capture cross-actor differences are found in the literature. Actors may differ in ideal points for inflation and/or output $(\pi^{*i} \neq \pi^{*-i})$ and $y^{*i} \neq y^{*-i}$ (Svensson 1995), or they may differ in the importance they place on inflation stabilization relative to achieving output targets $(\alpha' \neq \alpha^{-i})$ (Lohmann 1992; Rogoff 1985). We adopt the former approach.

⁷ If one is uncomfortable with deriving explanatory power through arbitrary assumptions about changing preferences (and good reasons are provided in Stigler and Becker 1977), then assume that the government is engaged in strategic behavior—it is acting "as if" it were minimizing a loss function, where k > 1 in preelectoral periods in order to maximize its utility in the game it is playing with voters.

⁸ This is the flip side of the logic employed by Blinder (1998), who recommends that politicians instruct the central bank to act as if their ideal point were the natural rate of growth.

from government pressure. Consequently, the bank's growth target will be the same in electoral periods as in nonelectoral periods, such that

$$y^{*cb} = k^{cb}y^n, k = 1.$$
 (3)

The government and central bank both effect changes in macroeconomic outcomes through the manipulation of a short-term, expectations-enhanced Phillips curve:

$$y = y^n + \mu(\pi - \pi^e) + \phi g, \tag{4}$$

where π^{σ} is the rate of inflation expected to prevail at time t, embodied in sticky wage contracts signed at time t-1; g is net government spending; and μ and ϕ are coefficients that characterize the effectiveness of fiscal and monetary policy transmission. The central bank is assumed to control inflation directly, ¹⁰ whereas the government controls spending.

The International Environment. Based on the standard Mundell-Fleming model, the effectiveness with which a government or central bank can manipulate these instruments depends upon the level of capital mobility as well as the exchange rate regime. The Mundell-Fleming model indicates that both instruments are somewhat effective when there is no capital mobility. When capital becomes mobile, however, fiscal policy is effective only when exchange rates are fixed, and monetary policy is effective only when exchange rates are flexible.¹¹

Our model captures the salient aspects of the international environment in the following ways. When capital is immobile, fiscal and monetary policy are only partially effective ($0 < \mu < 1$, $0 < \phi < 1$). When capital is fully mobile and exchange rates are fixed, monetary policy is assumed to be ineffective, and fiscal policy is assumed to be hypereffective (standardized here so that $\mu = 0$ and $\phi = 1$). When capital is fully mobile and exchange rates are not fixed, fiscal policy is ineffective, and monetary policy is hypereffective ($\mu = 1$ and $\phi = 0$).¹²

Order of Play. At the start of the game, the players learn about the structure of the game, that is, they learn whether it occurs in an electoral period, the central bank is independent, capital is mobile, and the exchange rate is fixed. The government then chooses the level of net spending by passing a budget. The central bank observes the budget and then chooses the rate of inflation by deciding whether to raise or lower interest rates or to expand or contract the money supply.

Equilibria

We will solve the game for electoral and nonelectoral periods under alternative assumptions about the independence of the central bank. We first address the closed economy case, then consider the conditional effects of capital flows.

Proposition 1. In general, the government adopts a budget (g), such that net spending is an increasing function of the propensity to push growth above the natural rate and a decreasing function of unanticipated inflation:

$$g = \frac{1}{\Phi} [y^{n}(k-1) - \mu(\pi - \pi^{o})].$$
 (5)

The central bank responds by setting inflation (π) , such that it increases with inflationary expectations and the propensity to push output above the natural rate and decreases with the net budget deficit:

$$\mu = \frac{1}{\mu + \frac{\alpha}{\mu}} [\mu \pi^{e} + y^{n}(k-1) - \phi g].$$
 (6)

Derivation: See Appendix A.

Proposition 1 can be used to derive predictions about central bank and government behavior under different sets of (ideal typical) structural conditions. Specifically, we consider the effect of elections on government and bank behavior and examine whether this effect is modified in important ways by central bank independence and the satisfaction of Mundell-Fleming conditions for national policy autonomy. To establish a baseline, we first discuss the strategic interaction between the government and the central bank in a hypothetical closed economy. We will then consider the effects of different exchange rate regimes in the context of fully mobile capital.

Strategic Interaction under Imperfectly Mobile Capital. In a closed economy, both fiscal and monetary policy are assumed to have some effect on output $(0 < \mu < 1, 0 < \phi < 1)$. In the absence of central bank independence, both fiscal and monetary actors feel pressure to push output above the natural rate (k > 1) during electoral periods. Under these circumstances, both actors' reaction functions are as described in proposition 1. The government anticipates the central bank's response and incorporates it into the budget, setting net government spending so that it is a function of the

⁹ For simplicity, we assume that central banks are either dependent or not.

¹⁰ This is merely a cursory way of saying they manipulate the money supply and/or short-term interest rates in an attempt to effect changes in inflation.

¹¹ See Branson and Butter 1983, Dornbusch 1976, and Mundell 1963. The reasoning is that fiscal expansion (or any other increase in autonomous expenditure) leads to an increase in both moome and interest rates. When capital is mobile, the rise in interest rates attracts capital, which leads to a currency appreciation. When the exchange rate is fixed, the central bank has to expand the money supply to offset the effects of the capital inflow on the exchange rate. Thus, under fixed exchange rates and mobile capital, a fiscal expansion induces a reinforcing monetary expansion. Dooley (1996) suggests in his literature review of capital controls that they be removed in some cases to make fiscal policy more effective in stabilization

¹² These stark conclusions are drawn from a version of the Mundell-Fleming model in which prices are held constant, capital is fully mobile, and the short-term effects of policy are ignored. More measured and realistic conclusions are produced by relaxing these strong assumptions. Nevertheless, the strong conclusions are adopted as a starting point.

TABL	E 1. Comp	parative S	tatic implications of the Model		
	International Conditions B	Central Bank Indepen- dence C	Policy in Electoral Period D	Policy in Nonelectoral Period E	Electorally Induced Policy Change F

propensity to push the economy above the natural rate of growth and inflationary expectations (g = (1/ ϕ)[$y^{n}(k-1) + \mu \pi^{e}$]). The central bank observes the level of spending chosen by the government and responds by setting inflation equal to zero ($\pi = 0$). Since k = 1 for both actors during nonelectoral periods, the closed economy nonelectoral equilibrium is a function of expected inflation $(g = (1/\phi)\mu\pi^{e})$ while inflation is zero ($\pi = 0$). The effect of elections on monetary and fiscal policy is simply the difference between the equilibrium policies in the electoral and nonelectoral periods, as shown in column F of Table 1. Hypothesis 1 summarizes the model's primary predictions regarding the effect of elections on fiscal and monetary policy during electoral periods when capital is immobile and the central bank is dependent.

HYPOTHESIS 1. When capital is immobile and the central bank is dependent, the government initiates a fiscal expansion during electoral periods, and the central bank maintains its nonelection period policies. Fiscal, but not monetary, expansions are expected during electoral periods.

When the central bank is independent, equation 6 is reduced to $\pi = (1/(\mu + \alpha/\mu))[\mu \pi^{\sigma} - \phi g]$ during electoral periods. The government anticipates this and adopts a budget that increases with both inflationary expectations and the propensity to push growth above the natural rate $(g = (1/\phi)\mu[((\mu + \alpha)/\alpha)y^n(k-1) + \pi^{\sigma}])$. The central bank responds in an offsetting manner by choosing a rate of inflation that is a decreasing function of the government's propensity to push growth above the natural rate $\pi_t = (-1/((\mu + \alpha)/\mu))[\mu((\mu + \alpha)/\alpha)y^n(k-1)]$. Once again, the absence of elections implies that k = 1, so in the nonelectoral

equilibrium with an independent central bank, the government sets the net budget deficit in response to inflationary expectations $(g = (1/\phi)\mu\pi^{\sigma})$, and the central bank sets inflation equal to zero $(\pi_{\ell} = 0)$, which is the same as the nonelectoral period with a dependent central bank. As before, the effect of elections on monetary and fiscal policies in the presence of central bank independence can be seen in column F of Table 1 and is summarized in the following hypothesis.

HYPOTHESIS 2. When capital is immobile and the central bank is independent, the government initiates a fiscal expansion during electoral periods, and the central bank responds with a monetary contraction. Fiscal expansions and monetary contractions are expected in electoral periods.

A number of further implications can be drawn from the closed economy equilibrium. First, when the central bank is under the influence of the government, it sets inflation equal to zero in both electoral and nonelectoral periods and allows the government to pursue its electoral goals unimpeded. This particular solution to the "assignment" problem is fairly arbitrary and is the result of the way our model is constructed. It is possible to construct a model in which the government "gets out of the way" and lets a subservient central bank achieve the government's electoral goals through interventionist monetary policy or a model in which the government and bank coordinate their actions around whatever policy mix is optimal, given the relative effectiveness of fiscal and monetary instruments. What is significant, however, is that when the bank is subservient, the government's goals are pursued as if one actor were making policy with two goals and two instruments.

The policy dynamic is starkly different when the central bank is independent. The bank initiates a monetary contraction during electoral periods in order to offset the government's electorally induced fiscal expansion. The size of the expansion increases in accord with the effectiveness of monetary policy and decreases with the weight policymakers assign to price stabilization compared to growth targets. To understand why, it is useful to think of the effectiveness of monetary policy (µ) as the "price" (in terms of inflation) policymakers pay for an additional increment of output (refer to equation 5). Consequently, an independent central bank is more willing to use contractionary measures to discipline the government when monetary policy is effective than when it is not. Since the government anticipates a more aggressive stance by the central bank when monetary policy is effective, it counters with a more expansionary policy than it would otherwise adopt.13 When monetary policy is relatively ineffective, the government cannot count on a large offsetting monetary contraction, so it restrains its expansionary impulse. Since fiscal expansions decrease in accord with the weight policymakers place on price stabilization (α) , the net effect of central bank independence on an electorally induced fiscal expansion depends on the relationship between these two parameters. Specifically, if $(\mu^2/(\alpha + \mu))$ is greater than 1, then preelectoral fiscal expansions are larger when the central bank is independent than when it is not.

Equilibrium behavior under imperfectly mobile capital also suggests that net spending decreases as a result of increases in fiscal policy effectiveness (ϕ). As fiscal policy becomes less effective, the levers of policy have to be moved farther in order to hit any given set of targets. This result has profound implications for empirical attempts to gauge the effect of increased capital mobility on the use of fiscal instruments. Garrett (1995), for example, argues that global financial integration has not reduced the effectiveness of fiscal interventions aimed at shielding domestic populations from the vagaries of the international economy (Katzenstein 1985). In fact, Garrett believes there is evidence of increased activism, presumably as the result of governments responding to the increased risks posed by globalization (see also Rodrik 1997). Our model suggests that the apparent evidence of increased fiscal activism may be as much a sign of growing policy ineffectiveness as of continued support for the "compensatory hypothesis."

The results of the model under imperfectly mobile capital are sufficiently provocative to warrant future research, but our concern here is with how the international environment, and more specifically capital

mobility, constrains policymakers. We now turn to the sharper conclusions of the model under the assumption that capital is fully mobile.

Fixed Exchange Rates and Fully Mobile Capital. According to the Mundell-Fleming approach to the balance of payments, national monetary policy is ineffective when exchange rates are fixed and capital is fully mobile, but fiscal policy increases in effectiveness under these conditions. We have standardized the parameters of monetary and fiscal policy effectiveness so that, when these conditions are met, $\mu=0$ and $\phi=1$. To deduce the behavior of the government and the central bank, we need only substitute these values into the reaction functions given in proposition 1 and solve for Stackelberg equilibria, 15 as in the previous case of imperfectly mobile capital.

When exchange rates are fixed, capital is fully mobile, and the central bank is dependent, the government's reaction function reduces to its propensity to push growth above the natural rate $(g = y^n(k-1))$, and the central bank sets inflation equal to zero. During nonelectoral periods the government's reaction function reduces to g = 0, and the central bank continues to adopt a policy of zero inflation. As before, the effect of elections on monetary and fiscal policy under these conditions can be seen in column F of Table 1 and is summarized in the following hypothesis.

HYPOTHESIS 3. When capital is mobile and the exchange rate is fixed, the government initiates a fiscal expansion during electoral periods, but the central bank maintains its nonelection period policies (whether or not it is independent). Fiscal, but not monetary, expansions are expected during electoral periods.

This result has an important implication for the interaction between the international environment and the central bank. Since the bank does not have effective control over domestic monetary policy when the exchange rate is fixed, it no longer conditions its behavior on that of the government. Thus, it is not surprising that a change from a dependent to an independent central bank is not expected to affect the behavior of either fiscal or monetary policymakers.

Flexible Rates and Fully Mobile Capital. The situation is markedly different under flexible exchange rates. In that case, the Mundell-Fleming model tells us that fiscal policy will be ineffective, and monetary policy will be more effective ($\mu = 1$ and $\phi = 0$). If we insert these

¹³ Using a similar model, Berger (1997b) argues that the West German government exploited just such a position as a Stackelberg leader during the 1950s. The combination of a closed economy and a conservative central bank would give the government the large budgets that it wanted but would force the Bundesbank to fight inflation through monetary policy. The only way the bank could escape this trap was to find a credible external commitment device in the return to convertibility in the context of the Bretton Woods pegged exchange rate system (Berger 1997a).

¹⁴ Chronic deficits may induce capital flight and undermine the fiscal expansion. This flight is expected only when investors lose confidence in the government's ability to repay. Short-term increases in the debt due to electoral cycles are unlikely to cause such flight as long as the government is expected to bring the deficit back to its level in the previous nonelectoral period. See Canzoneri and Diba 1999 for a similar argument applied to the Stability and Growth Pact within Europe.

¹⁵ A Stackelberg equilibrium is a set of strategies such that each player chooses its best response given that one player (in this case the government) chooses first.

values into the government's loss function, the first-order condition becomes

$$\frac{\partial L^{gov}}{\partial g} = 0. {(7)}$$

Thus, the ineffectiveness of fiscal policy leads the government to abandon the manipulation of budgets for electoral purposes.

The central bank pursues its best policy in view of zero net spending by government. During nonelectoral periods, the bank sets inflation in response to inflationary expectations $(\pi_t = (1/(1+\alpha)) \pi^e)$ (refer to Table 1). During electoral periods, inflation is an increasing function of the government's propensity to push growth above the natural rate, if the central bank is dependent $(\pi_t = (1/(1+\alpha))(\pi^e + y^n(k-1)))$, but not otherwise $(\pi = (1/(1+\alpha))\pi^e)$ for both electoral and nonelectoral periods if the bank is independent.

HYPOTHESIS 4. When capital is mobile and the exchange rate is allowed to fluctuate, the government maintains its nonelection period policies throughout the electoral period. If it is independent, then the central bank also maintains its nonelection period policies; if it is dependent, the central bank initiates a monetary expansion during electoral periods. Fiscal expansions during electoral periods are not expected. Monetary expansions are expected during electoral periods only if the central bank is dependent.

Summary and Comparison of Results under Alternative Structural Conditions

The model's predictions regarding the effects of elections on monetary and fiscal policies under various structural conditions were reported in column F of Table 1. Comparisons across the rows in that table produce comparative statics related to the effects of structural change on the policy consequences of elections. According to hypotheses 1 and 2, net government spending will be higher in electoral periods than in nonelectoral periods if there are substantial barriers to capital mobility. This is true regardless of central bank independence. Similarly, hypothesis 3 indicates that net government spending will increase in electoral periods when capital is mobile and exchange rates are fixed (the increase is likely to be greater than in the closed economy case). In contrast, hypothesis 4 suggests that no fiscal expansion is expected when capital is mobile and exchange rates are allowed to float. Note that central bank independence is not important in determining the absence or presence of fiscal cycles when capital is fully mobile.

Unlike fiscal policy, electorally induced monetary cycles are very sensitive to the degree of central bank independence as well as the nature and degree of integration with the international economy. Hypotheses 1 and 2 tell us that electorally induced monetary expansions are not expected when capital mobility is limited. Indeed, monetary contractions are expected when capital is immobile and the central bank is

independent. When capital is mobile, both the degree of central bank independence and the nature of the exchange rate regime condition the effect of elections on monetary policy. Hypotheses 3 and 4 indicate that elections are expected to induce monetary expansion only when the exchange rate is flexible and central bank independence is limited. Otherwise, monetary policy is expected to be free from electoral pressures when capital is fully mobile.¹⁶

A TEST OF THE MODEL'S IMPLICATIONS UNDER FULL CAPITAL MOBILITY

The standard method for testing opportunistic political business cycle arguments is to examine the relationship between various macroeconomic outcomes (such as growth, unemployment, and inflation) and the occurrence of elections. Because our focus is on the strategic interaction between fiscal and monetary policymakers, we examine the instruments that the respective agents are presumed to control. In the preceding theoretical discussion, we maintained the fiction that the central bank controls the rate of inflation directly. We now make the more realistic assumption that the central bank controls the money supply. The government is assumed to control the size of the budget surplus (or deficit).

The model put forth earlier suggests that the relationship between elections and policy instruments depends upon the degree of capital mobility, the exchange rate regime, and the degree of central bank independence. Although we modeled the strategic interaction of monetary and fiscal actors under the hypothetical case of a closed economy to provide an analytical baseline, we will test only hypotheses 3 and 4, which assume fully mobile capital. Following Clark and Reichert (1998), we presume that capital was highly mobile when the Bretton Woods System collapsed. Consequently, our empirical examination concentrates on the period 1973-95. This allows us to treat capital mobility as essentially constant and examine the effects of exchange rate regimes and central bank independence on monetary and fiscal cycles. This coding has limitations, but it follows a tradition that treats capital mobility as a systemwide, rather than country by coun-

¹⁶ We are assuming that these variables are exogenous. It is possible, of course, that capital mobility, the exchange rate, and even central bank independence are themselves choice variables and are endogenous to the model. If the exchange rate regime prevents a policymaker from using an instrument for electoral purposes, and if the exchange rate regime is also under the control of the politician, why would not an opportunistic politician just drop the commitment to the exchange rate regime when it becomes inconvenient? The answer provided by the Mundell-Fleming model is that doing so would not mean gaining an electorally useful instrument but a change in which instrument would be effective for electoral purposes. An election may make policymakers more eager to manipulate the economy, but that alone is not enough to create the kind of endogeneity problem that would bias our tests of the link between policy and elections. More generally, we simply do not observe instances in which governments systematically change the exchange rate regime, the level of capital mobility, or central bank independence before elections. We thank two anonymous reviewers for their comments on

TABLE 2. Electorally Induced Cycles In Macroeconomic Policy under Various Structural Conditions

try, variable (Andrews 1994; Frieden 1991; Hallerberg and Clark 1997; Kurzer 1993; McNamara 1998; Webb 1995). To be sure that this assumption is not what drives our results, we also report regressions that consider the effects of country-specific restrictions on capital movements.

Again following Clark and Reichert (1998), we use a dummy variable interaction model to examine the modifying effects of fixed exchange rates and central banking institutions. We use their codings of participation in fixed exchange rate regimes as well as their dummy variable for central bank independence, updating where necessary. The standard test for political business cycles employs a multivariate regression model aimed at isolating the relationship between elections and macroeconomic variables. We will examine two sets of models to evaluate hypotheses related to budgetary and monetary cycles. Table 2 summarizes the predictions of Table 1 regarding electorally induced monetary and fiscal cycles under full capital mobility.

Monetary Cycles

Our theoretical discussion suggests that the existence of electorally induced monetary cycles is likely to be sensitive to the environment. We will test this using a pooled cross-sectional time-series model that extends the empirical work of Alesina and Roubini (1997).¹⁸ They test for monetary cycles using the following equation:

$$m_{u} = \beta_{0} + \beta_{1} m_{u-1} + \beta_{2} m_{u-2} + \dots + \beta_{n} m_{u-n} + \beta_{n+1} PBCN_{u} + \varepsilon_{t},$$
 (8)

where m_{ii} is the growth rate of money for country i at time t, and PBCN is an electoral dummy variable that equals 1 during electoral quarters and in either (depending on the specific test) the three or five quarters before the election. Adding dummy variables and

interaction terms to capture the context-specific effects of our model, equation 8 becomes:

$$m_{t} = \beta_{0} + \beta_{1}E_{t} + \beta_{2}Cbi + \beta_{3}Fixed_{t} + \beta_{4}E \cdot Cbi_{t}$$

$$+ \beta_{5}E \cdot Fixed_{t} + \beta_{6}CBI \cdot Fixed_{t} + \beta_{7}E \cdot CBI \cdot Fixed_{t}$$

$$+ \Sigma(\beta_{1}m_{t-1}) + e_{t}.$$
(9)

Table 3 reports the pooled cross-sectional time-series results for four specifications. Following Alesina and Roubini (1997), models A and B use the annual rate of change in M1 as an indicator of change in the money supply. To ensure that the results are not driven by the way we operationalize the dependent variable, models C and D use the natural log of a monetary aggregate that includes M1 and quasimoney as the dependent variable.19 Columns C and D also differ from Alesina and Roubini's specification in that we control for macroeconomic conditions that are expected to influence monetary policy. Specifically, it is expected to respond in a countercyclical manner to increased unemployment and inflation with a one-period lag.20 Columns A and C use qualitative indicators of the hypothesized constraints on monetary policy. These specifications implicitly assume that capital was uniformly mobile during the period examined and that central banks were either independent or not. The models in columns B and D relax these assumptions by using continuous measures of capital mobility and central bank independence.21 All models include country dummies to control for country-specific fixed effects as well as a single lagged dependent variable to control for autocorrelation. Since the coefficients on the lagged dependent variables are several standard errors away from one, we are confident that unit root and cointegration problems do not exist. Standard errors were calculated using Beck and Katz (1995) panel-corrected standard errors.

Note that the results of the models are qualitatively similar. Our model suggested that electorally induced monetary expansions should occur if and only if the

¹⁷ Clark and Reichert based their codings of exchange rate restrictions on Coffey 1984; IMF, *International Financial Statistics* (various years b); and OECD 1985. Their dummy variable for central bank independence equals 1 when the score for legal independence is above the median, (see Cukierman, Webb, and Neyapti 1992 for an extensive discussion of this measure).

¹⁸ See Appendix B for data sources and descriptions of indicators.

¹⁹ Unlike M1, quasimoney includes such assets as savings accounts, small-denomination time deposits, money markets accounts, and money market mutual fund shares. When added to M1, their sum is a broader monetary aggregate, often referred to as M2. Given the tendency of asset holders to substitute among them, some scholars argue that the broader indicator is a better measure of the money supply. We use both indicators as a robustness test. Also, use of the broader aggregate allows us to include a wider set of countries in our analysis than would have been possible for M1 alone.

²⁰ Unemployment is measured as the quarterly rate of change in the number of persons unemployed. Inflation is the year-to-year rate of change in the consumer price index. See Appendix B.

²¹ To create a continuous measure of eroding monetary policy autonomy as a result of the interaction between exchange rates and capital mobility, we averaged, inverted, and rescaled on the interval from 0 to 1 the eight capital control variables used in Simmons (1996a) and multiplied this figure by the dummy variable for fixed exchange rates. The latter equals one when the exchange rate is fixed, zero otherwise, so the resulting variable equals zero when the exchange rate is flexible and is an increasing function of the degree of capital mobility when the exchange rate is fixed. This variable and the Cukierman, Webb, and Neyapti legal measure of central bank independence appear as Fixed and CBI in columns B and D of Table 3, respectively.

Note: Numbers are coefficients and panel-corrected standard errors using pair-wise deletion to estimate covariances. Columns B and D use the Culderman, Webb, and Neyapti (1992) measure of legal independence and a continuous measure of eroding monetary policy autonomy (see note 20). Columns A and C use a categorical variable that equals 1 if the country's score is above the sample median, 0 otherwise, and a categorical measure of eroding monetary policy that equals 1 if the exchange rate is fixed, 0 otherwise *p < .05, **p < .01; one-tailed test used for coefficients involving "CBI = central bank independence

central bank is not independent and the exchange rate is allowed to fluctuate. Because the electoral coefficient in Table 3 describes the relationship between elections and the money supply when both modifying variables equal zero, it describes the situation when central banks are dependent and exchange rates are flexible. The statistically significant positive coefficient for *Election* in all four specifications in Table 3 is evidence that monetary expansions occur, as expected, when these conditions prevail.

Furthermore, specifications of equation 9 that use qualitative modifying variables make it easy to test all four implications of hypotheses 3 and 4 related to monetary policy by calculating the conditional coefficients for each relevant institutional combination (refer to Table 2).²² The conditional coefficient for the effect of elections on the money supply when exchange

rates are fixed and the central bank is independent can be determined by substituting the appropriate values of the institutional variables into equation 9.

$$m_{t} = \beta_{0} + \beta_{1}E_{t} + \beta_{2}(1) + \beta_{3}(1) + \beta_{4}(E \cdot (1))$$

$$+ \beta_{5}(E \cdot (1)) + \beta_{6}(1) + \beta_{7}(E \cdot (1) \cdot (1)) + \sum_{i}(\beta_{i}m_{i-j})$$

$$+ e_{t}, \qquad (10)$$

which simplifies to

$$m_{t} = \beta_{0} + \beta_{1}E_{t} + \beta_{2} + \beta_{3} + \beta_{4}E + \beta_{5}E + \beta_{6} + \beta_{7}E + \Sigma(\beta_{t}m_{t-1}) + e_{t},$$
(11)

and then comparing the electoral (E=1) and nonelectoral (E=0) periods in the presence of both constraints. Were a monetary cycle to occur under such conditions, the change in the money supply should be greater during electoral (left side of equation 12) than nonelectoral (right side of equation 12) periods:

²² See Friedrich 1982 and Jaccard, Turnsi, and Wan 1990 for a useful introduction to the conditional interpretation of multiplicative interaction models.

which simplifies to $\beta_1 + \beta_4 + \beta_5 + \beta_7 > 0$. By analogous reasoning, a finding that $\beta_1 + \beta_4 > 0$ or $\beta_1 + \beta_5 > 0$ would be evidence of electorally induced monetary expansion under dependent central banks with fixed exchange rates and independent central banks with floating exchange rates, respectively. Hypotheses 3 and 4, however, predict that monetary cycles will not occur under such circumstances, so we expect that $\beta_1 + \beta_4 + \beta_5 + \beta_7$, $\beta_1 + \beta_4$, and $\beta_1 + \beta_5$ will each be indistinguishable from zero. In contrast, hypothesis 4 predicts that electorally induced monetary expansions will occur when the exchange rate is flexible and the central bank is dependent. As noted above, the test for this last proposition is simply $\beta_1 > 0$.

The conditional coefficients, and their associated standard errors, based on the results in column C of Table 3, are reported in the upper portion of Table 4. Note that the coefficients in Table 4 are estimates of the relationship between elections and monetary policy under the various open economy conditions presented in Table 1. As hypothesis 4 predicts, when capital is mobile, there is evidence of electorally induced monetary expansions if the exchange rate is allowed to fluctuate, but only when central bank independence is limited. As hypothesis 3 predicts, there is no evidence of such expansions when the exchange rate is fixed, regardless of central bank independence.

The lower portion of Table 4, which reports the conditional coefficients and standard errors calculated from column A, suggests that the relationship between elections and monetary policy may be more complicated than our model suggests. As in the upper portion of the table, the results are consistent with hypothesis 4: There is evidence of electorally induced monetary cycles when the exchange rate is flexible, but only when the central bank is dependent. Yet, because they

suggest that electorally induced monetary cycles occur when central bank independence is limited and the exchange rate is fixed (lower right cell), the results in the lower part of Table 4 are not consistent with the monetary implications of hypothesis 3.

One explanation for this anomalous finding is that the Mundell-Fleming model rules out monetary policy as an independent instrument when the exchange rate is fixed, but it also explains why the money supply may nonetheless be tied to the electoral calendar.²³ If, as our model predicts, preelectoral fiscal expansions occur under a fixed exchange rate regime, then the resulting increase in interest rates will put upward pressure on the domestic currency. The central bank is obligated by the exchange rate commitment to counteract this pressure by selling domestic currency, thereby expanding the money supply.²⁴ If this link between monetary and fiscal policy is sufficiently strong, the electorally induced fiscal expansions that, according to hypothesis 3, are expected to occur under fixed exchange may also be reflected in monetary aggregates. The central bank could sterilize the effects of the foreign exchange intervention by engaging in offsetting sales of government securities. Since this would reduce the expansionary consequences of the government's electorally induced fiscal policy, we would expect dependent central banks to be less apt to sterilize than independent ones. The insignificant conditional coefficient for the case of fixed exchange rates and an independent central bank is consistent with this conjecture.

In sum, the evidence supports the main implications of our model for monetary policy. The existence of opportunistic monetary cycles is conditioned by central bank independence and the exchange rate regime. Furthermore, there is evidence of monetary expansion when the government retains national monetary policy and influence over the central bank. There is no evidence of such cycles when the central bank is independent or the exchange rate is allowed to float. Contrary to our expectations, there is some evidence of electorally induced cycles in monetary policy when the exchange rate is fixed. But, in contrast with our other findings, this evidence is not robust with respect to the choice of the aggregate used to measure the money supply, and it could be interpreted as indirect support

²³ We are indebted to Tom Willett on this point.

²⁴ This automatic monetary expansion makes fiscal policy particularly effective when capital is mobile and the exchange rate is fixed. As Fablo Ghiron points out (personal communication), an examination of foreign exchange interventions may allow future researchers to distinguish between electorally induced monetary cycles (as understood in this article) and the monetary consequences of electorally induced fiscal cycles.

²⁵ Alesina and Roubini (1997) find evidence of electorally induced monetary expansion in their sample of 18 OECD countries, but they assume that the occurrence of monetary cycles is uniform within their sample. Our evidence suggests that they inappropriately pooled cases where monetary cycles are expected to occur with those where they are not. Although we did not conduct country-specific tests, our finding is in tension with evidence of an electoral monetary cycle in the United States (Grier 1989) and consistent with studies that find a lack of evidence for such a cycle (Beck 1987). For more on the U.S case, see contributions to Mayer 1990.

for the model's predictions about fiscal policy.²⁶ We now turn to a direct examination of the fiscal policy results.

Fiscal Cycles

In contrast to monetary policy, hypothesis 3 indicates that electorally induced fiscal cycles are likely when exchange rates are fixed and that the effectiveness of fiscal policy on output increases under fixed exchange rates when capital is mobile. Hypothesis 4 predicts that fiscal policy is ineffective when exchange rates are flexible and capital is mobile, and under these conditions there should not be fiscal cycles.

Previous research generally asks whether deficits are likely to increase in electoral years. Unlike the empirical work on monetary cycles, the literature codes data on a yearly rather than quarterly basis.²⁷ The evidence is decidedly mixed. Some authors indicate support for opportunistic fiscal cycles in some subset of industrialized countries (Alesina and Roubini 1997; Hallerberg and von Hagen 1999; Franzese 1996 finds such cycles when the replacement risk to a sitting government is high), and others find no support for such cycles (De Haan and Sturm 1994b). One reason may be that the studies do not differentiate between the effects of fixed and flexible exchange rates or mobile and immobile capital.

We rely on data sets from two recent articles, De Haan and Sturm (1997) and Hallerberg and von Hagen (1999). Our rationale is as follows. Each covers a somewhat different group—De Haan and Sturm (1997) examine 19 OECD countries, and Hallerberg and von Hagen (1998, 1999) use the 15 current members of the European Union.²⁸ Much of the economic data also come from different international organizations.²⁹ If

26 The somewhat different findings with the two monetary measures complicate the interpretation of the results, but the predictions of the model are broadly supported. First, our model predicts that central bank independence will influence electorally motivated monetary, but not fiscal, policy. The lower part of Table 4 supports the notion that central bank independence disturbs the link between elections and monetary policy when the exchange rate floats but not when the exchange rate is fixed, which is consistent with the contention that the observed link under fixed exchange rates is driven by fiscal policy. Second, the conditional electoral coefficients are smaller and their standard errors are larger when the exchange rate is fixed than when the exchange rate floats and the central bank is dependent. This is consistent with the idea that the results for the case of floating exchange rates and a dependent central bank reflect the deliberate manipulation of monetary instruments for electoral purposes, whereas the fixed exchange rate results reflect reverberations from fiscal policy. Finally, the coefficients calculated from tests based on a broader monetary aggregate, which is less likely to reflect exchange rate interventions driven by fiscal policy, show no evidence of electorally induced fiscal policy when the exchange rate is fixed.

²⁷ Quarterly data on expenditures and tax collections can have a seasonal element both within and across countries that is difficult to control for, even with sophisticated econometric techniques.

²⁸ The original Hallerberg and von Hagen data set covers 1981–94. We thank Rolf Strauch for providing updated data for the economic variables. See Appendix B for original sources.

²⁹ De Haan and Sturm rely on *OECD Economic Outlook* for most of their data, whereas Hallerberg and von Hagen drew mostly from *Statistical Annex of European Economy* (see Appendix B). There is a difference in particular in the debt coding rules. The European

we find evidence of politically induced fiscal cycles in both data sets, then we will have more confidence in the robustness of the results. We also restrict the period to 1981-92 for the Hallerberg and von Hagen data set and to 1982-92 for the De Haan and Sturm data set. We did this for two reasons, both of which concern policy in Europe: In fall 1992 the Exchange Rate Mechanism suffered a severe crisis in the markets, which put in doubt the credibility of fixed exchange rates; and after 1992 states that wished to join the Economic and Monetary Union faced restrictions on their debt levels, which presumably had a direct effect on fiscal policy. The beginning date of the respective data sets is the same as in the published articles, and we want to emphasize that this period is theoretically interesting. Several European Community countries reestablished credible fixed exchange rates with the Exchange Rate Mechanism in 1979, and both data sets allow strong tests of whether a country's exchange rate regime affects the likelihood of fiscal expansion before an election.

The model upon which these articles build, and which has become a standard in the field, is that of Roubini and Sachs (1989). Their regression equation is

$$db_{u} = \beta_{0} + \beta_{1}db_{u-1} + \beta_{2}dU_{u} + \beta_{3}dy_{u} + \beta_{4}b_{u-1}d(r_{u} - y_{u}) + \beta_{5}pv_{u},$$
(13)

where the dependent variable, db_u , is the change in the ratio of gross debt to GDP. The equation contains a set of economic variables and a set of political variables (represented as pv_{μ}). The economic variables are: db_{u-1} , the lagged debt ratio; dU_{i} , the change in the unemployment rate; and $b_{u-1}d(r-y)$, the change in debt servicing costs, which is computed as the change in the real interest rate minus the change in the growth rate times the gross deficit in the previous year. In addition, some authors include the change in real GDP, dy_i . To be consistent with previous work, we include that change in our regression using the data of Hallerberg and von Hagen, as they do, and we follow De Haan and Sturm by not including it in our regression with their data.30 These economic variables are expected to influence the budget in a given year; higher levels of unemployment and debt servicing costs should increase government debt levels, and higher levels of economic growth should decrease debt levels.31

The standard political variables generally include codings for institutional differences or the partisanship orientation of the government. Roubini and Sachs (1989) received much attention for their finding that

Commusion uses Maastricht definitions for debt and inflation, which have minor accounting differences with the OECD data.

³⁰ There is some controversy about including growth in GDP as an independent variable because real GDP appears in the denominator on the left-hand side of the equation (see also Borelli and Royed 1995). We are not interested in this controversy per se, so we follow the practice of the respective authors.

³¹ These expectations are only valid for industrialized nations. Talvi and Végh (1997) find that the sign on economic growth is reversed in Latin American countries. They hypothesize that governments can only justify painful cuts in expenditures or increases in taxes to their constituencies when economic conditions worsen

the type of government affects the size of budget deficits. One-party majority governments maintain the tightest fiscal discipline, two- or three-party majority governments less so, and four- or five-party governments even less; minority governments, regardless of the number of parties in the coalition, are the most undisciplined. Many other researchers have examined government type and other political variables. As control variables, we use the political variables in De Haan and Sturm (1997) as well as Hallerberg and von Hagen (1999). De Haan and Sturm found that Roubini and Sachs made several coding errors and, based on the original coding procedures, argue that the type of government does not affect deficit levels.

Hallerberg and von Hagen, following Edin and Ohlsson (1991), break the government type variable into three separate dummies and add a variable—the percentage of cabinet portfolios held by leftist parties—to control for partisan effects. They also add variables for election years and for two fiscal institutions, a strong finance minister and negotiated targets. Among their findings were a connection between government type and a fiscal institution that is meant to reduce the size of deficits, but no effect of government type per se on the size of deficits. In particular, delegation to a strong finance minister who can monitor spending ministers and punish those who "defect" is feasible in states with one-party majority governments. In multiparty and minority governments, the coalition members are not willing to delegate such power to one actor. Commitment to numerical targets negotiated among the coalition partners for each ministry provides an alternative in multiparty govern-

In order to test our contention that political business cycles are most likely to occur when exchange rates are fixed, we structure the regression equations to include the economic and political factors noted above as well as variables to consider the effects of exchange rate regime and of elections. Our equations are:

$$db_{u} = \alpha + \beta_{1}Election + \beta_{2}Flexible + \beta_{3}Election$$

$$\times Flexible + \beta_{4}db_{u-1} + \beta_{5}dU_{u} + \beta_{6}b_{u-1}d(r_{u} - y_{u})$$

$$+ \beta_{7}Government Type, \qquad (14)$$

when employing the De Haan and Sturm data, and $db_{u} = \alpha + \beta_{1}Election + \beta_{2}Flexible + \beta_{3}Election \\ \times Flexible + \beta_{4}db_{u-1} + \beta_{5}dU_{u} + \beta_{6}b_{u-1}d(r_{u} - y_{u}) \\ + \beta_{7}dy_{u} + \beta_{8}Two\text{-Three Party Govt.} \\ + \beta_{9}Four\text{-Five Party Govt.} + \beta_{10}Minority Govt. \\ + \beta_{11}Strong Finance Minister \\ + \beta_{12}Negotiated Targets$

+ β_{13} Strong Finance Minister × Election + β_{14} Negotiated Targets × Election + β_{15} Left, (15)

when the Hallerberg and von Hagen data are used, where β_1 is the coefficient when there are elections under fixed exchange rates, β_2 is the coefficient for flexible exchange rates and no elections, and β_3 captures the effect of a change to a flexible exchange rate on the relationship between the debt and elections. This specification of the variables follows closely the model provided in the section on monetary policy. Our expectations about the effects of these variables differ, however. Based on hypotheses 3 and 4 presented in Table 1, we expect fiscal expansions to occur only when exchange rates are fixed (i.e., when Flexible is equal to zero). When exchange rates are flexible, we expect that fiscal policy is ineffective and a government will not initiate a preelectoral fiscal expansion.

Because of our interest in the effect of elections under different exchange rate regimes, we consider two alternative methods for coding elections. Hallerberg and von Hagen (1999) calculate their election variable as a dummy for years in which an election is held. This follows standard practice in the literature but is at best inexact and at worst inaccurate. Some countries hold elections in early spring, others in late autumn. The same country may even hold elections in different times of the year over different electoral cycles; for example, in the United Kingdom, there were two elections in 1974, in February and October, and just five years later elections were in May. A variable that makes no distinction among these presumably will understate the effect of elections as well as increase the standard error.

We supplement the standard measurement of elections with Franzese's (1996) more exact definition. He calculates Election as the proportion of preelectoral year; for example, a February 1 election would be coded as 1/12 in that year and 11/12 in the previous year.33 We applied this coding to the two data sets to see whether the coding rules affected the results. Our model predicts that fiscal cycles should occur when exchange rates are fixed, which in our regressions is the case when election equals 1 and flexible equals 0. The sign of election should therefore be positive. The model also predicts that the coefficient for the interaction term election × flexible should be negative; indeed, since governments have no incentive to use fiscal cycles when exchange rates are flexible, one expects that the coefficients for election and election × flexible will sum to zero. To test directly for the effect of flexible exchange rates on fiscal cycles, we also calcu-

³² Hallerberg and von Hagen (1999) refer to a strong finance minister as a "delegation" approach and to negotiated targets as a "contract" approach.

³³ In particular, Franzese codes elections for relevance to economic policy. Policy-relevant elections can include, for example, presidential elections in Finland, France, and the United States as well as upper house elections. He then divides the value of the variable between those separate elections, so that, for example, a French presidential election and a French parliamentary election are each coded. 5.

TABLE 6. Conditional Coefficients for Elections with the Hallerberg and von Hagen (European Union) Data Set under Fixed Exchange Rates and Different Fiscal Institutions

Neither targets nor strong finance minister	2.97** (1.13)
Targets only	0.45 (1.09)
Strong finance minister only	2.40 (2.37)
**p < .01.	

lated the conditional coefficient for elections when exchange rates are flexible and when they are fixed.

Table 5 reveals strong evidence that countries with fixed exchange rates experience fiscal cycles and that flexible exchange rates eliminate these cycles. In all the equations with the more precise measure for elections, the positive and significant conditional coefficient means that preelectoral fiscal expansions occur when the exchange rate is fixed but not when it is flexible. For example, in column B the coefficient for election indicates an increase in the gross debt level of roughly 1.5 points during electoral periods when the exchange rate is fixed, compared to no increase during electoral periods when the rate is flexible, that is, when the sum of the coefficients for election and election \times flexible is close to zero (for convenience, we present the conditional coefficients for each exchange rate regime and their associated standard errors in Table 5). The effect of exchange rate regime on the relationship between budgets and elections is most dramatic with the second equation using the Hallerberg and von Hagen data set (column E): States with fixed exchange rates will increase their ratio of gross debt level to GDP almost three percentage points in the year before an election.

This difference in the effect of the electoral period in the two data sets may be the result of the institutional variables added by Hallerberg and von Hagen. Most important, because models D, E, and F employ interactions between election and Strong Finance Minister and election and Negotiated Targets, the interpretation of the conditional coefficient changes. The coefficient for election now summarizes the relationship between elections and gross debt when the exchange rate is flexible in the absence of a strong finance minister or the use of negotiated targets.

Table 6 computes conditional coefficients for the effect of fiscal institutions. In both cases the fiscal institution eliminates the increase in debt before elections. It appears, therefore, that these domestic institutions constrain fiscal policy in much the same way that central bank independence constrains monetary policy.

There are additional nuances in the results given in Table 5. As columns A and D indicate, the standard election variable has the correct sign but is not significant when we do not use the Franzese coding for

elections. In both data sets, however, the effect almost doubles, and the standard deviation decreases, when Franzese's more exact measure is used (columns B and E). Once again, fiscal electoral cycles are completely absent when exchange rates are flexible.³⁴

Models C and F in Table 5 allow us to test the robustness of our results by relaxing the assumption that capital was fully mobile in every country during the entire observation period. Similar to the coding of "no monetary policy autonomy" in the previous section, we created a variable called "no fiscal policy autonomy (nofpa)" and substituted it into the regressions for flexible. This continuous variable is the product of the Simmons (1996a) coding of capital controls and the exchange rate regime dummy variable. It ranges from zero (when flexible = 0 and/or there are no capital controls) to 1 (when flexible = 1 and all capital controls are present). The findings are qualitatively the same as for the regressions that use a rougher measure of capital mobility: Elections are associated with an increase in government debt when fiscal policy autonomy is retained (compare the coefficient on election in columns C and F), but this relationship is diminished when fiscal policy autonomy erodes (compare the coefficient on the interaction term). This provides indirect support for our earlier contention that capital was more or less mobile during the period examined.

The results fit our expectations. There is evidence of preelectoral fiscal expansion when the exchange rate is fixed, which confirms hypothesis 3. The conditional coefficient for elections is positive and highly significant. In comparison, when we hold relevant domestic institutions constant and move to a flexible exchange rate, in all cases the size of the conditional electoral coefficient is reduced. This result holds for all combinations of domestic fiscal institutions, and it confirms hypothesis 4: All else equal, the conditional coefficient for elections is always greater under a fixed exchange rate than a flexible regime.

EXTENSIONS OF MODEL 1: PARTISAN POLITICAL BUSINESS CYCLES

We have concentrated on the effects of international conditions as well as domestic political institutions on the propensity of governments to engineer preelectoral expansions of either the money supply or the budget deficit. Our model also allows us to consider how these international and domestic factors can be integrated into a second tradition in political economy, namely, whether partisan differences systematically translate into differences in macroeconomic policy. One school contends that there is a clear divide between the policies that left and right governments pursue. Compared to rightists, leftists are expected to prefer higher inflation and the higher employment that accompanies it and to support a consistently higher level of the

³⁴ In unreported results, we restricted the De Haan and Sturm data just to European Union countries to test whether the differences between the two data sets were due to regional factors, but the gap remained.

money supply. This view is largely based upon the assumption of a stable Phillips curve tradeoff between inflation and unemployment. In terms of fiscal policy, leftist governments run larger budget deficits than rightist governments, again to boost employment. The reasoning behind these arguments is straightforward—leftist governments appeal to their supporters, who are usually laborers, whereas rightist governments appeal to their backers, who are usually capital owners (the classic article is Hibbs 1977).

There is some debate about how internationalization affects the likelihood of partisan cycles. As we stated earlier, several scholars insist that global capital mobility will end the ability of leftist governments to act differently from rightist governments (in addition to earlier citations, for literature surveys see Garrett 1998, chap. 1, and Clark n.d., chaps. 4 and 6). Capital will simply move to the country where it is best treated, and there will be an inevitable harmonization of policy as capital becomes more mobile. Others, such as Garrett (1995, 1998) and Rodrik (1997), insist that partisan differences will remain or even increase in the face of more internationalization. Populations become more uncertain in a global world and demand an expansion of the welfare state rather than a contraction. Clark (n.d.) finds no evidence of partisan cycles before or after an increase in internationalization. In a study with some similarity to ours, Oatley (1999) examines how fixed and flexible exchange rates together with increasing capital mobility affect partisan cycles. Based on a Mundell-Fleming framework, he argues that there are partisan monetary cycles in the form of real money market interest rates that go away when there is open capital and a fixed exchange rate regime, and there are partisan fiscal cycles in the form of larger budget deficits that disappear when there is open capital and a flexible exchange rate regime.35

A useful feature of the formal model we developed earlier is the ease with which it can be applied to the partisan debate. Recall that the variable which differentiated between periods before and not before elections was k, which we assumed was greater than 1 in election periods and equal to 1 in nonelection periods. Since k is the parameter that captures the propensity of policymakers to push output above the natural rate, it can be interpreted as a function of the expansionary tendencies of the government. Consequently, an extension of the model is to replace "election" with "leftist government" in the model and to test the resulting hypotheses with data that interact partisanship with the relevant structural conditions.

Hypothesis 5. Our expectations about the effect of partisanship are as follows.

- A. When capital is immobile and the central bank is dependent, leftist governments will create fiscal but not monetary expansions.
- B. When capital is immobile and the central bank is independent, leftist governments will create fiscal expansions and monetary contractions.
- C. When capital is mobile and the exchange rate is fixed, leftist governments will create fiscal but not monetary expansions, regardless of central bank independence.
- D. When capital is mobile and the exchange rate is flexible, leftist governments will create monetary but not fiscal expansions, unless the central bank is independent.

If the partisan literature is correct and there is a fundamental difference between the preferences of leftist and rightist governments, then we expect the following for monetary policy under leftists: monetary contractions when capital is immobile and the central bank is independent; monetary expansions when capital is mobile, the exchange rate is flexible, and the central bank is dependent; and no change in policy under the remaining conditions. For fiscal policy, under leftists there will be fiscal expansions when capital is immobile and central banks are dependent as well as when capital is mobile and exchange rates are fixed, but otherwise no partisan differences should be evident.³⁶

To test these hypotheses, we begin with the same empirical models used earlier. This facilitates a ready comparison with the opportunistic political business cycle results as well as with the literature that established these models. In place of the electoral variables we use a variable for partisanship based on Woldendorp, Keman, and Budge (1998). The variable takes a value of 1 for right-wing dominance and 5 for left-wing dominance, and it follows Oatley's (1999) coding.

The results for the test of partisan differences in monetary policy—conditioned on both the exchange rate regime and the degree of central bank independence—are presented in Table 7. Since the coefficient for Partisanship describes the expected causal effect of a one-unit increase in leftist governance when central bank independence is limited and the exchange rate is flexible, hypothesis 5D predicts that this coefficient should be positive and statistically significant. The fact that it is positive but not significant in columns A and B and significant but negative in columns C and D means that, under the conditions in which partisanship is likely to matter the most, there is no evidence for the predicted effect of the ideological orientation of government.

As was the case with our examination of the consequences of elections, it is possible to test the partisan

³⁵ Oatley notes that his results disappear in the 1990s, which, because that is the period when capital arguably became most mobile, would seem to be prima facie evidence against his argument. More generally, he finds supporting evidence for approximately half the hypotheses.

³⁶ Note that the inclusion of the central bank as an important actor leads to somewhat different predictions from those of Oatley (1999). In particular, we expect independent central banks to prevent monetary expansions, and they even may lead to monetary contractions under leftist governments when capital is immobile. Moreover, under conditions of immobile capital and a dependent central bank, the partisan cycle shows up in our model only on the fiscal side.

hypothesis under each of the logically possible structural conditions by calculating conditional coefficients and standard errors. These are reported in Table 8. The results in the upper portion of the table, which are calculated from column C in Table 7, are particularly surprising. As noted above, when the government is expected to have the greatest control over monetary policy (i.e., when the exchange rate is flexible and the central bank is dependent), leftist government leads to a monetary contraction rather than a monetary expansion. The upper left-hand cell, however, shows that when monetary policy is controlled by a highly independent central bank, leftist government is associated with monetary expansion. Thus, the results for the case of flexible exchange rates are exactly the opposite of what we might expect; the sort of differences in monetary policy predicted by the partisan model are found only when the central bank is highly independent. Consistent with our argument about the constraining effects of fixed exchange rates on monetary policy, there is no evidence of partisan differences in monetary policy when the exchange rate is fixed—regardless of central bank independence.

The results calculated from column A of Table 7 also

are not very supportive of the partisan hypothesis. As predicted, there is no evidence of partisan differences in monetary policy when the central bank is independent, the exchange rate is fixed, or both. Yet, there is no evidence of partisan differences when they should be most readily observed—when the exchange rate is flexible and the central bank is dependent. To summarize, the only indication that leftist governance results in an expansion of the money supply occurs when the central bank is highly independent, and this result is not robust with respect to the choice of indicator for the dependent variable.

The fiscal policy results also have idiosyncrasies that are not consistent with the standard partisan argument. Table 9 presents regressions that parallel those we reported in the opportunistic business cycle case. Note that columns A and C assume full capital mobility during the period, but columns B and D relax this assumption. Because, in the presence of the interactive term, the coefficient on the partisanship variable indicates the effects of partisanship when the exchange rate is fixed, our expectation from hypothesis 5C is that this coefficient should be positive. We also anticipate that this effect should disappear when the exchange rate is

flexible (columns A and C) or when there is an erosion of fiscal policy autonomy (columns B and D). In the first two columns the variable is not significant. There appears to be no evidence of partisan cycles in the OECD data set. In the last two columns, which add domestic fiscal institutions and are restricted to current EU members, partisanship does seem to have an effect, but the sign is the opposite of what the model predicts. Based on hypothesis 5D, the results indicate that a move to the left reduces the size of growth in the debt burden. Moreover, the conditional coefficients reported in column C indicate that this effect goes away when flexible exchange rates are in place.

To be able to interpret these coefficients, we must consider the relevance of the domestic institutions in the regressions. As in the opportunistic cycle results, the conditional coefficients for partisanship are for the absence of both a strong finance minister and budgetary targets. Table 10 calculates the conditional coefficients for partisanship under different domestic institutional configurations when exchange rates are fixed, which is when we expect partisanship to have an effect. When both fiscal institutions are absent, a move to the left decreases the growth of the debt. When targets are in place, however, a move to the left increases the debt, and there is no partisan effect at all under a strong finance minister.

In general, for both monetary and fiscal policy the predictions of partisan cycles are not borne out. In no case is there evidence of partisan cycles consistent with the predictions about the effectiveness of either monetary or fiscal cycles under given structural conditions. A move to the left leads to an expansion in the money supply only in the most unlikely cases, when the central bank is independent or when spending is constrained by negotiated targets. In the fiscal regressions, there are no partisan effects at all with the OECD data set, and the results are the opposite of those predicted with the EU data set.

EXTENSIONS OF MODEL 2: IMPLICATIONS FOR EUROPEAN ECONOMIC AND MONETARY UNION

Our evidence from Europe in the 1980s and early 1990s indicates that opportunistic fiscal cycles are especially prevalent when capital is mobile and exchange rates are fixed. This result has an important implication for the likely conduct of fiscal policy under the Economic and Monetary Union in Europe. Fixed exchange rates and mobile capital will be the norm in all EU countries that adopt the common currency, either in the first wave on January 1, 1999, or thereafter.³⁷

Although preparations for EMU may have reduced fiscal electoral cycles in the 1990s, it is by no means clear that EMU will restrict fiscal cycles. More generally, there is some concern that governments, once accepted into EMU, will have an incentive to renege on their commitment to lower deficits. Excessively high deficits can both increase inflation and depreciate the euro, and a state can hope to gain the political benefits from high deficits under a common currency without suffering the costs as long as the other states maintain their budget discipline. Another concern is that the deficits can become so large that a state cannot hope to pay back its debt without a bailout from the EU. Because the bailout would be paid for by all EU citizens but would reduce directly just the deficit of the country threatening default, states may have an incentive to run larger deficits than they would if the EU did not exist.38

The member governments are not ignorant of this situation. The Treaty of Maastricht explicitly bans any EU bailout of members, and the states have established a procedure both to monitor the participants and punish any defectors under the Stability and Growth Pact to which the European Council agreed in June 1997. The European Commission will monitor the fiscal health of member states and will report to the Council of Ministers on whether, in its opinion, a deficit greater than 3% is "excessive." The Council of Ministers will then decide whether to accept the commission's assessment. If a country's deficits are deemed excessive, the transgressor will be sanctioned. The offender must make a noninterest bearing deposit with the European Commission equal to .2% of GDP plus an additional .1% per 1% over the 3% limit. The entire process should take ten months; if the country has not

³⁷ We want to be clear about one important difference between the EMU case and the more general cases examined in the empirical section of the article. As explained in note 10, when countries control both fiscal and monetary policy, a fiscal expansion under a fixed exchange rate leads to a reinforcing monetary expansion to maintain the exchange rate. With monetary policy controlled by the European Central Bank, however, states face a "fixed" exchange rate, but they do not anticipate a similar expansion of the money supply Therefore, the effect of the fiscal expansion may be less pronounced in EMU countries than in others that still have a central bank that controls the money supply. We thank Fabio Ghironi for thoughtful comments on this issue.

^{**} Elchengreen and Wyplosz (1997) provide a good discussion of the different rationales for the Stability and Growth Pact.

reformed its budget to the European Council's satisfaction within that time, the deposit becomes a fine.39

Whether the pact will deter states from running chronic deficits is debatable, but clearly it will not discourage opportunistic political business cycles because of the timing of its different procedures. Consider Germany, which traditionally has elections in the fall. A government could promote a large fiscal expansion in the spring and summer that leads to large deficits. In principle, the European Commission could immediately inform the European Council and begin proceedings, but in practice the commission is likely to wait until the final annual budget figures are published in March of the following year, it would fear losing credibility if the preliminary figures prove incorrect.40 An additional ten months would pass before fines can be imposed, and only if the government is not taking corrective measures. In other words, any government can push up the deficit shortly before elections so long as it is cut back again after the elections.41

An alternative is for states themselves to place domestic institutional constraints on their spending behavior. Consistent with Hallerberg and von Hagen (1999), our empirical results indicate that either commitment to negotiated budget targets or delegation to a strong finance minister reduces preelectoral fiscal cycles. A move to one of these institutions may be in order. More generally, because the temptation to use fiscal policy for short-term electoral gain will be greater under EMU, states may have the incentive to develop such institutions only if they are sure that the EU will not bail them out. Indeed, based on an analysis of federal systems, Eichengreen and Von Hagen (1996a) argue that a formal bailout rule is not even needed as long as states maintain their ability to raise revenues.

39 The text of the agreement appears in Committee on Economic and Monetary Affairs and Industrial Policy 1997.

40 Personal interviews with two members of Directorate General II,

June and July 1997.

The EU can simply say "no," much as California did in the mid-1990s when Orange County's creditworthiness plummeted. States may then learn through trial and error to introduce more prudent fiscal policy management. A possible precedent again comes from the United States, where fiscal mismanagement eventually led 47 of 50 American states to pass some form of fiscal policy restriction (Eichengreen and von Hagen 1996b). These changes obviously were not driven by concerns about what state budget deficits could do to the value of the dollar, but by "domestic" concerns about the effects on home populations. These institutional rules also seem to have benefits: States with tighter antideficit rules as well as restrictions on the authority of the legislature pay lower interest rates on their bonds (Poterba and Rueben 1998).42

CONCLUSION

Our model makes fairly weak assumptions about the preferences of monetary and fiscal agents but very strong assumptions about the institutional constraints under which they operate. The strong assumptions about the Mundell-Fleming conditions are intended in part to make the analysis tractable, but they have the added benefit of stacking the cards in favor of falsification: If the predictions based on such a stark model withstand provisional tests, then there are good reasons to believe further refinement will be fruitful. Indeed, the empirical results support the insights of the model. Preelectoral monetary expansions are likely in states with mobile capital, a flexible exchange rate, and a dependent bank and are absent otherwise; preelectoral fiscal expansions are likely under mobile capital and fixed exchange rates.

These results have several interesting implications for the relationship between institutions and the international environment. In the presence of mobile capital, the exchange rate regime constrains the ability of policymakers to use one of the two macroeconomic instruments before elections. When governments change their exchange rate regime, one should expect a change in the incumbents' behavior before an election. If a government fixes its currency when capital is mobile, for example, one would expect a shift from monetary to fiscal policy instruments. It can be argued that such a shift is occurring in Britain. Under Stage III of EMU, EU members anticipate the eventual creation of Exchange Rate Mechanism II for countries that do not join the common currency. The expectation is that the band around the euro for these currencies will progressively narrow, so that these countries will also experience essentially fixed exchange rates. Preelection monetary expansions will become less effective than fiscal expansions.

⁴¹ One additional tool that could be used to restrict governmental abuses will also be absent under EMU. In this article we have assumed that the decisions to pursue capital mobility or fixed exchange rates are exogenous. One could argue, of course, that when banks are independent and governments are especially fiscally irresponsible the bank may decide to stop defending the currency and simply let it float, putting the country in the flexible exchange rate capital mobility scenario that is advantageous to the bank. Under EMU, however, this is extremely unlikely.

⁴² The ultimate form these institutions should take is still open to discussion Strauch (1998) finds that numerical restrictions on the size of the deficit do restrict the size of the deficit. Von Hagen (1998) notes, however, that such numerical restrictions can merely encourage politicians to be more creative with their accounting, and he suggests more centralized procedures to ensure that someone monitors the actors.

There also are implications for the selection of institutions by governments. When considering the tradeoffs involved in enhancing central bank independence, a government may consider what it gives up in terms of survival in the next election if it relinquishes monetary policy autonomy in exchange for greater general price stability with a more independent central bank. A government in a flexible exchange rate economy will lose its ability to influence outcomes with macroeconomic policy before an election if it makes the bank more independent. If the government moves the country to a fixed exchange rate regime, however, it can gain some price stability and still maintain the ability to manipulate the economy before an election. Our work suggests, for example, that Chancellor of the Exchequer Brown would have lost little maneuverability for his government before the next election by granting the Bank of England greater independence in May 1997. The government presumably can initiate a fiscal expansion before the next election so long as Britain has joined Exchange Rate Mechanism II by then. Counter to Bernhard and Leblang (1999), in the absence of central bank independence, governments that peg their exchange rates when capital is mobile do not sacrifice their ability to pursue electoral goals. Instead, they change the instrument with which they can do so.

Our study suggests why previous empirical research on fiscal cycles has yielded ambiguous results. Few studies consider the effects of different exchange rate regimes on the likelihood of fiscal cycles. States engineer fiscal expansions when exchange rates are fixed but not when they are flexible, and works that do not include the exchange rate regime are missing this critical variable. One article that does consider the exchange rate factor, by Clark and Reichert (1998), appears to contradict the results reported here. The authors find that states with either fixed exchange rates or independent central banks are less likely to experience opportunistic political business cycles. Yet, they concentrate on outcomes, such as the unemployment rate and economic output, rather than on policy instruments, such as the money supply or budget balances. Our research produces an interesting puzzle: If fiscal cycles exist when monetary policy is constrained by fixed exchange rates or a highly independent central bank, why do Clark and Reichert find no evidence of cycles in unemployment or growth under precisely these conditions? A possible explanation is that politicians use monetary policy before elections to affect the general economy but manipulate fiscal policy to sway specific constituencies. Indeed, although an increase in the money supply may help certain groups—such as home buyers—more than others, it is a blunt instrument for cultivating specific clienteles. Fiscal policy, in contrast, is more suited to targeted use, whether through greater spending, tax cuts, or both. The implication is that these different strategies have markedly different macroeconomic consequences.

Finally, it is clear that the choice of exchange rate regime and the degree of capital mobility have complex effects on the ability of politicians to influence the economy for electoral purposes. Our study does not necessarily contradict the growing literature on the effects of increased capital mobility on national policy autonomy, but it shows that the effects of capital mobility vary a great deal across cases, both because they are refracted by the institutions through which they are transmitted, such as central banks, and because exchange rate regimes interact with capital mobility in important ways.

APPENDIX A. DERIVATION OF PROPOSITION 1

The reaction functions in proposition 1 follow directly from the actor's loss functions and the Phillips curve mechanism. The government's problem is to choose g so as to minimize its loss function. If we substitute in the Phillips curve process of equation 4, which determines y, and the right-hand side of equation 2 for the government's ideal point for output, and if we assume (without loss of generality) that $\pi^{\bullet}=0$, the loss function becomes:

$$L_1 = (y^n + \mu(\pi - \pi^e) + \phi g - k^{\mu\nu\nu}y^n)^2 + \alpha \pi^2.$$
 (A-1)

To find the minimum, we take the partial derivative with respect to g:

$$\frac{\partial L}{\partial g} = 2\phi(y^{n} + \mu(\pi - \pi^{n}) + \phi g - k^{n}y^{n}), \quad (A-2)$$

which, when set equal to zero and solved for g, becomes

$$g = \frac{1}{\phi} [y^{n} (k^{p \cdot r} - 1) - \mu(\pi - \pi^{r})]$$
 (A-3)

as proposed.

An analogous process can be used to determine the central bank's optimal response. The problem is to find the level of inflation that minimizes its loss function. Once again, substituting the Phillips curve process of equation 4 as well as the right-hand side of equation 3 for the bank's ideal point for output, and assuming (without loss of generality) that $\pi^* = 0$, the bank's loss function is:

$$L_{ab} = (y^n + \mu(\pi - \pi^n) + \varphi g - k^{ab}y^n)^2 + \alpha \pi^2$$
. (A-4)

Differentiating with respect to π yields:

$$\frac{\partial L}{\partial \pi} = 2\mu (\mathbf{y}^{\mathbf{a}} + \mu(\pi - \pi^{\mathbf{a}}) + \phi \mathbf{g} - \mathbf{k}^{\mathbf{c}\mathbf{b}}\mathbf{y}^{\mathbf{a}}) + 2\alpha\pi, \quad (\mathbf{A}-\mathbf{5})$$

which, when set to zero and solved for π , becomes

$$\pi = \frac{1}{\mu + \frac{\alpha}{\mu}} [\mu \pi^{e} + y^{e}(k^{cb} - 1) - \phi g] \qquad (A-6)$$

as proposed.

APPENDIX B

We will briefly describe indicators used in the empirical section. These fall into two categories: institutional/political and macroeconomic.

Institutional/Political Variables

Given the qualitative nature of our theoretical discussion, we elected to classify our observations primarily according to

categorical distinctions. Central banks are viewed as independent or not; exchange rates are fixed or flexible. We have neither strong theoretical arguments about such operational choices nor reason to believe that the strategic calculations of policymakers are influenced in a linear fashion by changing degrees of capital mobility or central bank independence. Table B-1 reports the classifications we used.

Central Bank Independence: The Cukierman, Webb, and Neyapti (1992) measure of legal independence was used to construct a categorical variable that equals 1 if the country's score is above the sample median, 0 otherwise.

Elections: For monetary tests, quarters in which a general election is held, and the three preceding quarters, are coded as electoral periods. Dates for elections are taken from Mackie and Rose (1982) and Europa World Year Book (various years). For fiscal tests, we used either the year in which an election was held, with the data provided in Hallerberg and von Hagen (1999) and based on the yearly data appendix in European Journal of Political Research (various years), or the percentage of time in a given year before an election for a body important for macroeconomic policy as coded by Franzese (1996) and updated by the authors May 1998. (More details for this data source are provided in note 33.)

Fixed Exchange Rates: This categorical variable equals 1 when a country either belongs to a fixed exchange rate regime or pegs its currency to another national currency, 0 otherwise. Codings are based on the IMF's Exchange Arrangements and Exchange Restrictions (various years a).

Fiscal Institutions—Strong Finance Minister and Negotiated Targets: These variables are coded 1 when the institution is present, 0 otherwise. Strong finance ministers generally serve as agenda-setters on the budget, have monitoring functions over the budgets of other ministries, and can strike

out spending on some occasions when it is deemed excessive. Negotiated targets are present when coalition partners negotiate budgets for every ministry. The alternative, termed the "fiefdom" approach, is for coalition partners to negotiate the distribution of cabinet portfolios and cabinet meetings among all ministers who determine the budget. Data appear in Hallerberg and von Hagen (1999).

Left: This variable is the percentage of cabinet seats held by leftist parties. It is coded from the data on cabinet compositions in Woldendorp, Keman, and Budge (1993) and from the yearly data appendix in European Journal of Political Research (various years).

Government Type: Roubini and Sachs (1989) code this variable as follows: 0 = one-party majority government, 1 = 2-3-party majority government, 2 = 4-5-party majority government, 3 = minority government. Our data for this variable come from De Haan and Sturm (1997), who update the data set of Roubini and Sachs. Edin and Ohlsson (1991) break this variable into three separate dummies. Hallerberg and von Hagen (1999) use this formulation, and we received the data which are based on the yearly data appendix in European Journal of Political Research (various years), from them.

Partisanship: Data for this variable come from Woldendorp, Keman, and Budge (1998). The coding they use is for the political complexion of parliament and government. The values range from 1 for right-wing dominance to 5 for left-wing dominance. Note that they do not have data for Greece, Portugal, Spain, and the United States. With the exception of Portugal, these countries have governments that are clearly on the Left or Right, and we code them ourselves (1 if a right-wing government was in place, 5 if a left-wing government was in place).

Macroeconomic Variables

Change in Debt Costs: The change in debt servicing costs is computed as the change in the real interest rate minus the change in the growth rate times the gross deficit in the previous year. Real interest rate data for the De Haan and Sturm regressions came from OECD Economic Outlook (various years a), while the data for the Hallerberg and von Hagen regressions came from Statistical Annex of European Economy (various years).

Change in Gross Debt: This variable is expressed in terms of gross government debt over GDP. The data for the De Haan and Sturm regressions came from OECD Economic Outlook (various years a), and the data for the Hallerberg and von Hagen regressions came from Statistical Annex of European Economy.

Growth: For monetary tests, growth in output was measured by seasonally adjusted total industrial production, except for Canada (where data were not seasonally adjusted) and Australia (where seasonally adjusted real gross product volume was used), from OECD Main Economic Indicators (various years b). Other studies have used change in real GDP, but seasonally adjusted quarterly data were unavailable for several countries. For fiscal tests, figures for the De Haan and Sturm regressions came from OECD Economic Outlook (various years a), and data for the Hallerberg and von Hagen regressions came from Statistical Annex of European Economy (various years).

Inflation: This variable was based on the consumer price index for all goods, except for Japan (all goods less food). It was calculated as $(Cpi_t/Cpi_t - Cpi_{t-4})$. The source was International Monetary Fund, International Financial Statistics, CD-ROM version.

Long-Term Interest Rates: Data for the De Haan and

Sturm regressions came from OECD Economic Outlook (various years a), and data for the Hallerberg and von Hagen regressions came from Statistical Annex of European Economy (various years).

Money Supply: M1 and M1 + quasimoney came from OECD, OECD Main Economic Indicators (various years b). Unemployment: For monetary tests, the quarterly percent-

Unemployment: For monetary tests, the quarterly percentage change in the seasonally adjusted number of unemployed was used, from OECD, OECD Main Economic Indicators (various years b). For fiscal tests, unemployment figures for the De Haan and Sturm regressions came from OECD Economic Outlook (various years a), and data for the Hallerberg and von Hagen regressions came from Statistical Annex of European Economy (various years).

Reflections on Fear: Montesquieu in Retrieval

COREY ROBIN Brooklyn College, City University of New York

ccording to most scholars, Montesquieu argues that fear threatens a loss of self. Disconnected from the exercise of reason, fear is an emotion that is supposed to prevent the individual from acting with any kind of moral or rational agency. Fear is also premised on the liquidation of civil society; intermediate institutions and plural social structures are destroyed so that despots can act with unmitigated power and violence. I argue that this view does not capture Montesquieu's theory. In my alternative account, fear is intimately connected to our capacity for reason and to our sense of self. It is built on a network of elites, the rule of law, moral education, and the traditional institutions of civil society. I conclude that twentieth-century social science remains too indebted to conventional interpretations of Montesquieu's views, and contemporary theorists would be better served by the alternative analysis proposed here.

ear," wrote Raymond Aron (1968, 20-1), "needs no definition. It is a primal, and so to speak, subpolitical emotion." Many might agree. Living in a liberal democracy, we do not celebrate fear's entrance into the political sphere; it signals a rush of unwelcome emotion. Fear is allowed to lurk at the outer limits of modernity (Bouwsma 1980; Naphy and Roberts 1997) or to stalk the political periphery.1 But in our own midst, fear is supposed to be confined to right-wing militias, apocalyptic religious sects, or some other manifestation of "the paranoid style in American politics" (Hofstadter 1964). We segregate fear by the boundaries of time and space, relegating it to the occasional episode of collective anxiety or to subcultures of eccentric conviction on the far Right and Left. When these boundaries blur, when fear disrupts the quiet hum of institutional politics, we treat it as an emotional upsurge of the untutored and the untamed (Bell 1963; Bennett 1988; Brownstein 1994; Cantril 1940; Davis 1960, 1971; Lipset and Raab 1971).

This view of fear as a denizen haunting civilization is relatively recent. It is rooted in a selective reading—and misreading—of Montesquieu's famous analysis of despotism. Almost since the time that Montesquieu wrote *The Spirit of the Laws*, his followers and critics have interpreted him as arguing that fear is a totalizing emotion that strips individuals of their capacity for reason or any other motivation besides fear. Fearful men and women cannot conceive any particular goals or goods beyond mere survival. They cannot reason about means and ends. They have none of the attributes of selfhood. Fear is an experience unto itself, a wholly primitive passion that can be reduced to the apprehension of raw, unmediated, physical danger (Aron 1968, 20–1; Cohler 1988, 40; Hulliung 1976, 119,

Corey Robin is Assistant Professor of Political Science, Brooklyn College, CUNY, 2900 Bedford Avenue, Brooklyn, NY 11210 (Crobin@brooklyn.cuny.edu).

¹ Three recent analysts, for example, title their study of state terror in Latin America *Fear at the Edge* (Corradi, Fagen, and Garretón 1992).

122; Keohane 1980, 399; Shackleton 1961, 270; Shklar 1987, 83–5). Despotic fear preys upon a society in which the rule of law is weak or nonexistent, political power is monopolized in the hands of a single and arbitrary ruler, there are no secondary or mediating institutions, and what we would now call civil society is entirely absent. Arising out of a sociological void, fear finds its ideal environment atop a flattened plain of atomized particulars (Althusser 1972, 79; Boesche 1990, 743–9; Richter 1973, 9; 1995, 338; Shklar 1987, 85; Venturi 1963, 134–6; Wolin 1989, 102–4, 106, 108–9; Young 1978, 398–9).

I challenge this account of fear, both as it pertains to Montesquieu's own views and as a coherent theory in its own right. The assumptions that fear strips the self of reason and other emotions and that it thrives on sociological and political simplicity can be found in Montesquieu's work, but they obscure an alternative analysis whereby fearful men and women do not conform to the terrorized stereotypes of totalitarian lore. In this alternative account, fearful individuals do not lose all capacity for rational agency. As rational beings, they attempt to maximize their interests, albeit in bad circumstances. They are not fearful because they have been stripped of their humanity but because they desperately cling to it in the face of appalling choices. They are afraid because they fear the loss of some desired good or the frustration of some envisioned end. Selfhood is thus a precondition for fear.

Montesquieu also argues that despotic fear can coexist—and even depend upon—mediating institutions, the rule of law, and a dense civil society. In his most searching and incisive accounts of fear, he dispenses with the now familiar trope of the violent despot laying waste to all social formations beyond his own limited retinue of vizirs and slaves. Instead, Montesquieu envisions fairly complicated political arrangements, including concentric circles of elites, separate spheres, and pluralist institutions, all of which the despot manipulates—rather than destroys—and presses into his service. Despotic fear, in this alternative account, emerges as an intricate political development generated and sustained by diverse social practices.

In the first section of the article, I set out the standard account of Montesquieu's theory of despotic

The author thanks the following individuals for their careful readings of and critical responses to earlier drafts of this article: Bruce Ackerman, Shelley Burtt, Paul Frymer, Greg Grandin, Loulsa Lind, Sankar Muthu, Jim Scott, Rogers Smith, Michelle Stephens, Roy Tsao, Keith Whittington, and Brian Young.

fear. In the second section, I explore an alternative account of that theory, in which fear is shown to be reconcilable with rationality and selfhood, and flourishes within a highly complex and socially stratified civil society. I argue that fear tracks the individual calculations men and women make regarding their own interests, and it rises and falls in response to their evaluations of the costs and benefits of pursuing one course of action over another. At a political level, fear preys upon the relationship between elites and their followers. Far from destroying these social connections, the despot depends upon them as auxiliaries to his own power. In the final two sections, after assessing the legacy of the standard interpretation of Montesquieu's theory of fear, I show how my alternative analysis may better serve us, both theoretically and practically.

THE TRADITIONAL ACCOUNT OF DESPOTIC FEAR

According to most scholars, Montesquieu offers the following account of despotic fear. Fear is a "physiological reaction" of the self to excessive physical force. It is an "involuntary," uncontrollable response to threatening power. Fear is rooted in an immutable physical reality—our physicality as sentient beings and the physicality of what threatens us—which leaves us no choice but to fear those intimidating objects that confront us. Fear is so unalterable precisely because it is so physiological. There is little room for individual agency or judgment in determining what we fear or how we respond to fear. Despotic fear is not mediated by our desires or our values, nor do they influence how we cope with fear. In the face of physical cruelty, men and women can only react in a prescribed, automatonlike fashion. "This is where our physical and moral impulses meet and struggle, and where the former triumph" (Shklar 1987, 84-5). This kind of intensely physical fear usually induces paralysis. Instead of flight, withdrawal, or crafty evasion, the fearful individual stands frozen, mutely surveying the horror that awaits (Althusser 1972, 80–1; Cohler 1988, 71–5; Shackleton 1961, 270).

Fear takes over our entire selves. It is immoderate. It induces a "permanent state of foreboding" (Shklar 1987, 84), which makes it nearly impossible for us to experience any other emotion. The fearful person cannot love, desire, reflect, or imagine. She is incapable of honor or virtue. Fear is "far too imperious" for other feelings, thoughts, or aspirations. Because fear is "so tyrannical a passion" (p. 84), its victims can only experience fear. Among the fearful, then, one will find a dull sameness. Incapable of feeling or doing anything but fear, the fearful do not exhibit differences among themselves. They are not really individuals at all. They lack any vestige of those things—personal idiosyncrasies, tastes, spontaneity, character—that make an individual an individual (Shklar 1987, 84; also see Boesche 1990, 745; Richter 1973, 9; 1977, 47; Todorov 1993, 362–3; Wolin 1989, 108–9; Young 1978, 399).

From these basic characteristics—fear's intensity

and extremity; its physiological dimensions; its unthinking, unreflexive, automatic qualities; its capacity to eliminate all vestiges of rational agency and personality; its antiindividualist tendencies—one can deduce the type of politics that would give rise to it. Because fear is aroused by intense physical force and excessive violence, despotic governments are designed to unleash that force and violence against hapless victims. Concentrated power is crucial. Separated power not only diminishes the amount of power a despot can wield but also helps the despot's victims resist (Cohler 1988, 40; Keohane 1980, 401–2; Richter 1973, 9; Shklar 1987, 85-6). Despotic power must not be constrained by any rule or law. It must be arbitrary because fear is aroused by the sudden, whimsical cruelty of the despot. If the despot's victims were able to adjust their actions to avoid his wrath, they would cultivate those spaces or zones of security that limit fear (Aron 1968, 25; Cohler 1988, 71-5; Keohane 1980, 406; Richter 1995, 338; Young 1978, 401). For the same reason, no moral principle should check the exercise of power. Even concentrated, intense, and cruel power can be made less fearful when it is subject to moral strictures. Thus, despotic power dispenses with all appeals to moral legitimacy. It is founded only on coercion and the fear that coercion arouses (Hulliung 1976, 45; Richter 1977, 47; 1995, 338).

These political sources of despotic fear have a sociological corollary: the absence of organized forms of association within civil society. To maximize its fearsomeness, despotic power seeks to isolate every individual from everyone else. Isolated men and women are powerless. They lack the concerted resources of a community to help them resist despotic power and thereby overcome paralyzing fear (Aron 1968, 25–6; Richter 1973, 9; Young 1978, 402). Despotism destroys nonstate institutions and social classes because their mere existence poses a challenge. In other words, despotism seeks to eliminate not only organized political forms of opposition but also all forms of social cohesion, even when they present no formal challenge to its authority.

Of special concern are the influential classes—in Montesquieu's day, the aristocratic elites whose authority had been curtailed by Louis XIV. Regardless of the views of these elites, regardless of whether they see themselves as adjutants or opponents of centralized power, their mere existence is threatening. Despotic power inevitably aligns itself against the upper classes, leveling society, eliminating textured social formations so that it can apply its power with lethal effect anywhere and everywhere. Sociological complexity and pluralism are thus the inherent enemies of despotism (Althusser 1972, 69-79; Berlin 1980, 155-8; Berman 1970, 10-1; Keohane 1980, 398, 407; Neumann 1957, 111-2; Wolin 1989, 108-9). At its core, despotism thrives on cultural primitivism and social simplicity; the "unplotted conspiracy of differences" gives way to ignorance, barbarism, and homogeneity (Wolin 1989, 107; also see Boesche 1990, 743-9; Hulliung 1975, 39-40; Richter 1973, 9; 1995, 338; Shackleton 1961, 270).

This scholarly account of Montesquieu's theory of despotic fear has been influential for two reasons. First, as I shall explain later, it has been adopted and adapted by many political theorists as a coherent analysis of fear in its own right. Influenced by their own preoccupations with the various tyrannical regimes that have disfigured the twentieth century, many theorists have found in Montesquieu a valued source of reflection and citation. Second, his texts, particularly *The Spirit of the Laws*, provide much evidence for such interpretations.

Montesquieu formulated his theory of despotic fear with the avowed polemical purpose of rousing elite opinion in France against creeping royal absolutism. If he could depict a form of fear so absolute that it destroyed all that was good and valued, then he might establish an indisputable moral rationale against those features of French rule that smacked of despotism: political centralization, arbitrary power, and the destruction of traditional privileges. Montesquieu's account was thus meant as a contribution to a tradition of constitutional rhetoric, a rhetoric of defense-sometimes aristocratic, sometimes liberal-against encroaching royal power (Aron 1968, 26; Keohane 1980, 403, 407; Koebner 1951, 293-302; Neumann 1957, 111-2; Ranum 1969, 609-12, 617-22; Richter 1973, 7-9; 1977, 31-2, 45-6; 1995, 334-7; Shackleton 1961, 15-7, 202, 226-8; 1988, 239; Shklar 1987, 2-5, 18-9, 69, 74-5, 79-81, 85; Venturi 1963, 134-6; Young 1978, 404-5; for a contrary view, see Hulliung 1976).

This conviction was reflected in Montesquieu's writing and activity throughout his adult life. It did not flag with time, and it found its fullest expression in The Spirit of the Laws (Shklar 1987, 67-9). But there was a cost to his boldness: In Montesquieu's late masterpiece, polemic occasionally managed to eclipse analysis. In his desire to launch a full-scale broadside against French absolutism, Montesquieu sometimes lost sight of his more subtle and often more piercing insights about despotism. He overstated his case about fear's self-sustaining and all-encompassing dimensions, a failing instantly noted by his critics. Inspired by his own and equally polemical support for enlightened absolutism, Voltaire remarked that Montesquieu "satirizes more than he judges." He "makes us wish that so noble a mind had tried to instruct rather than shock" (Voltaire [1764] 1962, 508). Montesquieu's most dramatic account of despotic fear did not reflect Montesquieu at his most searching or probing but, rather, the liberal imagination at its most politically engaged and morally aroused. It is no accident, then, that scholars have seized on this portrait of despotic fear in The Spirit of the Laws. It has a tremendous rhetorical force, but a force that can obscure as much as it reveals.

MONTESQUIEU'S ALTERNATIVE ANALYSIS OF DESPOTIC FEAR

I challenge this traditional account of Montesquieu's theory through a close reading of his *The Persian Letters*, published more than twenty-five years before *The Spirit of the Laws*. Among Montesquieu scholars there is an overwhelming consensus that the earlier

work prefigures the later, particularly in its analysis of despotic fear (Boesche 1990, 742; Hulliung 1976, 138; Kra 1963, 11; Neumann 1957, 102; Richter 1973, 9; 1977, 45; Shackleton 1961, 45; Shklar 1987, 67; Todorov 1993, 353). To some degree, that consensus is justified. As I have suggested, Montesquieu had a lifelong concern about the effects of despotic fear. The Spirit of the Laws was a more mature, more radical, more comprehensive indictment of a phenomenon he had been decrying since the beginning of his writing life. The same intention—to construct a portrait of despotism in the East in order to cut short its career in the West—animated both The Persian Letters and The Spirit of the Laws.

If one reads the earlier work carefully, however, one can piece together a different account of despotic fear from that discussed in the previous section. In The Persian Letters, we discover a fear that works most effectively when it is wielded by multiple political actors and elites, each inspired by different considerations and motivations and even conflicting interests. We find a regime structured on a comprehensive system of moral education, rational calculations of self-interest, overweening personal ambition, and fairly traditional ideas of virtue, duty, law, and morality. The victims of despotic fear are not incapable of familial love and affection. In fact, affection and mutual commitment finance the transactions of the despotic economy. In depicting these various elements of despotism, Montesquieu manages to capture in brilliant detail the intricate social universe of the Versailles court, with all its hierarchy and flattery, its conniving ambition, and its penchant for absolute submission.

To be sure, the distinctions between the two works should not be overstated. Similar evidence can also be found in The Spirit of the Laws. For instance, in the later work, Montesquieu occasionally suggests that despotic fear does not entirely destroy rational calculations and all forms of reason. The victims of despotism, after all, can build houses that last at least a lifetime (Montesquieu [1748] 1988, V.14.61). They are savvy enough to keep silent in the presence of the despot (V.14.60). What Montesquieu seems to be pointing to here is a limited kind of rationality that undergirds despotism. Responding to short-term needs, the victims of despotism act rationally by adjusting their actions to secure the immediate goal of survival. But their quick-fix mentality leads them to reproduce the conditions that keep them in perpetual thrall. They cannot see how their actions, designed to respond to short-term needs, undercut their long-term interests: "When the savages of Louisiana want fruit, they cut down the tree and gather the fruit. There you have despotic government" (V.13.59). Silence may buy protection in the short term, but it sustains the despot's power, which threatens survival over the long term. The victims of fear are not without reason. They merely cannot escape the conundrums of a limited instrumental rationality.

These bits of evidence can be found in *The Spirit of the Laws*, but they are often eclipsed by more dramatic portraits of total terror. Fear is held to be so omnipres-

ent in despotism that "there is neither honor nor virtue" (V.17.67). "How could honor endure the despot" (III.8.27)? Fear makes it impossible for individuals to experience other sensations or thoughts beside fear. The fearful cannot love, desire, or hope. One cannot appeal to their sense of loyalty or their commitments to others because "it is useless to counter with natural feelings, respect for a father, tenderness for one's children and women, laws of honor, or the state of one's health" (III.10.29). Fear strips a person of all worldliness. To instill fear in someone, "one must take everything away" (IV.3.35). "In despotic countries one is so unhappy that one fears death more than one cherishes life" (VI.9.82). A person's fear of death, in other words, has little or nothing to do with the things that make life worth living. Fear has been disconnected from those ends or purposes that make one's life one's own. Fear no longer stands in any proximity to the constituent elements of the self. It annihilates the self. To understand fear—both at the individual level and in a larger society—we need not understand the familiar passions of human nature or the normal rules of politics but, rather, what happens when those rules and passions disappear. In describing Montesquieu's theory of fear, scholars have resorted to such phrases as "void," "desert," "subpolitical," the "social equivalent of death" (Althusser 1972, 79; Aron 1968, 21; Shklar 1987, 85) metaphors that reflect, almost unselfconsciously, a certain tendency in Montesquieu's own thinking about fear. Montesquieu himself uses the word "monstrous" to describe despotic regimes (III.9.28), an allusion both to the cruelty of despotism and to the notion that fear belongs to a world entirely different from our own.

In The Persian Letters there is a more discerning and subtle account of despotic fear, an account that allows for a fuller range of emotions, sympathies, and distributions of power than Montesquieu's later account suggests. One reason for this distinction between the two works may be attributed, as I have argued to Montesquieu's increasing confidence and radicalism in his mature indictment of royal absolutism. Less constrained in his vision and imagination, Montesquieu was able to give voice in The Spirit of the Laws to his most blistering antipathies and far-reaching aspirations. But as those antipathies came into their own. they assumed a more aggressive, and occasionally more tendentious, shape. We must turn to the earlier work if we are to discover a less polemical and more discerning account of fear.

The Persian Letters is the story of Usbek and Rhedi, two Persian gentlemen who leave their homes and families to travel to France in search of knowledge. In their travels, they encounter many novel ideas and practices, and in a series of letters they recount these pieces of exotica to each other and to their Persian friends. Usbek has a harem of wives and eunuchs back in Persia, and a chief subtext of the novel is the parallel between his tyranny at home and the tyranny he finds abroad. The harem is not a full-blown regime of the sort that Montesquieu describes in The Spirit of the Laws, but it offers a portrait in miniature of the

micropolitics of despotism. Through the literary conceit of the harem, Montesquieu provides a concrete and vivid account of the underlying structures and passions of despotic fear.

Despot

The first challenge that *The Persian Letters* poses to our standard interpretations of despotic fear concerns the figure of the despot himself. For many scholars, the despot is a simple creature of desire with a solipsistic temperament and an insatiable thirst for violence or instant gratification (Althusser 1972, 82; Behdad 1989; Boesche 1990, 749; Cohler 1988, 71–2; Shklar 1987, 83–5). In *The Spirit of the Laws*, Montesquieu provides much evidence for such interpretations. The despot rules, he writes, "without law" because restrictions of any sort would prevent him from fulfilling his whims and from acting capriciously and arbitrarily (II.1.10).

Usbek, however, is a gentleman and a scholar. He is by turns an intellectual seeking wisdom and truth, a charming husband surrounded by loving wives, a faithful friend, and a teacher admired and respected by his students. He also happens to be a purveyor of fear. One moment he is speculating about the foundations of international law, the next he is ordering his servants to terrorize his wives. He aspires to a pluralist vision of the universe, claiming that no one set of principles is objectively superior to another, but at the same time he forces his wives to accept a regime of moral purity. He speaks with the measured tones of a moderate skeptic but acts with the conviction of a fanatic. He is a humanitarian and a rapist, a rationalist and a terrorist.

In explaining his decision to leave Persia, Usbek writes: "Rica and I are perhaps the first among the Persians who have been moved by a desire for knowledge to leave their country and to give up the savors of a peaceful life that they might go seek wisdom the hard way" (Montesquieu [1721] 1961, letter 1, 47). Usbek is an intellectual. He seeks wisdom, and he willingly disrupts the routines and comforts of his life to get it. He is committed to the strenuous search for truth, not the easy contemplation of ideals. He is convinced that one finds truth only by transcending the limits of one's own parochial world. "We were born in a flourishing kingdom," he says about himself and Rica, "but we did not believe that its borders should be those of our knowledge nor that Oriental insight alone should enlighten us" (letter 1, 47). He is a prototypical representative of one strand of the Enlightenment not a Condorcet or Helvetius (i.e., a rationalist who submits to the severities of reason) but a chastened skeptic, aware of the world's multiplicities and diversities and impatient with monistic models of the truth (Shklar 1987, 26-7, 30).

Usbek is also a moralist. Like all moralists, he finds his virtue tested by the demands of politics. He explains that early in his life he took part in the affairs of state and struggled valiantly to hold onto his principles. He sought to expose lies, counter flattery and vice, and speak truth to power. At the royal court, he "spoke there a hitherto unknown language" (letter 8, 54) but

gained more enemies than converts. Like so many moralists who founder on the rocks of compromise and expedience, Usbek beat a hasty retreat from politics. He retired to a country home, turned to his books, and set up shop as a gentleman scholar (letter 8, 54). He does not, however, live in isolation. He retains a circle of friends and colleagues, learned men who argue about politics and morality. He is the presiding eminence of this circle, respected for his rare wisdom. He teaches a modified Aristotelianism, arguing that men are by nature virtuous, that they find their utmost happiness in leading a virtuous life (letter 10, 58). Despite his exemplary virtue, Usbek is ill at ease in the world of religion. He is too much a doubter, too much a skeptic, to be a believer. His religious commitments are challenged by a scientific bent and a quasi-Lockean epistemology.

Usbek stands for everything that, according to received wisdom, is opposed to despotic practice. He is wise, learned, lawful, and moral. Moreover, he is not dogmatic. He displays an openness, a willingness to engage with the strange and new, and he has a facility for understanding and penetrating beneath the surface. He delights in the diversity of modern life, and he scorns Rhedi's primitivism and obsession with Spartan virtue. In a fascinating exchange of letters, Usbek and Rhedi anticipate the debate Rousseau would later inspire with his First Discourse. Rhedi tells Usbek that progress and civilization have meant only that science has produced more deadly forms of warfare and that artistic excellence has corrupted popular morals. A return to Spartan virtue would serve society better than would continuing cultural progress. Usbek issues a powerful rejoinder on behalf of the Enlightenment: "Have you ever reflected upon the unhappy and savage condition into which the loss of the arts would drag us?" Instead of bemoaning scientific progress, says Usbek, Rhedi should be advocating international arms control and treaties. Gunpowder and modern weaponry have made military battles "much less bloody than they were before, because there is practically no direct engagement now." He challenges Rhedi's association of cultural simplicity with physical fortitude. The Greeks, after all, "conquered and subjugated [the Persians] so many times" but nonetheless "cultivated the arts with infinitely more care than [the Persians]." Usbek praises dynamic, open societies, in which commerce and culture promote a more humane existence. He condemns Persian slavery because it promotes "an eternal lethargy." Against this crippling society, he envisions a society of "abundance and industry" (letter 17, 68-9; letters 105-6, 195-9; letter 115, 210-2).

Despite his openness and embrace of cultural diversity and pluralism, Usbek is very much a despot. He castrates men so that they will serve him more faithfully. At the slightest sign of disobedience or challenge from his wives, he orders the eunuchs to punish them harshly. He will not tolerate disagreement, and he does everything he can to ensure that his universe is ordered in accordance with his principles. How is it possible that this learned, skeptical individual could preside over such a regime of fear?

Usbek's capacity for compartmentalizing his life into separate spheres—the brilliant intellectual, the political moralist, the vicious husband—is one key to his despotism. He does not demand the absolute reconciliation of opposing principles. Unlike the stereotypical rationalists of the Enlightenment, Usbek tolerates contradictions and accepts the inherent plurality of disparate worlds. But it is precisely this genial tolerance of other cultures that facilitates his exercise of violence at home and his speculation about peace abroad. He can dominate his wives and advocate tolerance because the harem demands a different cultural logic than does the Persian court. In other words, it is precisely his ideas about cultural pluralism that enable him to rise above mere hypocrisy or self-delusion, which is how some scholars have interpreted his behavior (Hulliung 1976, 123; Shklar 1987, 31, 34; Todorov 1993, 355-6). He can be both intellectual and despot because he divides the world into distinct spheres with particular rules and practices. He tolerates ambiguity and incoherence, the very values that Montesquieu and his adherents claim are antithetical to despotism (Berlin 1980; Shklar 1987; 1989; Wolin 1989).

Montesquieu's followers often argue that despotisms thrive in the absence of the rule of law and that they dispense with the need for moral justifications. Law and morality only hamper the workings of absolute power. Montesquieu makes just these claims in The Spirit of the Laws (II.1.10; II.4-5.17-20; III.8-10.26-30; V.10-16.56-66). What is most striking about the harem, however, is its obsession with morality and lawfulness. The harem is nothing but rules and endless homilies about upholding the rules. In the set of instructions that Usbek leaves to his chief eunuch, he claims that the eunuch must preside over a strenuous moral regime based on law. "Your tireless attentions uphold virtue when it vacillates." The eunuch is the "scourge of evil and the pillar of fidelity." He is charged with ensuring that the wives "carry out the laws of the harem." Not only is he responsible for maintaining strict, clear laws, but also he must use his power to uphold them. "You command as a master like myself," Usbek tells the eunuch, "whenever you fear a weakening of the laws of decency and modesty" (letter 2, 47-8). Far from promoting arbitrary violence, Usbek ordains strict rules and conditions for the exercise of violence. Punishments are severe, to be sure, but they are meted out under precise circumstances and with exquisite care. The eunuch must use his power only in response to a specific transgression. He is not to act out of whimsy or passion.

At one point during his travels, Usbek finds out that Zachi, one of his most beloved wives, has allowed a white eunuch into her room, which is one of the cardinal crimes of the harem. Black eunuchs are allowed to enter the rooms of the wives, but white eunuchs are not.² When Usbek hears of Zachi's transgression, he immediately writes her: "You have of-

² Although black sexuality will later come to symbolize a particularly potent threat in Western racial imagery, in Montesquieu's account, blacks are not as sexually menacing as whites.

fended me, Zachi, and I feel in my heart emotions that should cause you to tremble if my remoteness did not allow you the time to change your conduct and calm the violent jealousy that torments me (letter 20, 72). He asks: "How can you have forgotten yourself to the point of not realizing that you are not permitted to receive a white eunuch in your room when you have black ones provided to attend on you?" Were she to argue that the white eunuchs were not real men and therefore could not excite her, he would not be convinced, because her actions violate both "the laws of the seraglio" and his "honor." Should she respond that she has never broken previous rules, he would not be impressed. Guarded by the eunuchs twenty-four hours a day, she never had the chance not to be virtuous. She has affected "a virtue that is not free" (letter 20, 73).

As an instrument of fear, this letter is a revealing document. It shows that although Usbek is impassioned and angry, he does not lose his capacity for reason. If anything, the letter is a triumph of Thomistic logic, formulating postulates, posing questions, offering answers. With its prosecutorial back-and-forth, Usbek's letter suggests a despot quite different from our conventional accounts of the voluptuous, pleasureseeking prince. At various points in the letter, Usbek shows calculated restraint, indicating that he is willing to give Zachi another chance. He holds out the threat of punishment and the possibility for mercy as a means of making her frightened enough to do what he wants but hopeful enough not to forsake the regime. If Zachi were to decide that Usbek would kill her no matter what she did, then she might conclude that open revolt was a more reasonable path to her own preservation.

Usbek also attempts to create fear in Zachi through a denunciatory moralism. He repeatedly comes back to Zachi's betrayal of him, her flouting of the law, her false virtue. These expressions of moral outrage and invocations of the law are not hypocritical or selfserving. They convey Usbek's sincere conviction that Zachi has transgressed against an entire moral order that will now come crashing down upon her. He claims that her fellow wives view the harem as "a happy shelter against the attacks of vice, a sacred temple where your sex loses its weakness and becomes invincible despite all the disadvantages of its nature" (letter 20, 73). The harem is an oasis of morality and purity that has protected Zachi and her friends. She is thus implicated in the comforts of this order. She should value its protections and the safety it provides against far more dangerous predators. By challenging it, she not only has threatened Usbek and morality in general but also has betrayed herself, threatening the things most dear to her. Usbek writes:

What would you do if, left to yourself, you had for sole defense your love for me (which you have so grievously offended) and your duty (which you have so shamelessly betrayed)? How holy are the customs of the country where you live that you should be snatched from the attacks of the lowest slaves! You ought to thank me for the discomfort in which I make you live, for it is only because of it that you deserve to go on living (letter 20, 73–4).

Usbek appeals to Zachi's guilty conscience, which suggests that, at least for the despot, invoking moral strictures and moral values can work hand in hand with fear. Morality only serves as a tool of discipline to the extent that all parties in the despotism believe in it. That is why Usbek invokes it so often.

Enforcer

One obstacle Montesquieu faces in explaining regimes of terror is how to account for the fact that a single individual is able to terrorize so many. If these other individuals were to join together, they would have far more collective power at their disposal and could easily defeat the despot. The despot, like all agents of domination, must have allies and arms. Montesquieu's solution in The Spirit of the Laws is the "vizir." The despot seeks to fulfill his desires, but to ensure that his power is maintained while he is gratifying himself, he entrusts the means of violence to the vizir. The vizir works with a small circle of subvizirs, each of whom is dedicated to maintaining fear throughout the regime. It is not clear why these vizirs are afraid of the despot. Montesquieu suggests that they are psychologically impoverished characters. They are weak and culturally primitive, which might explain their subjugation to the despot even though they control more weaponry and command more physical force than he does. At a minimum, they cannot have either courage or ambition (the hallmarks of true monarchies), for that might induce them to subvert his authority.

The prince's immense power passes intact to those to whom he entrusts it. People capable of much self-esteem would be in a position to cause revolutions. Therefore, fear must beat down everyone's courage and extinguish even the slightest feeling of ambition (Montesquieu [1742] 1988, III.9.28).

And many scholars of Montesquieu have reiterated this claim (Althusser 1972, 70-4; Cohler 1988, 40, 71-2; Hulliung 1976, 39-40; Keohane 1980, 411).

The harem provides a fascinating counterpoint to these received views. Usbek relies upon his own vizirs, the eunuchs, to control his wives. But since he has entrusted them with total power over his wives, he must ensure that they remain afraid of him. Usbek must never allow the eunuchs to discover their own power, and he must never provide them enough incentives to attempt to overcome their fear. Contrary to those who claim that the only way Usbek can keep the eunuchs in check is to exercise force against them (Cohler 1988, 72), Montesquieu reveals two key weapons: first, the authority of the older, more senior eunuchs; second, the ambition of the younger eunuchs. By carefully manipulating a hierarchical world of advancement and promotion, Usbek is able to keep the eunuchs in line.

These paired realities—the mentorship of the senior eunuchs and the ambition of the younger eunuchs—suggest that despotic terror does not arise outside the normal structure of a society but instead depends upon it. It is precisely the connections among people, particularly those connections premised upon unequal power

and resources, that undergird fear. The older eunuchs have authority over the younger because of their experience and power, and the younger are willing to collaborate with the older ones because they see in their seniors a means of advancing their own interests and ambitions.

One of Usbek's senior eunuchs confesses that his life has entailed nothing but unmitigated fear. "I sigh, overwhelmed as I am by the weight of fifty years of cares and anxieties. In the course of a long life I can say that I have had not one peaceful day nor any tranquil moment" (letter 9, 55). The eunuch appears to embody the traditional understanding of despotic fear. He lives in a state of constant anxiety and insecurity, never sure what might happen to him, always dreading the worst. His personal history, however, discloses a different face of fear. When he was a young slave, he was asked by Usbek to become a eunuch so that he could assume responsibility over the harem wives. In taking the job, the eunuch made several calculations. First, Usbek threatened him, claiming that he would face severe punishment if he did not agree to be castrated. Second, he was tired of being a slave. The work was difficult and wearying, and he wanted a change. Third, he was ambitious and hoped to work his way up to a higher position. "I planned," he says, "to sacrifice my passions to tranquility and fortune" (letter 9, 55).

The desire for a promotion undergirded the eunuch's fear in several ways. It enabled him to accommodate his fear, to accede to its dictates because he believed he might gain something by doing so. But it also exacerbated his fear by suggesting to him not only that he would face unbearable pain and suffering if he resisted but also that he might miss out on a promising opportunity. We do not know what he would have decided had he been content with his own position. Perhaps the threats would have been enough. Yet, the mere fact that Usbek felt compelled to tempt him with possibilities, to remind him of how miserable his situation was, suggests that threats alone cannot create fear. Some additional desire is necessary to sustain fear. The promise of advancement made the capitulation to fear a sensible proposition. In fact, the eunuch admits that when he decided to be castrated he could "see the recompense but not the loss" (letter 9, 55). Utility maximization is thus crucial to the structure of fear among the eunuchs (see also letter 64, 134-7; appendix 2, 285-8). Fear takes hold of the individual not by destroying his aspirations but by stoking and manipulating them. It thrives on the highly idiosyncratic ambitions of each person.

The pursuit of ambition, however, is not an idea that occurs naturally among the slaves and eunuchs. They must learn it. Education thus turns out to be a central institution in despotism, but it is neither the education described by Montesquieu scholars (Richter 1973, 9) nor the despotic education described by Montesquieu in *The Spirit of the Laws*: "Education" in a despotism "is, in a way, null there." Because "education must bring about servility," the despot should only teach "the spirit of a few very simple religious principles." Genuine "knowledge will be dangerous" (IV.3.34-5).

In The Persian Letters, education does not make the eunuchs ignorant or downtrodden. It stokes their ambition and encourages them to think about the promise of power and status. It prescribes self-mutilation as a smart career move. One slave, Pharan, tries to resist castration. Like many of the younger men, he does not want to give up his "humanity"-no matter how tempting the career prospects (letter 42, 101). His mentors attempt to teach him otherwise. The first black eunuch writes to Usbek that he is attempting to persuade Pharan to "allow himself to be consecrated to that office" because the eunuch believes it would "be to [Pharan's] advantage" (letter 41, 100). The senior eunuchs teach their pupils that it is irrational to resist castration because they will reap untold benefits if they join the harem's managerial rank.

The senior eunuchs also assuage and soften the younger eunuchs' violent emotional reactions, which get in the way of rational calculation. When the younger eunuchs feel sadness or anger, the older ones soothe them. The first eunuch writes to Jaron, one of the younger black eunuchs, that he saw Jaron's "childhood advance with pleasure." The older eunuch was Jaron's mentor, advising him and helping him navigate the dangerous shoals of the harem. When the time came for "the blade" to separate "forever" Jaron from his "nature," the older eunuch was on hand both to soothe and to cut. "I quieted your tears and your outcries." He loved Jaron as a father loves a son. By playing this ostensibly humanitarian role, he inducted him into the despotic regime. Tenderness was used to temper Jaron's anger and sadness, making his life more normal and bearable and making him less of a threat to the regime. Kindness sustained fear by calming emotion and enabling the younger eunuchs to remember what they gain by castration. "I thought of you," the first eunuch writes to Jaron, "as having a second birth and taking leave of a servitude in which you always had to obey, to enter another kind of servitude, where you were to command" (letter 15, 67).

By reminding the eunuchs of what their capitulation to fear has earned them, and by tranquilizing their anger and resentment, these older eunuchs reveal the extent to which fear depends upon concentric circles of elites spread throughout society. Without the older eunuchs. Usbek could not wield power because he could not attend to all the unhappiness that his regime creates. The older eunuchs play a pacifying role for a variety of reasons. They have a genuine love and affection for their younger brethren. They hope to cushion their pain and diminish their anguish. They also have their own self-interest at stake. They have attained positions of power, status, and responsibility. Should the younger eunuchs get too angry or grow disruptive, the older ones might lose control of the harem—and the power and prestige that go with that control. Despotic fear is thus sustained by the eunuchs, who act in part for reasons that have little to do with their fear of Usbek. In many interpretations of despotic fear, victims and victimizers share the same motivation-a simple fear of violence-and they act for no other reason than that fear (Todorov 1993, 362). In this case, however, not only are the eunuchs capable of diverse motivations—including their own self-interest, a genuine compassion for the younger eunuchs, and a pride in their work—but also it is precisely the range and extent of their motivations that enable the despotism to survive.

Victim

After Usbek and the eunuchs, there are the wives. If anyone should display the characteristics scholars often attribute to fear—paralyzed will, crippled rationality, total loss of self—it should be the harem women. In fact, the wives maintain a high degree of independence and selfhood, and they also have their own particular concerns and motivations, which serve as props to the harem's stability and survival. The wives launch tiny rebellions and commit small acts of disobedience. One eunuch discovers that a wife, Zephis, has had an affair with a slave girl, Zelid. When she is found out, Zephis craftily drafts a letter to Usbek, protesting her innocence and appealing to his mercy. She paints herself as the unwitting victim of the eunuch's jealously and nastiness, thereby undermining his reputation in the eyes of Usbek and advancing her own (letter 4, 50). Other wives also have affairs and strategically break the rules of the harem, taking every opportunity to fulfill their own desires. Far from beaten down, they are resourceful and strategic about their cooperation and submission. This is not to say they are not frightened. They are frightened enough to avoid overt challenge to Usbek's authority. But short of that, they do what they can to construct a life for themselves.

One resource at their disposal is their ability to make the lives of the eunuchs miserable. They make incessant demands and send the eunuchs scurrying at all hours of the night for some desired pleasure. The wives use this power strategically. In return for not harassing the eunuchs, they receive special privileges (letter 9, 55-8). They also use Usbek's sexual desire as a weapon for their own advancement. If the eunuchs too zealously pursue the wives' transgressions, the women tempt Usbek to bed and, at the moment of his greatest pleasure, extract his promise to punish the eunuchs. One eunuch observes: "I have everything to fear from their tears, from their sighs, from their embraces, from their very pleasure. . . . Their charms can become terrible for me." His fear rests upon these rational transactions between Usbek and the wives—a pardon in exchange for pleasure—and he laments that the wives' "present services" to Usbek "wipe out in one moment all my services of the past." The eunuch concludes that his own fear is heightened by the "amorous negotiation" of the wives and their ability to craft a "treaty made with sighs" (letter 9, 57-8). With all their overtones of bargaining, exchange, and contract, these metaphors suggest that despotic terror rests more on a certain kind of economy of fear-discrete interests and goals are fulfilled through a trade of services—than on the total loss of self that we encounter in much of the secondary literature.

Even when the wives seem the most degraded, the

most stripped of their humanity, they reveal a desire for self-promotion that calls into question some of the rhetoric found in The Spirit of the Laws and among many Montesquieu scholars. Zachi reminds Usbek of a beauty contest he once conducted among his wives. Each was forced to strip in front of him, decorating her body with makeup, jewelry, and exotic accessories. Usbek examined each of them meticulously. His "curious regard" was "extended" to their "most secret spots." He had them "assume a thousand different positions—ever a new command and ever a new submission." In the history of political philosophy, it would be difficult to find a more painfully exacting portrait of personal degradation. The beauty contest seems the perfect metaphor for the stripping down of self that has come to be emblematic of despotism. Nonetheless, Zachi confesses that at this moment of submission, she longed for victory, for that would bring her greater status in the harem. If anointed the most beautiful, she would become the "mistress of [Usbek's] heart." Not unlike the eunuchs, she accepts domination in order to stand above others. She was not weighed down by the strain of total humiliation. Instead, she envisioned a trajectory of personal advancement (letter

Although self-serving, Zachi's ambition—and that of the other wives—has a cost: It keeps Usbek in power. These ambitions for success can only be satisfied if Usbek remains at the top of the hierarchy and then chooses one of the wives as his favorite. Being afraid, being submissive, and keeping an eye on one's personal prospects thus fit together perfectly. Their congruence reveals how fear is structured by and reinforces a limited, short-term rationality, one more focused on personal advancement than collective emancipation.

As in the case of the eunuchs, however, the wives do not automatically subscribe to this short-term rationality. They, too, must develop an elaborate network of authority among themselves in order to teach the younger wives the harem rules. Zelis, for example, writes Usbek that she has decided to enroll her daughter into the harem at the early age of seven. She does not want to wait until the child is ten, the standard age of introduction. Allowing her to run freely for a few more years would only make the girl love the freedom of youth rather than cherish the "holy education within the sacred walls." Thrust into the harem at the usual age, the girl might experience its strictures as a kind of violence. Zelis wishes to coax rather than plunge her daughter into the harem's treacherous seas. Zelis believes in Aristotelian education. The girl should learn slowly the practice of docility so that submission will acquire the "gentle effect of habit." Submission is not natural. It must be learned, and rebelliousness must be unlearned: "In vain do they talk to us of the subordinate position in which Nature has placed us. It is not enough to make us feel that. We must practice our role of subordinate so that it may hold us firm through the critical period when passions begin to appear and encourage us toward independence" (letter 62, 132-3).

We have come to think that familial love does not survive despotic fear, but it does. In fact, it can even sustain fear. Zelis is inspired by a deep love for her daughter. Her desire for her daughter's happiness and well-being leads her to try to indoctrinate the child so thoroughly that she will never challenge Usbek; she will come to accept a regime of fear not as an alien imposition but as part of the manners and mores of her culture. In this case, fear does not depend on violence or vicious acts of cruelty. It is stoked by the love of a mother for her child and by the mother's education of her child. The very humanness of this connection helps reproduce the despotic order. Far from proving that despotism relies upon an entirely different universe of feeling and desire, *The Persian Letters* shows how ordinary emotions—even love and compassion—can bolster the most terrible regimes of fear.

Contrary to some of the more partisan claims in *The Spirit of the Laws*, and contrary to the almost universal consensus among Montesquieu scholars, *The Persian Letters* gives the following account of despotic fear. First, fear is not antithetical to reason. It thrives on an instrumental, cost-benefit analysis, whereby the victims and purveyors of fear calculate what is lost and gained from defying or cooperating with threatening power. Fear does not just coexist with this kind of rationality. It is structured by this rationality. The eunuchs, for example, fear that if they do not accept castration they will miss a promising opportunity. Rationality lends a kind of moral legitimacy to capitulating to fear. Acting out of fear seems less dishonorable when it promises to secure a desired good.

As the calculations of both the wives and eunuchs demonstrate, however, this rationality is limited. It prevents men and women from achieving their longterm, higher-order interests. No one would claim that either the eunuchs or wives are well served by the despotic apparatus they help sustain. Moreover, given that Usbek is absent from home for a good part of the novel, the cooperation of the eunuchs and wives seems particularly irrational. They could easily decide as a group-without any threat from Usbek-that fulfilling their master's commands is not in their interests and that liberation is. But that would require them to see beyond the immediate goods they receive from cooperating, that is, the goods of survival, power, promotion, and position. Their fearful reasoning, then, follows a kind of truncated rationality. Fear is not opposed to rationality; it merely rests upon an incomplete rationality.

Second, implicit in this first point is that fear is intimately connected to the broad range of sympathies, desires, and aspirations that motivate ordinary men and women. The fearful do not lack virtue, honor, ambition, love, loyalty, or any of the other characteristics that make us human. They are fearful precisely because they are human, because they do have ambitions and loyalties, because they do love and have some semblance of honor. Zelis's attempts to indoctrinate her daughter so that she will not suffer from a violent induction into the harem is inspired by a perfectly honorable and virtuous parental impulse—to protect her child from harm. The outsider, of course, can see what the consequences are. But from Zelis's perspec-

tive, her attempts are neither craven nor disreputable. They come from a deep reserve of familial connection. One might even say that, given the options, Zelis has made a humanitarian gesture, albeit one with devastating consequences.

Third, fear is not aroused solely by the cruelty or excessive violence of the despot. Kindness and wellmeaning compassion, in fact, can be fear's most terrible adjutants. In Zelis's case, we see that fear will be generated in the child by a mother who has all the best intentions in the world. Like all good parents, Zelis will probably attempt to transmit hard-won lessons of life to her daughter, and these lessons will be framed as coping methods for the little girl to advance herself in the world. The senior eunuchs are likewise inspired, in part, by a desire for their younger colleagues to avoid some of the pain and suffering they themselves experienced. These small acts of kindness, however, only deliver everyone into Usbek's grip. The terrible irony of Montesquieu's novel is that, pace contemporary followers of Montesquieu (Shklar 1984, 1987, 1989), fear does not depend on cruelty. Fear is not solely the product of violence or actions explicitly designed to inspire fear. It just as easily follows from a humanitarian concern to lessen the suffering of one's own.

Fourth, despotic power need not be arbitrary, concentrated, and centralized, and it need not be unregulated by the rule of law or moral strictures. Usbek is cruel. His punishments can be excessive. But they do not just fall upon anyone. They are targeted at those who transgress against the harem. In that regard at least, despotic power is fairly predictable. The eunuchs understand that they can only inflict pain on those who have broken the rules. Individuals who obey the rules avoid punishment. Likewise, Usbek neither monopolizes all power nor delegates it to a small coterie of vizirs. As we have seen, each member of the harem has some kind of power, some resource to deploy against the blandishments of those above them. The wives can manipulate Usbek and the eunuchs. The eunuchs have some power as well against the wives. More important, among the eunuchs and among the wives, there are forms of power and authority that go beyond Usbek's control. The senior eunuchs rule over the junior eunuchs; the wives rule over their daughters. This sharing of power does not diminish the generation and transmission of despotic power. If anything, it is usually used to exacerbate it.

Furthermore, the power that Usbek and the eunuchs do exercise is not entirely freed of moral categories of legitimacy. Usbek, the eunuchs, and even the wives work hard at propagating the virtues of the harem. Power is supposed to be exercised against vice and on behalf of virtue. It is a virtue that we might view as impoverished and debilitating, as false and ultimately destructive of liberal values, but that does not mean power is wielded without any appeal to values and to ethical purposes. What is more, those values and purposes are often framed as principles designed to benefit not just one individual—Usbek—but everyone. All members of the harem partake of their own

particular virtue, and the power that is exercised is designed to enable all to fulfill their particular virtue.

Finally, the social universe underlying despotic power has all the characteristics of pluralist spheres, separated institutions, multiple associations, and hierarchical elites that we have come to think of as checks against despotic fear. The harem is not a simple arrangement of power whereby a violent individual strides across a wasteland, the flash of his sword illuminating the absence of opposition and social cohesion. Usbek's power rests atop many different kinds of relationships and hierarchies. There is the relationship between Usbek and the senior eunuchs, who in turn have a relationship with their junior eunuchs. The women stand beneath the eunuchs, and among the women there is also the latent hierarchy among the wives and between mothers and daughters. In one regard, then, the harem resembles nothing so much as the pyramidal structure of feudalism, with reciprocal obligations and duties arranged vertically. But the harem is even more complicated: The wives are also in some measure senior to the eunuchs, able to negotiate power and resources through their direct contact with Usbek. The world of the harem, in short, is one in which the avenues of social influence are as crooked and entangled as the streets of eighteenth-century Paris. It is not just that despotic power can thrive amid enormously confusing and complicated social arrangements. Despotic power is transacted entirely through those arrangements, which makes fear the product not of sociological simplicity but of pluralist density and sociological complexity.

THE THEORY IN PRACTICE

For the better part of three centuries, this alternative account of fear is not the one that has captured the attention of Montesquieu's readers. Instead, they have focused on two points: Fear is all-consuming and destructive of selfhood, and it thrives in the absence of civil society and countervailing powers. One reason for this preoccupation has to do with the rhetorical power of Montesquieu himself: The bracing qualities of his vision in The Spirit of the Laws are undeniable. Another reason has to do with his readers. Since the eighteenth century, the traditional account of despotic fear has been used as a political weapon, first by Enlightenment polemicists against the European state, then by social theorists such as Tocqueville against majoritarian democracy, and finally by twentieth-century opponents of totalitarianism (Arendt 1951; Friedrich 1954; Friedrich and Brzezinski 1965; Getty and Manning 1993, 1-18; Tocqueville [1835, 1840] 1969). Because despotic fear has played such a central role in modern political struggles, intellectuals of all stripes have tended to overstate its totalizing dimensions. In the specter of a despotism so horrifying that it destroys all semblance of civilization, theorists and intellectuals have found much ballast for their arguments. There can be no doubt that the shocking imagery of despotic fear has served a useful function. It has rallied men and women of humane sympathy to oppose tyrannies around the

world. But this imagery has a price: It has left us with caricature rather than insight.

When the theory of despotic fear first appeared, intellectuals decried its dehumanizing stereotypes. The most formidable challenge came from Abraham-Hyacinthe Anquetil-Duperron, who argued that the theory of "Oriental despotism" grew out of inaccurate travel reports about the governments of Turkey, Persia, and India. These accounts, he claimed, overlooked the rule of law, the role of private property, and other elements of sociological and political density that Montesquieu claimed did not exist in despotic regimes. More damningly, Anquetil maintained that, despite the best intentions, Montesquieu so distorted the East that he inadvertently justified European colonial expeditions. An emphasis on the allegedly backward or primitive elements of non-Western societies emboldened Europeans to seize control of them in the name of enlightenment and, later, progress. A theory designed to denounce despotism at home thus provided an excuse, according to Anquetil, for practicing it abroad (Behdad 1989; Richter 1973, 12-3; 1995; Shackleton 1988, 239; Venturi 1963, 137–9; Young 1978).

In our own time, we can find situations in which a portrait of fear intended to mobilize opposition to tyranny in one place enjoys the dubious irony of defending tyranny in another. Consider the strange career of Hannah Arendt's (1951) acclaimed account of totalitarianism. Although Arendt argued that totalitarian terror was of a radically different order than the despotic terror envisioned by Montesquieu, her analysis owed more to his description than she admitted. According to Arendt, terror keeps people in such a state of permanent dread that they cannot act in any but the most predictable ways. Its victims are stripped of the capacity for "spontaneous human action." They merely behave, repeating patterns of human motion prescribed in advance by nature or history. Under Stalin, they march as unthinking soldiers in an advancing column of history. Under Hitler, they are the germ-free bearers of a racially cleansed society. In either case, they have forsaken the last vestige of humanity—the ability to defy expectations, break patterns, forge new courses. There are no criminals in these regimes because no one is capable of transgression. "Guilt and innocence" thus "become senseless notions." Fear cannot even serve the function of selfpreservation. It loses "its practical usefulness" because "actions guided by it can no longer help to avoid the dangers man fears" (Arendt 1951, 465-7). As in Montesquieu's account of despotism, the social world of totalitarianism has been pulverized. Classes give way to masses, and individuals now find themselves without the protective contours of a hierarchical society. Limited government, the rule of law, decentralized power-all these checks against despotism are eliminated as the totalitarian state imposes an entirely new order of sentiment and being upon a population of rootless and exposed men and women. Arendt's description of the totalitarian state does feature some departures from Montesquieu, but it nonetheless recapitulates and

extends his basic defining elements of despotism (pp. 311-26, 392-437).

Like Montesquieu, Arendt was inspired by an astringent moral vision, a vision of opposition to tyranny anywhere and everywhere. But in the hands of her followers, the portrait of total terror came to justify a defense of "traditional" authoritarian regimes on the ground that these are less toxic than totalitarian regimes. Jeanne Kirkpatrick, the preeminent theoretician of American foreign policy during the 1980s, drew upon this familiar account of fear to defend American opposition to Marxist governments and support for regimes such as those in Chile, El Salvador, and South Africa. In a widely discussed article, Kirkpatrick (1979) claimed that Somoza's Nicaragua and the shah's Iran were soft tyrannies in which the state tolerated the multiplicity and diversity of traditional society. These autocracies were far less terrifying than Marxist regimes, which destroyed mediating institutions, emptied civil society of traditional elites and traditional values, and installed an all-powerful, all-knowing state. Standing in solidarity with friendly despots, then, could serve a humane function: It would help ward off the more lethal terror of communist totalitarianism.

More recently, the idea of total terror has inspired much of the revival in Europe and the United States of the concept of civil society. Contemporary theorists now envision intermediary, nonstate institutions as a counter to the statist tyranny that has disfigured so much of the twentieth century. Some theorists even claim Montesquieu as an intellectual forebear. It remains unclear what the consequences of this most recent incarnation of the idea of total terror will be, but we can see some of the same tropes. The family and other close circles of intimacy are presumed to be destroyed by totalitarianism, as are those spaces of civil society not directly under the control of the state. Therefore, to avoid the totalitarian temptation, we must cultivate them anew. Zones of familial and fraternal feeling must be revived to create space for an alternative logic. The dense spaces of a richly textured civil society will foster an ethic of personal loyalty and commitment; regardless of whether this ethic is political, by virtue of not being under the control of the state, it will serve as a counter to tyranny (Cohen and Arato 1992; Elshtain 1995, 38-9, 42-3, 45-52; Gray 1993, 158; Keane 1988; Taylor 1995a, 204-5, 214, 222; 1995b, 185, 211).

But how illuminating is this account of total terror? Is it true that fear destroys the person, that it liquidates the family and other institutions of civil society, that we lose all capacity for reason, emotion, and other defining elements of selfhood? The Persian Letters offers an alternative way of viewing the relationship between fear and the self, the state, and civil society. Many of those elements that we have come to believe are antithetical to fear can be reconciled with it. Some of those elements, in fact, can be crucial to the creation and maintenance of fear. Was this account merely the literary speculation of an eighteenth-century Frenchman? Evidence from one of the most notorious episodes of twentieth-century fear suggests otherwise.

For Western intellectuals, perhaps no single event of the twentieth century better captures Montesquieu's vision of total terror than the Moscow show trials of the late 1930s. In a series of staged public events, Stalin trotted out leaders of the Bolshevik revolution who confessed to fantastic crimes against Lenin, socialism, and the Soviet regime. The repression of political opponents and even show trials were hardly unprecedented, but the willingness of political luminaries to denounce themselves seemed to open a new chapter in the history of terror. The most stunning confession came from Nikolai Bukharin, the principal theoretician of the communist movement and beloved heir to Lenin, who admitted that he was the ringleader of a counterrevolutionary conspiracy. How could an individual of Bukharin's stature, a revolutionary leader hailed throughout the world, confess to such extraordinary crimes? It could only mean that he had lost all sense of self, that he was so engulfed by terror that he no longer cared enough to preserve his own life. Bukharin's willingness to cooperate in his own destruction appeared to signal the unhappy triumph of Montesquieu's vision: Terror was indeed the great nullifier of selfhood. In his famous novel, Darkness at Noon, Arthur Koestler (1941) turned Bukharin's actions into a parable of the relationship between totalitarianism and the eclipse of the individual. Bukharin's cooperation with Stalin also inspired a film by Jean Luc Godard, La Chinoise (Cohen 1980, 372, 473; Conquest 1968, 132-3; Koestler 1941; Tucker and Cohen 1965, xxv-xxvi). Bukharin's self-abasement gave credence to Montesquieu's notion that fear is so consuming that it destroys the self and the self's connection to all those institutions—the family, civic associations, and so onthat might lend sustenance to the struggle for freedom and personal dignity.

As we now know, the reasons behind Bukharin's confession were quite different from those suspected by intellectuals at the time. Before his trial, Bukharin was imprisoned for a year, subjected to brutal methods of interrogation, and repeatedly threatened. Despite the threats against his body and life, he managed to hold out for three months "with remarkable vigor." What finally induced his capitulation was Stalin's threat to kill his wife and son. More than anything else, this led Bukharin to make his public confession. Threats against family members were visited upon countless victims of Stalin and proved to be one of the most effective means of securing cooperation with the regime. Bukharin and many others had no hope of saving themselves, but they did hope to save their loved ones (Cohen 1980, 375; Conquest 1968, 142, 301).

Three elements of Bukharin's decision are worth noting, both for what they reveal about the actual nature of terror and for what they show about the limitations of our conventional analysis. First, Bukharin felt a strong connection to his family. In fact, it was precisely his love for his family that made him afraid enough to cooperate with Stalin. Second, Bukharin made a clear choice based on certain calculations. He believed his confession would lead to a desired good, whereas his refusal would only lead to a feared evil. In

order to make this choice, he had to understand the relationship between his actions and a desired result. He had to think of himself as an agent. Finally, Bukharin was inspired by a desire to outlive himself. He hoped that his family would survive to tell his story. He thus had to think about the future—beyond his own lifetime—and he had to have enough self-regard to believe that his name and his story were worth preserving. For that reason, he inserted all sorts of qualifications into his public confession, which provide close readers of the trial transcript multiple clues about his innocence, the evil of Stalinism, and his place as Lenin's true heir (Cohen 1980, 376–80; Tucker and Cohen, 1965, xlii—xlviii).

Despotic terror does not rob us of our capacity for reason, love, or selfhood. It preys upon these capacities to force us to act in ways we do not wish to act. When we love the members of our family, a despotic regime will ask us to choose between their survival and actions we do not wish to undertake. Montesquieu's followers might reply that every despotism has its share of Bukharins, that we always can find some incidental case of honor or familial love amid despotic terror. But, they might continue, these cases are not constitutive of the regime's power. They survive despite the regime.

It seems to me that quite the opposite is true. It was Bukharin's sense of honor and virtue—his desire to protect his family, his name, and the movement he worked to create—that motivated his cooperation with Stalin. If Bukharin had not cared about his family, would he have agreed to a public confession and public humiliation? He might just as well have chosen silence or a private execution. There were individuals who refused to make public confessions, and a number of them had no children (Conquest 1968, 142). Beyond Bukharin himself, it is these connections between human beings and the human capacity to make choices between the lesser of two evils that sustain fear. Particularly under despots such as Stalin who recognize no limits to what they will threaten, these capacities can be crucial to coercing even the most resolute opponents. Were it not for the human capacity to imagine and carry out the most horrifying evils-and were it not for the equally human capacity to choose between those evils—these regimes might not have such sway.

There is something almost perversely comforting about our conventional vision of terror. It suggests that the victims of fear somehow escape its horror because they are so dehumanized, so divested of civilization, that they cannot register the cruelty being visited upon them. They suffer, but it is only we, the spectators, who grasp the catastrophe. In reality, despotic terror seldom allows its victims the refuge of insanity or the grace of unawareness. It forces rational men and women to be conscious witnesses to and active participants in the carnage that surrounds them. The notion of total and absolute terror is a tribute to our desire to preserve the distinctions between barbarism and civilization, fear and selfhood, terror and reason. But it is also a conceit: The tragedy of Bukharin is not that he lost all sense of self. He might have been spared a great deal of suffering if he had. It is that he was forced to reason about the unreasonable and to choose among the unchooseable. Through these choices, through discrete decisions about whether to submit or to defy, despotic terror consolidates and exercises power. Stalin got his confession; Bukharin got his family and his legacy. It was a terrible bargain, a contract of self-destruction. But it was a contract nonetheless, one upon which Stalin built his regime (Cohen 1980, 373–4; Conquest 1968, 145–7).

THE FACES OF FEAR

Seventeen years ago, Norman Hampson (1983, 3) wrote that *The Persian Letters* was the "first major work of the French Enlightenment." With its racy Orientalism, sympathetic accounts of homosexuality and incest, and thinly veiled criticism of French political culture, it challenged prevailing ideas about sex, morals, politics, religion, and culture. Almost three centuries later, the novel still emits these dissident sparks of the Enlightenment. It is as subversive as ever, although perhaps not quite in the way Montesquieu intended.

The Persian Letters forces us to rethink our assumption that political fear depends on the state's liquidation of the traditional institutions of civil society and the familiar elements of human nature. Careerism, the system of apprenticeship, and moral rules that teach the virtues of obedience are aspects of despotic rule that depend on a set of hierarchical institutions, and they are manipulated rather than destroyed by the despot. These institutions contain leaders, men and women with authority over others. When these leaders choose to cooperate with the state, they will use their relationships with their followers to instill fear among them and to encourage them to submit to the regime's dictates. These relationships between leaders and followers in civil society are the building blocks of political fear. It is the presence of these institutions and leaders-not their absence-that makes a population so vulnerable to political fear.

The collaboration between the state and civil society need not correspond to our stereotypical image of revolutionary tyranny, of a state that mobilizes civil society and whips it into a frenzy. It many of these regimes, a far more quiet association is at work. Collaboration only requires that the state either threaten something of importance to elites or hold out to them some desired good. When faced with the possibility of attaining or losing a good, these elites will put themselves at the service of the regime. As several recent studies of tyrannical regimes in Eastern Europe and Latin America have shown, collaborators work with the state for a variety of reasons (Remnick 1994; Rosenberg 1991, 1995). They seldom follow a single logic or pursue the same goals. Yet, the very range of human sympathies and diversity of aspirations enable the state to penetrate areas of public and personal life that it might not otherwise be able to regulate. The regime need only be flexible in identifying what matters to specific elites in order to compel them to cooperate. Once the regime has mapped out this diverse geography of incentives and desires, it can use its power to develop a relatively cooperative relationship with these elites, who in turn will do what they must to deliver their followers into the regime's grip.

We have come to think that fear has only one face: the face of the despot. Everyone else is a shadow of his personality. His is also a face that has been disfigured beyond recognition. It is certainly not a human face. In painting this picture, Montesquieu deliberately invoked a caricature. His distortion was supposed to jolt readers out of their complacent regard for the torture and violence of the Old Regime, violence that Foucault (1979) would later describe in such memorable detail in the opening pages of Discipline and Punish. Montesquieu sought to portray despotic fear as so monstrous that his contemporaries would no longer accept it as customary, as part of the ordinary course of events. His intentions were wholly legitimate and understandable. If today, however, we are to remain true to the Enlightenment spirit of The Persian Letters, then we must see that regimes of fear depend not only on a despot but also on a web of collaborators, each of whom has individual concerns and aspirations. We must see that there is no one face of fear but many, the faces of tyrants, elites, leaders, and followers. Most important, we must realize just how ordinary, how very human, those faces can be.

City Size and Civic Involvement in Metropolitan America

J. ERIC OLIVER Princeton University

iven the coincidence between America's recent migration to smaller, suburban cities and declines in civic participation, Dahl's speculations on the ideal-sized democratic polity have gained more pertinence. I explore the effects of city size on participation in four local civic activities using 1990 data. Controlling for both individual- and city-level characteristics, I find people in larger cities are much less likely to contact officials, attend community or organizational meetings, or vote in local elections. Lower civic participation is attributable partly to differences in social relations and psychological orientation between residents of larger and smaller places. People in big cities are less likely to be recruited for political activity by neighbors and are less interested in local affairs. These differences occur irrespective of the size of the surrounding metropolitan area and demonstrate the importance of municipal institutions for fostering civil society. The implications for studies of participation, suburbanization, and democratic political theory are discussed.

To end the alienation from government that is so prevalent in society today... the answer is not busting up a big city into a lot of small cities. You slice baloney, you get baloney.

Tom Hayden, Los Angeles mayoral candidate¹

ince the time of Aristotle, political theorists have puzzled over a difficult question: What is the optimal size for a democratic polity? In the 1967 presidential address to the American Political Science Association, Robert A. Dahl (1967, 960) offered an answer: Most democracies are too big to allow citizens actively to determine the "vital aspects of their lives in common." Small polities, however, often lack the capacity to address meaningful political issues. The idealsized unit, Dahl reasoned, must be able to achieve collective goals but avoid the "consummatory" participation of the modern nation-state. Since we seem "destined to live in cities," Dahl proposed dividing large metropolitan areas into federations of municipalities between 50,000 and 200,000 in size. These cities would be small enough to facilitate civic participation but large enough to generate meaningful political discourse.

Over the past fifty years, Dahl's vision has become a reality. Most Americans now live in small to medium-sized cities or "places" within large, densely populated metropolitan areas.² Since 1950, the proportion living in metropolitan areas has risen from 57% to 75%. Yet,

J. Eric Oliver is Assistant Professor of Politics and Public Affairs, Princeton University, Princeton, NJ 08544

An earlier version of this article was presented at the 1997 meetings of the International Society of Political Psychologists, July 12–15, Krakov, Poland. It greatly benefited from the comments of Henry Brady, Claude Fischer, Fred Greenstein, Tom Romer, Laura Stoker, Raymond Wolfinger, and the anonymous reviewers. I owe particular thanks to Henry Brady, Kay Schlozman, and Sidney Verba for making their data available and to Nancy Burns and Glen Beamer for their work in identifying the geographic residence of the CPS respondents.

¹ New York Times, May 29, 1996, p. A10.

proportionally fewer Americans reside in large cities: Less than 19% currently live in cities of more than 250,000, compared to 23% in 1950; 56% now live in metropolitan places smaller than 250,000, compared to 34% in 1950 (U.S. Bureau of the Census 1975, 1993). America has changed from a country bifurcated between isolated rural towns and big central cities to one that consists largely of small and medium-sized suburbs.

The civic consequences of this shift are unclear and the empirical research on the civic effects of city size is inconclusive. On the one hand, the migration to smaller, suburban places has coincided with a welldocumented decline in such activities as voting and organizational membership (Putnam 1995; Teixeira 1992; Wattenberg 1996). This suggests that participation is lower in smaller, suburban places, a finding supported by Fischer (1976). On the other hand, several studies report that residents of smaller places are more likely to participate (Kasarda and Janowitz 1974; Nie, Powell, and Prewitt 1969; Verba and Nie 1972). Yet, all these works fail to provide definitive evidence: Fischer's estimates do not control for many important individual-level characteristics; Kasarda and Janowitz and Nie, Powell, and Prewitt compare only "urban" and "rural" places; and Verba and Nie's results, from a sample of only 120 cases, are not statistically significant. Moreover, all these studies use data more than 30 years old, and city size has not been analyzed in the participation research since then, which means that the effects of city size are unmeasured relative to the recent trends in suburbanization.

America's metropolitan expansion also calls into question many key assumptions about city size in classical democratic theory. For instance, does it have the same effect in a metropolitan setting of contiguous municipal boundaries, uninterrupted land development, and interdependent local economies? Does Dahl's ideal democratic city of 50,000 foster as much

surrounding urbanized counties, that is, counties identified by the Census to have large portions of contiguous areas with high population density. Consequently, places of up to 50,000 population (the first two categories of city size used in this analysis) can be classified as rural or urban depending on their proximity to a metropolitan area.

² By "place" or city, I refer to all incorporated municipalities, although generally city refers to larger municipalities and place refers to smaller ones. Rural is measured as residence in any county that is not part of a metropolitan area. Borrowing from the 1900 U.S. Census (U.S. Bureau of the Census 1991), a metropolitan area is any county that contains a central city of at least 50,000 and the

civic engagement if it is in the middle of greater Los Angeles or isolated on the Kansas plains? Previous work has not examined these important questions. To complicate matters, most suburban places are not like large cities in miniature but are highly differentiated in social composition and land usage, characteristics that also shape civic participation. Oliver (1999) finds that people in affluent suburbs participate less than people in heterogeneous, middle-income places and that the effects of city affluence are greater than population size. Indeed, population size may no longer be the most important civic characteristic of a city.

The size issue also remains enigmatic partly because of the absence of any general theory on the relationship between social environments and political participation. Most social theorists either ignore civic participation (Simmel [1905] 1969; Tonnies 1988; Weber [1905] 1958; Wirth [1938] 1969) or do not link their speculations to models of why people participate in civic processes (Dahl 1967; Dahl and Tufte 1973; Montesequieu [1748] 1991; Rousseau [1772] 1994). Indeed, latter-day democratic theorists offer mostly vague and contradictory expectations about how polity size directly shapes civic involvement. Theorists of participation, meanwhile, mostly focus on individual-level factors and rarely take social context into account (Olson 1965; Rosenstone and Hansen 1994; Verba, Schlozman, and Brady 1995; Wilson 1972). Despite Lewin's (1935) nearaxiom that human behavior is a function of both individual and environmental characteristics, most studies of civic participation concentrate on models of isolated, rational actors or on hypotheses validated by individuallevel survey data. To establish causal linkages between city size and participation, a theoretical bridge between studies of context and participation is needed.

This article explores the civic ramifications of city size, particularly in contemporary metropolitan and rural settings. I start by outlining a theory about the relationship between social environments and civic activity in the metropolis using a "civic voluntarism" model. Then, based on a data set constructed from the 1990 Citizen Participation Study (Verba et al. 1995) and the 1990 Census, I estimate four types of civic activity and find them all to be lower in larger places, a relationship that occurs irrespective of the metropolitan context. Large size depresses participation partly because residents are less likely to be mobilized and are less interested in local political life. These findings demonstrate the civic relevance of municipal boundaries in an era of metropolitan expansion: City boundaries define communities, and smaller places are civically richer. Before celebrating the civic virtues of suburbanization, however, other city-level characteristics need consideration. Tom Hayden notwithstanding, smaller cities are not simply more baloney; rather, they are distinct cuts of meat, some more civically palatable than others.

CIVIC VOLUNTARISM AND SOCIAL CONTEXTS

Previous theories on the civic effects of city size are inconclusive partly because they fail to explain which factors influence participation and how they may be shaped by the social environment. For example, Dahl and Tufte (1973) make a series of deductive inferences about civic participation in large and small democratic units. They reason that "smaller democracies provide more opportunity for citizens to participate...but, larger democracies provide citizens opportunities to participate in decisions . . . to control the most important aspects of their situation" (p. 13). In their framework, a city's population does not affect the nature of the civic act: Casting a ballot or contacting a government official is essentially the same in sprawling Houston as in tiny Startzville. Rather, place size shapes participation indirectly by altering the opportunities for involvement. But Dahl and Tufte assume that smaller places provide more opportunities for participation and that availability stimulates involvement. These assumptions, however, are not based on any general theory or empirical tests. Dahl and Tufte do not demonstrate whether or how a polity's size changes the opportunities for participation, whether opportunities really do influence involvement, or what intervening characteristics may be operating. Such criticisms hold equally for other theoretical speculations (e.g., Montesequieu [1748] 1991; Rousseau [1772] 1994; Weber [1905] 1958; Wirth [1938] 1969). To overcome these deficiencies, the individual determinants of participation must be identified, and hypotheses then must be formulated on whether they differ between large and small places.

What are the determinants of political participation? A voluminous literature offers a wide range of theories (e.g., Olson 1965; Rosenstone and Hansen 1993; Teixeira 1992; Verba and Nie 1972; Wilson 1972; Wolfinger and Rosenstone 1980), but I use Verba, Schlozman, and Brady's (1995) "civic voluntarism" model. According to their framework, political participation is a function of individual resources, interest, and mobilization; people are more likely to participate if they have skills and knowledge, if they are more psychologically engaged, or if they are recruited by others. Although not explored in the original formulation of the model, each factor varies with a person's social environment. Psychological engagement in community life is clearly determined by context: When people feel they have more in common with neighbors or have a greater sense of efficacy, interest in local affairs is greater (Fischer 1976). Political mobilization varies with patterns of social interaction: When people are more familiar with one another, they are more likely to talk about politics and recruit others for action (Huckfeldt and Sprague 1995). Context even shapes the influence of individual resources: When participation is more difficult, the relevance of individual knowledge and skills grows (Wolfinger and Rosenstone 1980). By examining variations in political resources, interest, and mobilization between small and large municipalities, the causal connection between city size and participation can be specified.

Previous research in this area has arrived at strikingly contradictory conclusions. On one side are those who argue that both psychological engagement and mobilization increase with a city's population. Dahl (1967) and Deutsch (1961) believe larger places have more compelling issues to attract citizen attention; Fischer (1995) and Suttles (1972) find that larger places host more subcultures that mobilize citizens; Milbrath and Goel (1982) claim that greater media attention to big city politics stimulates citizen interest; and Dahl and Tufte (1973) speculate that larger polities have a higher level of political competition that mobilizes citizens and makes their participation more efficacious.

On the other side are those who suggest that a large population is a detriment. Early classics of urban sociology (Simmel [1905] 1969; Tonnies 1988; Weber [1905] 1958; Wirth [1938] 1969) argue that the size, density, and heterogeneity of larger places dissolves the social and psychological bonds that exist between neighbors in small towns. Surrounded by more strangers and greater social uncertainty, urbanites putatively seek psychic refuge in their primary social relations, shy away from formalized social contact, or feel content as "bystanders" to the political process (Finifter 1970; Latane and Darley 1970; Nie, Powell, and Prewitt 1969; Reisman 1953; Verba and Nie 1972). In addition, people in larger places are less likely to know their neighbors, have mutual friends, and see acquaintances in public settings (Fischer 1982; Lofland 1973), which in turn may inhibit political mobilization (Huckfeldt and Sprague 1995). Finally, even though the act of participating may be the same in different cities, the costs of doing so may vary. Larger cities require a more complex bureaucracy, have greater spatial distance between city offices and citizens, and have elected officials who represent more people, all of which may increase the difficulty of participation and the importance of individual resources (Hansen, Palfrey, and Rosenthal 1987).

These issues are further complicated when one considers that most Americans do not live in isolated towns but within larger metropolitan areas. Most studies designate large cities as "urban" or "metropolitan" and small places as rural, but Dahl's speculations suggest that municipal boundaries are important in their own right for defining community and patterns of social interaction. Thus, when considering population size, the effects of living in a municipality must be distinguished from living in a large urbanized area.

On the one hand, if city boundaries are unimportant amid a surrounding urbanized population, then the effects of metropolitan areas should both replicate and overshadow the effects of city size; it should not matter whether people are partitioned by the invisible walls of a municipal border. The important contextual element, in this instance, is the number of people in a given geographic region, not simply the number within a particular municipal jurisdiction. The major contextual influence on civic involvement will be the size of the metropolitan area and not the particular city, and the largest differences in participation will occur between small rural places and large metropolitan regions.

On the other hand, if city boundaries are important for defining the character of local political engagement or patterns of social interaction, then the metropolitan

environment should not alter the place-size effects. Differences in participation between people in large and small places should occur irrespective of the size of the surrounding metropolis because political engagement and mobilization arise primarily from the community as defined by the city boundaries. If this is true, then residents of small places in both rural and metropolitan settings should have equal levels of participation relative to their counterparts in large cities.

In sum, if larger places stimulate citizen interest and nourish a variety of subcultural social networks, then participation should increase with population size; if greater size produces alienation and social disconnection or makes involvement more costly, then participation should decline with population gains. But the effects of metropolitan contexts may hinge on the importance of city boundaries for defining social behavior and political attitudes. If the boundaries are important, then the size of the surrounding area will not alter the effects of city size; if the boundaries are less important, then metropolitan effects will supplant the relationship between city size and participation, and larger differences should exist between rural and metropolitan areas.

DATA AND ANALYSIS

Testing these assertions requires overcoming the classic difficulty of cross-level inference. Most data on citizen activity are either aggregate (e.g., statistics on precinct or county voting) or individual (e.g., surveys), which greatly restricts contextual induction (Achen and Shively 1995). An appropriate test of the effect of contemporary metropolitan social contexts requires information not only about individuals and their context but also a sample from a wide variety of places. To meet these criteria, I constructed a data set from the 1990 American Citizen Participation Study (CPS) (Verba et al. 1995) and the 1990 Census (U.S. Bureau of the Census 1991). The CPS is a national, crosssectional survey of the participatory activities of the American public; among the approximately 15,000 respondents in the screener set, 2,500 took part in in-depth follow-up interviews. For this analysis, I use data from the follow-up interview portion of the CPS. These respondents were drawn from more than 800 different places. In order to measure the effects of social context, the respondents' residence was identified, and data from the 1990 Census for the summary level of place (i.e., city) were matched for each case.³ With this individualized census information for such a large nationwide sample, the relationship between measures of social context (e.g., population size, median income) and individual behavior can be estimated while controlling for individual-level determinants, such as education, income, and age.

After constructing an appropriate cross-level data set, I then had to decide which civic behaviors to

³ Thirteen percent of the interviewees (N = 2,500) were omitted because they did not live in identifiable municipalities or under municipal jurisdictions.

examine. These range from voting to joining voluntary organizations (Putnam 1993; Verba, Schlozman, and Brady 1995), and studying the relation of all to city size is impossible in a single article. Moreover, not all civic activities are equally susceptible to contextual influences. For example, social context should influence turnout in local elections more than in national elections. To estimate the consequences of city size, civic behaviors should be local in orientation, politically directed, and foster the type of social bonds that form the basis of civil society (Putnam 1993).

I chose four variables that best meet these criteria: Contacting Locally Elected Officials, Attending Community Board Meetings, Attending Meetings of Voluntary Organizations, and Voting in Local Elections. All these activities are not influenced by social context in exactly the same way, but all represent important aspects of locally oriented participation. Contacting officials and voting are the two most direct ways people communicate their preferences about local policies to local leaders. Attending the meetings of community boards and voluntary organizations, as Putnam (1995) argues, sustains the "norms and networks of reciprocity" upon which civil society is built.4 Furthermore, participation in each of these activities should be sensitive to the incentives and opportunities discussed above. If all these acts are influenced by interest and mobilization, as Verba, Schlozman, and Brady (1995) suggest, then the effects of city size should be consistent across all.

FINDINGS

I start by comparing average rates of participation in all four civic activities across five categories of city size (less than 5,000; 5,000 to 50,000; 50,000 to 250,000; 250,000 to one million; and more than one million); residents of metropolitan and rural areas are separated in the first two categories. The participation measures are based on self-reports. Contacting officials and attending meetings are scored dichotomously (1 if the respondent had engaged in the activity in the past year, 0 otherwise); voting in local elections is measured on a five-point scale (1 = never to 5 = always). A full description of the variables is given in the Appendix.

With the exception of voting in local elections, the average rate of participation in all types of civic activity tends to decline in larger places, although this effect is primarily limited to residents of metropolitan areas. As depicted in Figure 1, 40% of residents of metropolitan places of less than 5,000 report contacting local officials, compared to 30% in places between 5,000 and 50,000 and 25% in places of more than one million. Meeting attendance is 13 percentage points lower in the largest than in the smallest places for community boards, and 12 percentage points lower for voluntary organizations. The average local voting score declines

by .2 points between metropolitan places of less than 5,000 and those between 50,000 and 250,000 but then levels off. Among residents of rural towns, contacting and voting rates decline between small and larger places, but attendance at community board or organizational meetings increases. On average, rates of participation in civic activities are lower in the smallest rural towns than in places of the same size within metropolitan areas. For example, the average rate of attending community board meetings is 9 percentage points lower in rural than metropolitan places of less than 5,000.

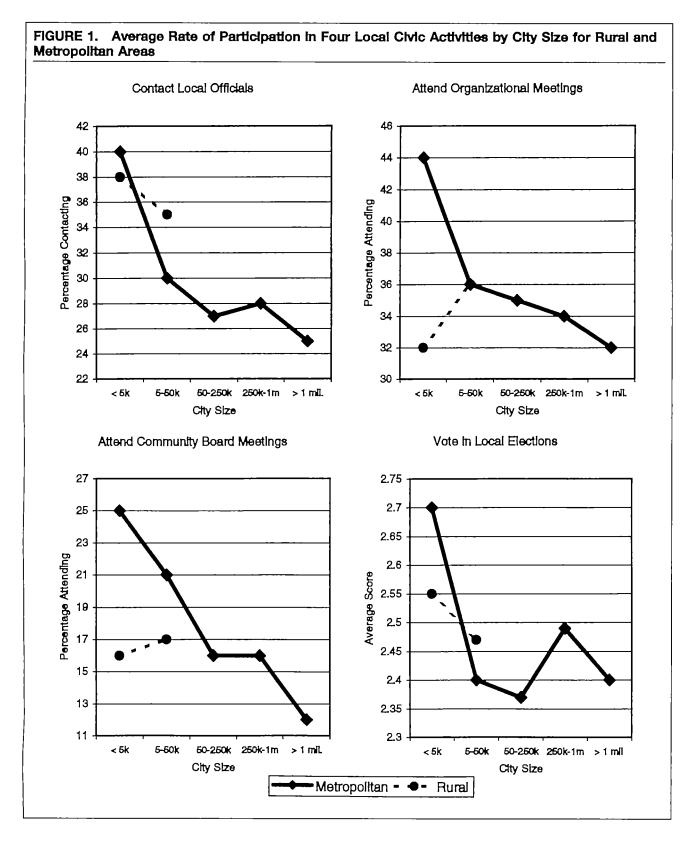

On the whole, these figures support the hypothesis that civic participation diminishes in larger places, at least in metropolitan areas. For three out of four indicators, steady decline occurs with an increase in place size. The highest participation rates are in the smallest metropolitan places. In rural areas, however, the relationship between population and civic participation differs in two respects. First, in towns of less than 5,000, participation rates are typically much lower in rural than metropolitan areas. Second, unlike the pattern in metropolitan areas, participation does not necessarily decline as rural size grows. Indeed, residents of rural places larger than 5,000 are more likely to attend board and organization meetings and are only slightly less likely to vote or contact officials than are rural dwellers in very small towns. What accounts for these rural anomalies?

Part of the answer may lie in demographic differences rather than social context (Finifter and Abramson 1975), so demographic profiles are worth exploring in further detail. Table 1 lists average levels for Years of School Completed, Age, Percent Homeowners, and Median Household Income by place size for rural and metropolitan areas in the CPS/Census sample.6 Compared to all residents of metropolitan areas, rural dwellers on average have completed almost one year less of school and live in places with a median annual household income almost \$10,000 lower. As both an individual's education and city-level income are important determinants of civic participation (Oliver 1999; Verba, Schlozman, and Brady 1995), these lower resource levels may explain lower rural participation. Yet, rural residents are older and more likely to own a home, individual factors that correlate with higher participation rates. Furthermore, despite the steady decrease in civic participation within metropolitan areas, there are few demographic variations by size: Residents of small metropolitan places have, on average, levels of education, income, and age similar to those of people in large cities. The only demographic variance is that people in smaller places in metropolitan areas are more likely to be homeowners. Given at least some confounding demographic characteristics, multivariate equations are needed to isolate the specific effects of city size on participation.

⁴ Given Putnam's (1995) speculations about the importance of face-to-face contact in voluntary organizations, I chose meeting attendance rather than membership as the measure to gauge local "social capital"

⁵ All analyses for this article were conducted with SPSS for Windows, version 8.0.

⁶ The CPS measured individual income on an eight-point scale, so I used the measure for the median household income of the city from the 1990 Census as a measure of income differences by place size and metropolitan/rural context.

Toward this end, I employed a logistic regression for the three dichotomous participation items and an ordinary least squares (OLS) regression for the voting scale. Each measure was regressed on several explanatory measures: *City Size* (measured in ten increments along a 0-1 scale); dummy variables for residence in Rural areas and Small Metropolitan Areas (less than one million), with residence in a metropolitan area of more than five million counted as the excluded category; an interaction term between city size and rural residence (city size × rural); individual characteristics associated with civic participation (Verba, Schlozman, and Brady

TABLE 1. Average Education, Age, Home Ownership, and Median Household Income by Place Size for Rural and Metropolitan Areas

Sources: The multi-level data in these analyses are combined from two separate sources. The variables measuring individual participation and demographic characteristics (i.e., education, age, etc.) come from the 1990 Critizen Participation Study (Verba et al. 1995). For each respondent in the CPS, the place of residence was identified and indicators of city population size, median household income, percentage black, metropolitan area size, and rural residence were appended from the 1990 Census of Population and Housing (U.S. Bureau of the Census 1991)

1995), such as Education, Age, Income, Length of Residence, Marital Status, Homeownership, race (Black), and sex (Female); and two other city-level social characteristics: affluence (Median Household Income) and racial composition (Percentage Black). To control for regional effects, I included South as a dummy variable. The coefficients from the equations are presented in Table 2, and a full description of the variables is given in the Appendix.

Controlling for other individual and city-level characteristics does not alter generally the negative relationship between civic participation and city size. Comparing the predicted rates of participation between the smallest and largest places, the likelihood of contacting local officials drops by 16 percentage points, attending organizational meetings by 8 percentage points, attending community board meetings by 18 percentage points, and voting in local elections by .14 points on a five-point frequency scale (from an average score of 2.5 to 2.36).8 The city size coefficients are statistically

⁷ A multitude of social characteristics distinguish American places (Berry 1972), but racial and economic segregation is routinely identified as the most important by-product of suburbanization

(Massey and Denton 1993; Schneider 1987). Therefore, in distin-

guishing among suburban places, I use measures of median household income and percentage black. significant in all equations except the one predicting voting.

These findings have several points worth noting. First, the relative size of the coefficients demonstrates that city size is itself a powerful predictor of local civic activity. For example, the logistic coefficients in Table 2 for the three equations predicting nonelectoral participation are larger for city size than all other individual-level variables except for education, age, and income. In other words, the differences in contacting officials or attending meetings between very small towns and the largest cities are greater than those between renters and homeowners, men and women, or married and single people.

Second, the predicted participation rate steadily declines as population increases. Alternative tests for a curvilinear relationship between city size and participation are generally negative.¹⁰ The model predicts

the value of the city size coefficient multiplied by the value of each increment along the city size scale

⁹ Of course, because of the nonlinear character of the logistic regressions, the comparative magnitudes of the independent variables cannot be estimated perfectly from the coefficients. To calculate the relative effect of one coefficient compared to another, a probabilistic function for each variable, as described in note 8, must first be estimated. For example, translating the coefficient for education (2.14) in the equation for contacting generates a predicted difference of 34 percentage points between those with only eight years of education versus those with an advanced degree. Nevertheless, comparing all the translated coefficients, the differences across city size are still larger than differences across any individual level variable except education, age, and income, just as the raw coefficlents indicate. For example, the predicted differences in the rate of contacting officials across the city size scale (16 percentage points) is greater than that between renters and homeowners (6 percentage points) or men and women (5 percentage points).

For instance, when a squared term for city size is included in the equations, no large or statistically significant coefficients are generated. The relationship between city size and civic activity also can be found by breaking the size variable into nine dummies, with residence in a city of more than one million as the excluded category, and reestimating the equation. When this was done, the coefficients for the dummy variables progressively dwindled as city size increased in all three equations in which size had a significant effect on civic

involvement.

⁸ The aggregate marginal effect of city size on the probability of participating was calculated by first using the logistic coefficients to compute a predicted probability of participation (p) for each person in the sample: $p(x) = F(B_0 + B_1 + ... + B_n X_n)$. A second probability was calculated using the same equation except that for each respondent the lowest value of the city size scale (0) was substituted for the regular city size term. After recalculating both probabilities relative to the base of the natural logarithm, the difference between the two probabilities was then estimated for each respondent and the average scores were taken for each increment of the city size scale. For a full description of this procedure see Wolfinger and Rosenstone (1980, 123). Using this procedure, the logistic coefficient for city size in the equation predicting contacting -.712) translates into a predicted average difference of 16 percentage points between residents of places with population of less than 2,500 and those in places with population of more than one million. For the OLS equation, the predicted effect of city size was derived by setting all other independent variables to their means and adding these to the constant term. This new average rate was then added to

Source: See source note for Table 1

that, ceteris paribus, residents of a city such as Woodside, California (pop. 4,300), are 8% more likely to attend a local community board meeting than those in nearby Cupertino (pop. 41,000), who are 6% more likely to do so than people in neighboring San Jose (pop. 750,000). The effect of size is continuous: The larger a city becomes, the less likely are its citizens to participate in local affairs.

Finally, the effects of city size seem largely independent of the greater rural or metropolitan context. The coefficients for the interactive term in all four equations is small and not statistically significant. People in smaller rural places and in smaller suburban places are equally more likely to participate relative to people in large cities. In other words, the model predicts that compared to those in a city like Los Angeles, in a city the size of Santa Monica, California, residents are no less likely to participate in local civic activities than are people in rural and identically sized Sioux City, Iowa, even though Santa Monica is nestled within a metropolitan area that is 20 times as large.

On the whole, there are almost no differences in civic behavior according to either the size of the metropolitan area or whether the setting is rural. By itself, city size has no effect: None of the equations predict significant differences in participation between residents of small and large metropolitan areas. Moreover, controlling for size generally has little influence on the magnitude of the city size effect, as the predicted variations in participation by city population are roughly the same in the multivariate equations as they are in the cross-tabulations illustrated in Figure 1. The only civic activity that does vary between metropolitan and rural areas is attendance at community board

meetings. Like the findings in Figure 1, people in rural places are less likely to attend community board meetings than people in metropolitan areas. But beyond this, rural dwellers living in similarly sized places are no less likely than people in metropolitan settings to undertake any other civic activity, such as contacting officials or voting in local elections. Most of the differences in participation rates between metropolitan and rural settings are the consequence of individual demographic characteristics.¹¹

The constancy of the city size effect demonstrates the importance of urban boundaries for shaping civic life. Most theories assume that people react to their city as a contained community, even if it is part of a larger metropolitan area. For example, the hypothesis that people in smaller places are more politically engaged is predicated upon the assumption that they respond to their city as their primary environment, rather than their metropolitan area. We assume that Santa Monicans are more likely to engage in community life or know their neighbors than are Los Angelenos because the boundaries of Santa Monica somehow define a

^{**}p < .01, *p < .05, standard errors are in parentheses.

^{*}Coefficients from OLS regression

Excluded category is metropolitan area of more then one million

Other multivariate analyses demonstrate that, controlling for just city size, rural residents are less likely to attend organizational meetings and vote. When the variables measuring everything but education and income are included, people in rural areas continue to have a lower participation rate, although the differences are no longer statistically significant. Adding the education and income measures greatly attenuates the rural coefficients. This suggests that the lower levels of rural participation are due largely to socioeconomic differences. Interestingly, no matter what controls are added, rural dwellers are always more likely to contact local officials, although this difference is not statistically significant, and always less likely to attend community board meetings, a difference that is statistically significant.

Source: See source note for Table 1

community with which its residents identify, even though the physical demarcation may be nothing more than a signpost. The absence of any interaction effect based on rural area validates this interpretation. City boundaries are important for defining social behavior and perceptions, even when that city is nestled within a huge metropolis.

CAUSES OF THE CITY SIZE EFFECT

According to my usage of the civic voluntarism model, the lower participation rates in larger places must result from differences in resources, political interest, and/or patterns of political mobilization. The source of the effect can be identified, therefore, by estimating how each determinant of participation changes with a city's size and then gauging how much the city size effect attenuates once these determinants are controlled.

Previous research focuses considerable attention on individual resources relative to the costs of participation (Rosenstone and Hansen 1994; Verba, Schlozman, and Brady 1995; Wilson 1972). For instance, Wolfinger and Rosenstone (1980) argue that the elderly and educated are more likely to vote because they have more resources to deal with the "costs" of electoral registration, particularly in states with difficult procedures. These individual differences in resources may be similarly relevant to city size if, as some researchers suggest, participation is more difficult in larger places

(Dahl and Tufte 1973; Hansen, Palfrey, and Rosenthal 1987; Verba and Nie 1972). Faced with larger and more complex bureaucracies, greater distances to public offices, and political organizations of larger scale, people in big cities may find voting, contacting officials, or attending meetings difficult.

If participation is more "costly" in larger places, then the effects of city size should vary according to individual resource levels. Just as the young or uneducated are less likely to vote when registration is more difficult (Wolfinger and Rosenstone 1980), so should these "resource poor" groups be more adversely affected by city size. In other words, if contacting an elected official is more difficult in Chicago than in Peoria, Illinois, then differences in contacting rates between high school dropouts and college graduates should be greater in Chicago. To test this hypothesis, I reestimated the civic participation equations with new interaction terms between two levels of individual education (High School [diploma] or Less and Some College) and city size (city size \times high schl., city size \times some col.). Those with a college degree or postgraduate education were the excluded category. The results are listed in Table 3.

In none of the four equations did the interaction terms between individual education and city size yield any large or statistically significant coefficients. The equations predict that the effects of city size are no different among differentially educated groups. Similarly negative results were also found when other measures of individual resources (e.g., age and income)

^{**}p < .01, *p < .05; standard errors are in parentheses.

^{*}Coefficients from OLS regression

^bExoluded outegory is metropolitan areas of more than one million

were substituted for the education measure.¹² These results provide no evidence that civic participation is lower in larger places because it is more "costly."¹³

Since the city size effects do not arise from variations in the cost of participation or individual resources, they must come from differences in political interest or mobilization. Previous empirical work offers inconclusive evidence that people in larger places are less engaged in community life or less likely to be mobilized. Fischer (1976, 1982) reports little evidence of any distinct psychological patterns in large places, but he does find city dwellers more "estranged from the wider community" than rural dwellers: The former are less trusting of strangers, less familiar with neighbors, and feel less efficacious with respect to community affairs. Similarly, Finifter (1970) reports that people in larger urban centers are more politically estranged. Yet, it is unclear whether these findings can explain the decline in civic participation, because none of the studies link urban alienation to lower participation. It is generally assumed, however, that political interest increases with city size because the stakes of political contests, the number of participants, and the visibility of local politicians are all higher (Verba and Nie 1972). In large places, residents have an easier time following local politics and, therefore, are thought to be more interested in local affairs. It is not less plausible that people in larger places may feel more removed from their community, so political interest may be low. Despite the greater stakes and visibility of local politics, residents may "tune out" as part of their psychological disengagement from their surroundings.

Previous research also suggests that patterns of political mobilization may vary as a function of city size (Fischer 1982). In small towns, social networks are portrayed as closely knit, in that people are more likely to know one another. In large places, social networks are typically characterized as loosely knit; there is less proximity and redundancy among acquaintances (Bott 1971; Kasarda and Janowitz 1972). Patterns of recruitment should differ, therefore, between these environments: Information about and recruitment for local activities between neighbors should be greater in small towns than in large places.

To test whether differences in psychological engagement or mobilization are the source of the city size effect, I return to the CPS/Census data set. Although the CPS does not contain any explicit indicators of political or social alienation, it does have items that

measure interest in local and national politics. These may capture some level of psychological disengagement. Respondents were also queried about whether they had been asked by someone to take part in a number of community oriented activities, including serving on a community board or contacting a local public official. From these questions, a dichotomous measure of mobilization was created (1 = asked in the past year to contact a local official or serve on a community board, 0 otherwise). An OLS regression was employed for the political interest items, and a logistic regression was done for the mobilization measure, with the same predictors used above. The coefficients for the equation are listed in Table 4.

In larger places there is significantly less interest in local politics than in smaller places. Compared to people in places smaller than 2,500, people in cities of more than one million score nearly .40 lower, on average, on the five-point local political interest scale. But this negative relationship does not appear to reflect any generalized aversion to politics among urban residents. When national political interest is regressed on the same set of predictors, the coefficient for city size is small and not statistically significant.

People in larger places are also less likely to be politically mobilized. Translating the coefficients into probabilities, residents of the largest cities are 17% less likely to be asked to serve on a community board or contact a government official than are residents of small towns. Further analysis indicates that the character of mobilization changes with place size as well. Residents of large cities are much less likely to be mobilized by friends or neighbors than are people in small places. Aside from individual education, age, and income, city size is the greatest predictor of whether a person is mobilized. As with the earlier findings, these results occur irrespective of the rural or metropolitan area. 16

Are these lower levels of local political interest and mobilization in larger places responsible for the decline in civic participation? The answer can be found by reexamining the relationship between place size and civic activity while controlling for local political interest

¹² To test the interaction between income and city size, three income categories were created: less than \$25,000, between \$25,000 and \$50,000, and above \$50,000. Interaction terms for the first two categories and city size were included in the equation. In no case were the coefficients for the interaction terms large or statistically significant. Similarly negative results were found when interactions between senior citizens (over 65 years) and city size were created.

¹³ Another test of participation cost was based on the assumption that participation in larger places is more time consuming. The CPS had several items measuring free time, although these are subject to numerous criticisms (see Verba, Schlozman, and Brady 1995). Although people in larger places did report less free time, controlling for free time had no influence on the relationship between city size and any of the civic activities.

¹⁴ Using the procedure described in note 8, I translated the logistic coefficient in the equation predicting mobilization depicted in Table 4. The logistic coefficient (-.496) translates into a difference of 17 percentage points between residents of the smallest and largest places.

¹⁵ Respondents in the CPS were also asked who had mobilized them. Selecting those who had been mobilized, I created two dichotomous measures: whether a person had been mobilized either by a friend or by a neighbor. These two items were then regressed on the standard set of predictors. In both cases, the city size coefficient was large and statistically significant. Translating the logistic regression coefficients into probabilities, mobilized respondents in small towns are 16% more likely to be mobilized by an acquaintance and 13% more likely to be mobilized by a neighbor than are people in larger places, which further demonstrates that the latter are less likely to have social contact with their neighbors.

¹⁶ Running the same equations with interaction terms between metropolitan area and city size yielded no statistically significant additional effects of city size in larger as opposed to smaller metropolitan areas.

and mobilization. If civic activity diminishes in larger places because residents are less likely to be recruited by their neighbors or are more alienated, then the relationships between place size and participation should attenuate once the interest and mobilization items are included in the equations. To test this assertion, I reestimated the regression equations for each civic activity with the four-point local political interest scale and a dummy variable for mobilization. The results are given in Table 5.

When political engagement and mobilization are taken into account, the negative relationships between place size and three of the civic activities attenuate. For example, comparing the findings in tables 2 and 5, the difference in the rate of contacting local officials between the smallest and largest places diminishes from 16 to 12 percentage points. The gap in attendance at organizational meetings also shrinks—compared to people in the largest places, residents of places smaller than 5,000 are only 3% more likely to attend organizational meetings once political interest and mobilization are considered, a difference that is no longer statistically significant. On the voting scale, the city size coefficient drops by more than half. The predicted rate of board meeting attendance is only slightly diminished by the additional controls. Nevertheless, across three measures of civic participation, the effects of place size are clearly related to differences in levels of political interest and mobilization.

Yet, even when differences in interest and mobilization are considered, the negative effects of city size on participation remain, particularly for contacting officials and attending board meetings. Does this mean that city size has other effects not considered here?

This is a difficult question to answer. The measures of citizen interest and mobilization are crude indicators for the concepts outlined in the civic voluntarism model. A better test would be measures of trust, levels of contact with neighbors, and more detailed items on mobilization for each particular civic act. One may also wonder about other contextual factors that are correlated with city size. For instance, participation may be lower in larger places because of fewer intermediary institutions to facilitate involvement, such as neighborhood groups or civic clubs (Berry, Portney, and Thomson 1993). Unfortunately, no data are available to determine whether the number of such groups varies as a function of city size. It is quite plausible that other factors underlie the city size effect, but uncovering them awaits further research with better data.

CONCLUSION

Residents of larger places are much less likely to participate in a variety of local civic activities than are people in small communities. Between the smallest and largest places, the predicted rate of contacting officials falls by 16 percentage points, attendance at community and organizational meetings declines by more than 8 percentage points, and the reported frequency of voting in local elections drops substantially. Subsequent analyses demonstrate at least two sources for the place size effect. First, people in larger communities are less likely to be mobilized for political activity, particularly by neighbors or acquaintances. The absence of mobilization stems partly from the character of social relations in larger places: As city size increases, people are less likely to know their neighbors and less likely to

have social contacts that are geographically proximate (Fischer 1982). In this environment, local organizations and political movements find it hard to recruit members and disseminate information, which limits many opportunities for participation. Second, despite the greater visibility and stakes of local politics, people in larger places are less interested in local affairs. This may arise from a psychological response to the complex urban environment, namely, withdrawal into a more private-regarding orientation. None of these explanations is mutually exclusive, and all illustrate the general principle that as city size grows, people are less socially connected with their neighbors, less interested in local politics, and less active in local civic affairs.

These results have several implications for research on participation and urban political theory. First, social context has a large and independent effect on civic participation. Most studies of American political participation use random samples to validate models of individual behavior, but people do not live in randomized relation to one another but in specific social and political settings. These settings influence participation in systematic and predictable ways. Indeed, the variations in political participation between the smallest and largest places are often greater than differences between high school and college graduates, homeowners and renters, or single and married people. By using multilevel data that contain information on both the individual and aggregate level, a broader range of factors can be estimated. Given the magnitude of these findings, future research should pay closer attention to

differences in social and political contexts when analyzing determinants of civic participation.

Second, city boundaries are very important for creating community in an era of metropolitan expansion. One might not expect a rural town such as Muleshoe, Texas, to have the same civic culture as a similarly sized suburb of New York, such as Ho-Ho-Kus, New Jersey. After all, Ho-Ho-Kus residents have a larger surrounding social universe from which to draw. Yet, I find no interaction between metropolitan or rural area and city size in shaping participation, once other demographic characteristics are taken into account. The model predicts that residents of Ho-Ho-Kus and Muleshoe are equally more likely to participate in civic life than are New Yorkers. In the American metropolis, municipal boundaries are as important for defining the social interaction and psychological orientation of residents as they are for demarcating size. Despite the fact that boundaries in many metropolitan areas are invisible amid a continuous urban sprawl, they nevertheless influence the behavior of the residents within them.

These results suggest that Dahl's speculations about the ideal-sized democratic city are correct: People in smaller places are more civically involved. But if this is the case, then why has America's migration to smaller places coincided with a putative decline in civic involvement? Although I do not have data to estimate the effect of suburbanization over time, the results of the cross-sectional analysis and my other research with these data can provide a partial answer. On the one hand, breaking up large urban areas into collections of

Excluded category is metropolitan areas of more than one mallion.

small and medium-sized municipalities should create communities with more socially, psychologically, and civically involved citizens. On the other hand, smaller places in a metropolitan context are rarely uniform in social composition. In fact, they have strong incentives to differentiate themselves in the types of services they provide and the residents they seek to attract (Peterson 1981; Tiebout 1956). Such incentives are a primary cause for the drastic social and economic segregation within many metropolitan areas (Weiher 1991). In other work, I find that the civic consequences of this racial and economic segregation generally are not positive (Oliver 1999). For example, residents of economically homogeneous municipalities are less civically engaged than people in more heterogeneous places. These tendencies occur with racial segregation as well; as was illustrated in Table 2, people in predominantly white cities are less likely to attend board meetings or vote in local elections.

In the contemporary American metropolis, subdividing populations into smaller political units alone will not be sufficient to stimulate civic involvement because the racial and economic segregation that accompanies such fragmentation will counteract the civic virtues of smaller city size. Democratic theorists who speculate about city size in the contemporary metropolis must take into account the civic consequences of social and economic segregation. The ideal democratic city may not just be of a particular size, but of a sufficient social and economic diversity as well.

APPENDIX: CODING OF THE VARIABLES

The data in this article come from two separate sources. The variables measuring participation, political interest, mobilization, and individual demographic variables come from the 1990 Citizen Participation Study (Verba et al., 1995). The contextual variables come from the 1990 Census of Population and Housing (U.S. Bureau of the Census 1991). The coding is described below.

Dependent Variables

These variables were coded with dichotomous, yes/no responses.

Contacting Local Officials. In the past 12 months...have you initiated any contacts with an elected official on the state or local level—a governor or mayor or a member of a city or town council-or someone on the staff of such an elected official?

Attending Community Board Meetings. Have you attended a meeting of (any official local governmental board or council that deals with community problems and issues, such as a town council, a school board, a zoning board, a planning board, or the like) in the past 12 months?

Attending Voluntary Organization Meetings. (Respondents identified a voluntary organization to which they belonged.) Here is a list of things that people sometimes have to do as part of the involvement with organizations. After I read each one, please tell me whether or not you have engaged in that activity as part of your involvement with this organization. Have you (gone to a meeting)?

Mobilization. (A positive response to either of the following questions was scored as positive.) In the past 12 months, have you received any request directed to you personally asking you to contact a government official—asking you to write to or talk to a government official? and serve on community board or council?

The following variables were scored as indicated.

Voting. A five-point voting-in-local-elections scale was based on responses to the following question: In the past five years, how often have you voted in elections for local or city officials? (1 = never, 2 = rarely, 3 = sometimes, 4 = often,5 = always).

Political Interest. (The political interest variables were drawn from two questions.) Thinking about your local community, how interested are you in local community politics and local community affairs? How interested in national politics and national affairs are you? (1 = not at all interested, 2 = slightly interested, 3 = somewhat interested, 4 = very interested).

Independent Variables

Education. The six categories were: less than 8 years of schooling, 8-12 years, high school diploma, some college, college degree, and advanced degree. The coding was from 0 (less than 8 years) to 1 (advanced degree).

Income. The eight categories were: less than \$7,500 annually; \$7,500 to \$15,000; \$15,000 to \$25,000; \$25,000 to \$35,000; \$35,000 to \$50,000; \$50,000 to \$75,000; \$75,000 to \$125,000; more than \$125,000. The coding was from 0 (less than \$7,500) to 1 (more than \$125,000).

Age. Recording from the original score of 18-92 years yielded a range from 0 (18 years old) to 1 (92 years old).

Length of Residence. 0 = less than 2 years, 1 = 2 or more years.

South. 0 = live outside South; 1 = live in Arkansas, Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, or Virginia.

Contextual Variables

City Size. The ten categories were: less than 2,500; 2,500 to 5,000; 5,000 to 10,000; 10,000 to 25,000; 25,000 to 50,000; 50,000 to 100,000; 100,000 to 250,000; 250,000 to 500,000; 500,000 to one million; more than one million. Size was recorded on a 0-1 scale.

Median Household Income. Rounded and originally coded on a 50-point scale (0 = <\$10,000; 1 = \$11,000; ... 49 = more than \$59,000), the recoding ranged from 0 (less than \$10,000) to 1 (more than \$59,000).

Percentage Black. Recoding from 0 to 97 yielded 0 (0% black) to 1 (97% black).

Rural. Residence in rural area = 1, in metropolitan area = 0.

Small Metropolitan Area. Metropolitan area with population of less than one million = 1, more than one million = 0.

In Defense of Unanimous Jury Verdicts: Mistrials, Communication, and Strategic Voting

PETER J. COUGHLAN Harvard University

The requirement of unanimous jury verdicts in criminal trials is widely believed to reduce the likelihood of convicting the innocent. This belief depends largely upon the assumption that jurors will vote nonstrategically based on their impression of the trial evidence. Recent literature, however, has questioned this assumption, and Feddersen and Pesendorfer propose a model in which it is never a Nash equilibrium for jurors to vote nonstrategically under unanimity rule, and equilibrium behavior produces higher probabilities of both convicting the innocent and acquitting the guilty under unanimity rule than under numerous alternatives. I extend this work by incorporating two additional features of actual jury procedure: the possibility of mistrial and communication among jurors. Under each circumstance, I demonstrate that nonstrategic voting is a Nash equilibrium under fairly general conditions and that unanimity performs better than any alternative rule in minimizing probability of trial error and maximizing expected utility.

t is a widely held belief among legal theorists that the requirement of unanimous jury verdicts in criminal trials reduces the likelihood of convicting an innocent defendant. This belief is, to a large extent, dependent upon the assumption that all jurors will vote nonstrategically, that is, will not take strategic voting issues into consideration, and therefore the jury decision will depend only upon interpretation of the evidence presented at trial. Recent literature suggests, however, that this assumption may be inconsistent with Nash equilibrium behavior and thus calls into question the supposed benefits of unanimous jury verdicts.

The use of juries in criminal trials is based, at least in part, upon the belief that, when all individuals possess a common preference for selecting the "better" of two alternatives (in this case, conviction or acquittal), a group is more likely than any single individual to select the preferred option. This is the central argument behind the extensive literature based on Condorcet's Jury Theorem (Condorcet [1785] 1976; Grofman and Feld 1988; Klevorick, Rothschild, and Winship 1984; Miller 1986; and Young 1988). Analysis and extensions of this theorem have generally been statistical and take individual probabilities of correct decisions to be exogenously determined (Berg 1993; Ladha 1992, 1993, 1995). Implicit in this approach is the assumption that individuals behave in the same manner whether acting as a dictator or participating in a group decision. In the framework of juries, this is equivalent to assuming that a juror's vote depends exclusively on her own private information (and perhaps shared public information) about the trial, and does not depend upon considerations of strategic interaction within the jury.

Peter J. Coughlan is Assistant Professor of Business Administration, Harvard University, Graduate School of Business Administration, Boston, MA 02163 (peoughlan@hbs.edu).

The comments and suggestions of Jeffrey Banks, David Baron, Tim Feddersen, Richard McKelvey, Tom Palfrey, and three anonymous referees are greatly appreciated. I also thank Kim Border, Paolo Ghirardato, Jonathon Katz, Anthony Kwasmica, John Ledyard, Roberto Weber, and Simon Wilkie for their observations and suggestions during preliminary presentations at Caltech. Lastly, I am grateful to the Caltech Division of Humanities and Social Sciences for providing financial support for this research

Recently, however, Austen-Smith and Banks (1996) illustrate that such nonstrategic voting in group decisions may be inconsistent with Nash equilibrium behavior under fairly general conditions. In response, McLennan (1998) and Wit (1998) have attempted to rehabilitate the central notion of Condorcet's theorem by identifying reasonable conditions under which Nash equilibrium behavior, although it may be inconsistent with nonstrategic voting, still predicts that groups are more likely to make correct decisions than individuals.

Feddersen and Pesendorfer (1998) adapted the general framework of Austen-Smith and Banks to the specific case of jury procedures in criminal trials and derived some surprising results about unanimous jury verdicts. In their model it is never a Nash equilibrium for all jurors to vote nonstrategically under unanimity rule. Moreover, Nash equilibrium behavior will lead to higher probabilities of both convicting the innocent and acquitting the guilty under unanimity rule than under a wide variety of alternatives, including simple majority rule. They conclude that the societal objective of avoiding such jury errors may be better served by eliminating the requirement of unanimous verdicts in criminal cases.

I extend the Feddersen and Pesendorfer model with two minimal enhancements that bring it closer to actual jury procedure. In particular, I separately analyze the implications of (1) incorporating the possibility of mistrial and (2) allowing limited communication among jurors. For each of these, I identify general conditions under which nonstrategic voting is, in fact, a Nash equilibrium and demonstrate that the conclusion of the inferiority of unanimous jury verdicts does not persist. That is, when either mistrial or limited communication is introduced, it is no longer the case that unanimous jury verdicts generally produce equilibrium probabilities of convicting the innocent and acquitting the guilty that are higher than under alternative voting rules. Moreover, within the nonstrategic voting equilibria that exist under these model enhancements, unanimity rule maximizes ex ante expected utility for all jurors.

THE BASIC MODEL

I begin with the basic model of jury procedure analyzed by Feddersen and Pesendorfer (1998) and, more generally, by Austen-Smith and Banks (1996). It will serve as a point of departure and source of comparison for the new jury models I introduce.

Basic Theoretical Framework

There are n jurors who will vote to determine the fate of a defendant. The set of jurors is denoted by $N = \{1, 2, \ldots, n\}$, with an individual juror being represented by $j \in N$. There are two possible states of the world: The defendant is either guilty or innocent. I denote by G the state of the world in which the defendant is guilty and by I the state in which the defendant is innocent. The prior probability of G is given by the parameter r, and the prior probability of I is 1 - r.

Feddersen and Pesendorfer simplify the problem by assuming that the two states occur with equal probability (r = 0.5). This assumption does not constitute a significant theoretical restriction, but it does complicate interpretation of the assumptions and results. This is because, in actual practice, it is likely that the prior probability of guilt is greater than 0.5 and perhaps significantly so.

To see this, consider the very high frequency with which defendants are found guilty in criminal trials. Conviction rates in federal courts, for example, have been steadily increasing for decades, and in 1995, federal criminal juries found 82% of all defendants guilty (Vidmar et al. 1997). The frequency of guilty verdicts is also very high in state courts. In recent years, the conviction rate has averaged approximately 84% in Texas, 82% in California, 72% in New York, 67% in North Carolina, and 59% in Florida (Vidmar et al. 1997).

For both models of jury procedure introduced here, such high conviction rates would be impossible if the value of r, the prior probability of guilt, were equal to 0.5. In the first new model I introduce, for example, the ex ante probability of conviction always lies between 0.5 and the value of r for all parameter combinations. Thus, a value of r significantly higher than 0.5 may be more appropriate, at least for some jurisdictions. In the theoretical results of this article, I will therefore allow r to take on any value between 0 and 1, but I also will discuss the more simplified results that arise when r = 0.5. In the specific examples presented, I will examine the cases r = 0.5 and r = 0.8.

In the basic model, there are two possible outcomes of the jury vote: The defendant is convicted (C) or acquitted (A). Each juror can either vote for convictions.

tion or acquittal. All votes are done by secret ballot, and no abstentions are allowed. I will represent by |C| the total number of votes for conviction and by |A| the total number of votes for acquittal. In addition, $|C|_{-j}$ will denote the number of votes for conviction among all jurors other than j, or $N/\{j\}$, and $|A|_{-j}$ will denote the number of votes for acquittal among $N/\{j\}$.

A voting rule is described by a threshold \hat{k} , which is an integer between 0 and n. If $|C| \ge \hat{k}$, then the defendant is convicted; otherwise, the defendant is acquitted. Unanimity rule is represented by the voting rule $\hat{k} = n$, and simple majority rule is represented by the voting rule with \hat{k} equal to the smallest integer greater than n/2.

The influence of the trial evidence is represented by a private signal received by each juror. I will denote by s_i the signal received by juror j. There are two possible signals, g or i, and the signal is correlated with the true state of the world. In particular, for all j, $Prob(s_j = g|G) = Prob(s_j = i|I) = p \in (0.5, 1.0)$. Thus, p is the probability that a juror receives the "correct" signal (g in state G or g in state g, and g in state g or g in state g. I will denote by g the total number of g signals received and by g the total number of g signals received. In addition, g in denotes the number of g signals among g in g in g denotes the number of g signals among g in g in g denotes the number of g signals among g in g in

Although juror signals are drawn independently given the true state of the world, they are correlated to each other in the sense that $\operatorname{Prob}(s_j = g|s_i = g) = \operatorname{Prob}(s_j = i|s_i = i) = p^2 + (1-p)^2 > 1/2 > 2p(1-p) = \operatorname{Prob}(s_j = g|s_i = i) = \operatorname{Prob}(s_j = i|s_i = g)$. In other words, juror i's signal provides her information about juror j's signal; in particular, she believes that juror j is more likely to have a signal that matches her own than one that does not.

I will denote by $\beta(k, n)$ the posterior probability that the defendant is guilty conditional on k of n guilty signals:

$$\beta(k, n) = \frac{rp^{k}(1-p)^{n-k}}{rp^{k}(1-p)^{n-k} + (1-r)p^{n-k}(1-p)^{k}}.$$

Let $u_j(O, S)$ be juror j's utility given outcome O in state S. The utility of the "correct" trial outcomes (i.e., conviction when the defendant is guilty, acquittal when innocent) are normalized such that $u_j(C, G) = u_j(A, I) = 0$. It is further assumed that the utility of the "incorrect" trial outcomes (i.e., conviction when the defendant is innocent, acquittal when guilty) are given by $u_j(C, I) = -q_j$, and $u_j(A, G) = -(1 - q_j)$, where $q_j \in (0, 1)$. Under this construction, any juror j will prefer conviction to acquittal whenever she believes the probability that the defendant is guilty is greater than q_j . In this sense, $1 - q_j$ is a measure of what j considers to be "reasonable doubt."

We should expect any juror j to have $q_j > 0.5$. To see this, recognize that the "more probable than not" standard of proof employed in most civil trials is equivalent to $q_j = 0.5$ for all $j \in N$. In contrast, the "beyond a reasonable doubt" standard used in criminal

¹ The proof of this claim about the mistrial model is included in the Appendix. I also prove in the Appendix that the high conviction rates observed cannot be supported with r=0.5 in the communication model, because the ex ante probability of conviction is always less than or equal to 0.5 in this case. For the basic model, it is difficult to develop such clear relationships between the value of r and the ex ante probability of conviction without imposing significant restrictions on the values of other parameters.

trials is a strictly higher standard of proof and therefore requires $q_j > 0.5$ for all $j \in N$. In particular, any j with $q_j < 0.5$ would prefer to convict even in some cases in which he believes the defendant is more likely innocent than guilty. It is possible that such jurors exist, but a specific purpose of the jury selection process is to eliminate candidates with such preferences. Therefore, in the examples presented here, I will usually assume that $q_j \in (0.5, 1.0)$ for all $j \in N$.

The basic model presented by Feddersen and Pesendorfer assumes common utilities for all jurors (i.e., $q_i = q_j$ for all $i, j \in N$), although this assumption may have been made purely for technical convenience. To assure the generality of results in this article, I will use individual utilities in all the analyses.

The behavior of a given j in the basic model is described by a strategy mapping, $\sigma_j:(0, 1) \times \{g, i\} \rightarrow [0, 1]$, with $\sigma_j(q_j, s_j)$ being the probability of voting to convict given utility parameter q_j and signal s_j . Using this notation, I will define two different nonstrategic voting strategies: informative voting and sincere voting.

Informative voting is defined as voting to convict whenever a guilty signal is received and voting to acquit whenever an innocent signal is received. In other words, to vote informatively is simply to "vote your signal" and thus honestly reveal your private information. The informative voting strategy for j is given by:

$$\sigma_{J}(q_{J}, s_{J}) = \begin{cases} 1 & \text{if } s_{J} = g \\ 0 & \text{if } s_{J} = i \end{cases}$$

Informative voting is not only nonstrategic but also naive, since voting only according to one's signal may be inconsistent with expected utility maximization for some jurors. Thus, I also define sincere voting. A strategy for j is considered sincere when it consists of voting for the trial outcome that maximizes her expected utility conditional on her signal (and perhaps any other revealed signals). The general form of the sincere voting strategy for j is given by:

$$\sigma_{J}(q_{J}, s_{J}) = \begin{cases} 1 \text{ if } q_{J} < \operatorname{Prob}(G) \\ 0 \text{ if } q_{J} \ge \operatorname{Prob}(G) \end{cases}$$

I will contrast these nonstrategic voting strategies with strategic voting, which I call rational voting. It consists simply of voting according to Nash equilibrium behavior. Rational voting thus requires a juror to vote for the trial outcome that maximizes her expected utility conditional on her signal and conditional on her vote being pivotal (i.e., her vote can change the trial outcome). A rational juror must vote as if her vote is pivotal because this is the only case in which her vote will ever affect her utility. In the basic model, rational voting thus means voting as if exactly k-1 other jurors are voting to convict.

For a given voting rule, there may be conditions under which rational voting is equivalent to informative and/or sincere voting, but it may also be the case that these voting strategies do *not* coincide. One important result to recognize, however, is that whenever rational voting is equivalent to informative voting (i.e., whenever there exists a Nash equilibrium in which all

jurors "vote their signal"), sincere voting will also be rational.

Assumptions and Conclusions of the Basic Model

Feddersen and Pesendorfer make several assumptions to eliminate potential equilibria that do not satisfy certain normative criteria. In particular, they do not consider asymmetric equilibria and equilibria in which a juror's strategy is independent of the signal received. Also, certain restrictions are placed upon the relationship between the parameters p and q_j . In particular, it is assumed for all $j \in N$ that $1 - p \le q_j \le \beta(n-1,n)$. The lower bound on q_j here is not particularly restrictive, since it is generally assumed that q_j is greater than 0.5, which is greater than 1-p. The upper bound on q_j is also relatively permissive. This bound says only that, for a jury of size n > 1, n - 1 guilty signals (versus only one innocent signal) is sufficient information for all jurors to prefer conviction.

With these assumptions, Feddersen and Pesendorfer demonstrate that, under unanimity rule, there does not exist a Nash equilibrium in which all jurors vote informatively or sincerely and that there is instead a unique mixed strategy Nash equilibrium. They also identify the unique Nash equilibrium for nonunanimous voting rules and illustrate that, as the size of the jury increases toward infinity, equilibrium behavior under unanimity rule leads to higher probabilities of both convicting the innocent and acquitting the guilty than under nonunanimous voting rules. Feddersen and Pesendorfer also use the following example to demonstrate that the inferiority of unanimous jury verdicts, while primarily a limit result, can also hold for smaller juries under fairly reasonable conditions.

Example 1. Let n = 12, r = 0.5, p = 0.8, and $q_j = 0.9$ for all $j \in N$. In this scenario, the probability of each type of trial error under different voting rules is shown in Table 1. Thus, the probability of convicting an innocent defendant and the probability of acquitting a guilty defendant are both higher under unanimity rule (k = 12) than under any other majority or supermajority voting rule. In addition, the combined probability of trial error decreases as the voting rule threshold (k) is decreased, achieving a minimum under simple majority rule (k = 7).

The key to understanding these somewhat surprising results is to recognize the significant influence that being pivotal can have on juror strategies. For example, in the case of unanimity rule, conditioning on being pivotal means that each juror behaves as if all other jurors are voting to convict the defendant. It is therefore not difficult to see that, regardless of one's own signal, being pivotal provides a strong incentive to vote for conviction in this case, since all other jurors are doing the same. For nonunanimous rules, being pivotal may provide much less compelling information. Under simple majority rule (with n odd), for example, being pivotal means only that an equal number of the other

Voting Rule (k)	7	8	9	10	11	12
Probability an innocent defendant is convicted	0.0040	0.0011	0.0025	0.0045	0.0066	0.0069
Probability a gulity defendant is acquitted	0.0190	0.0660	0.1350	0.2450	0.4200	0.6540
Combined probability of trial error	0.0115	0.0336	0.0688	0.1248	0.2133	0.3305

jurors are voting in each direction. This information is not overwhelming for either guilt or innocence and therefore can be expected to have much less influence on juror voting.

To see why informative voting is not a Nash equilibrium under unanimity rule, suppose that all jurors vote informatively and consider the situation in which i receives an innocent signal $(s_i = i)$. It is easy to see that j has a positive incentive to deviate from informative voting and instead vote to convict. Since i will condition his vote on being pivotal, he will behave as if all other jurors are voting to convict. When jurors vote informatively, this means that all other n-1 jurors received guilty signals and that j received the only innocent signal. The probability of guilt perceived by jis therefore $\beta(n-1, n)$ in this case. By assumption, however, $q_i \leq \beta(n-1, n)$, and thus j prefers conviction to acquittal. Hence, j has an incentive to vote contrary to his own signal, and therefore informative voting is not a Nash equilibrium under unanimity rule in the basic model.

THE MISTRIAL MODEL

The first significant limitation of the basic model involves the delineation of trial outcomes. The model assumes only two possible outcomes of the jury process: conviction or acquittal. Under unanimity rule, for example, a defendant is convicted if and only if all jurors vote for conviction; otherwise, the defendant is acquitted. In actual practice, however, almost all jurisdictions require unanimity for either conviction or acquittal in a criminal trial (Schwartz and Schwartz 1992). Without a unanimous vote, there is a hung jury. If the hung jury situation persists through deliberations, a mistrial is declared, and a new trial can be expected to take place. If the jury process is represented by a single vote, then any nonunanimous vote will immediately result in a mistrial.

Informative and Sincere Equilibria with Exogenous Mistrial Utilities

Consider an enhancement to the basic model in which there are three possible outcomes of the jury process: conviction (C), acquittal (A), or mistrial (M). A voting rule is still described by an integer threshold \hat{k} . If $|C| \ge \hat{k}$, then the defendant is convicted; if $|A| \ge \hat{k}$, then the defendant is acquitted; otherwise, a mistrial is de-

clared. Note that \hat{k} must again be less than or equal to n but must now also be strictly greater than (n+1)/2. This lower bound on \hat{k} exists in the mistrial model because if $\hat{k} \leq (n+1)/2$, then the trial outcome may be indeterminate in some cases or a mistrial may be an impossibility (which occurs when n is odd and $\hat{k} = (n+1)/2$).

Let $u_j(M, G) = -m_j^G$ and $u_j(M, I) = -m_j^I$. I will assume that the utility of a mistrial is strictly between the utilities of acquittal and conviction. That is, $0 < m_j^I < q_j$, and $0 < m_j^G < (1 - q_j)$. In the next section, I will endogenize these mistrial utilities by equating them with the expected value of a new trial in a repeated trial process. For now, however, it is instructive to consider these mistrial utilities as exogenously determined.

It should be noted that Schwartz and Schwartz (1992) also analyzed the effect of alternative voting rules within a model of jury procedure that allows for the possibility of mistrial. This model, however, takes a very different approach: Jurors have single-peaked preferences over a range of possible charges, and the key choice variable is the prosecutorial decision about which charge (or charges) to prosecute.

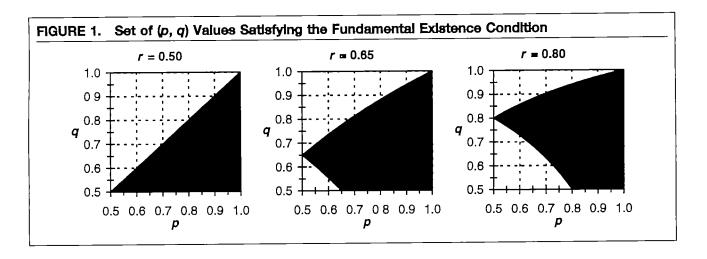

The first result in the analysis of my mistrial model presents the necessary and sufficient conditions for informative voting to be a Nash equilibrium.

PROPOSITION 1. Informative voting is a Nash equilibrium in the mistrial model if and only if, for all jurors $j \in N$, we have:

$$\begin{split} \frac{r}{1-r} \cdot \frac{1-p}{p} \\ \leq \frac{(q_j - m_j^I)(1-p)^{2\hat{k}-n-1} + m_j^I p^{2\hat{k}-n-1}}{(1-q_j - m_j^G)(1-p)^{2\hat{k}-n-1} + m_j^G p^{2\hat{k}-n-1}} \\ \leq \frac{r}{1-r} \cdot \frac{p}{1-p}. \end{split}$$

Proof. See Appendix.

It is difficult to assess immediately the generality of proposition 1 due to the complexity of the existence condition. Nonetheless, several simple observations will illustrate both the significance of the result and the generality of its scope. The first important point is that once the possibility of mistrial is added to the basic model, the conditions under which informative voting

is a Nash equilibrium become much more permissive. In particular, informative voting Nash equilibria do exist under unanimity rule in the mistrial model, which is not true for the basic model.

The complexity of the existence condition in proposition 1 is driven primarily by the generality of my formulation of the model to this point. Because I have introduced seven different variables $(k, m_l^G, m_l^I, n, p, q_l)$, and r) to characterize the jury decision process, proposition 1 must delineate the set of values for all these variables that will permit an informative voting Nash equilibrium. This approach allows proposition 1 to apply to a wide variety of trial systems and juror preferences, but it also results in a very intricate existence condition. As I will now demonstrate, once even the most simple restrictions are placed on these variables, the existence condition is greatly simplified.

For example, consider a simple restriction on the mistrial utilities, m_j^I and m_j^G . By previous assumption, $0 < m_j^I < q_j$ and $0 < m_j^G < 1 - q_j$. Suppose, then, that $m_j^I = \alpha q_j$ and $m_j^G = \alpha (1 - q_j)$ for some $\alpha \in (0, 1)$, where the precise value of α may be a function of the parameters k, n, p, q_j and r. Under this assumption, the existence condition in proposition 1 immediately reduces to:

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \leq \frac{q_j}{1-q_j} \leq \frac{r}{1-r} \cdot \frac{p}{1-p}.$$

This far simpler existence condition will reappear several times in the discussion, and I therefore refer to it as the fundamental existence condition. Because of the importance of this condition, it is helpful to discuss its interpretation.

The fundamental existence condition is equivalent to the following condition: $\beta(0, 1) \leq q_j \leq \beta(1, 1)$ for all $j \in N$. This constraint can be interpreted as a "oneman jury condition," because it is the same condition that would be required for a one-man jury (or, more appropriately, a presiding judge) to render a meaningful verdict. To see this, consider a jury that consists of a single j. If $q_j < \beta(0, 1)$, then the standard for conviction is so low that conviction is preferred even when the one and only signal is innocent; thus, all defendants will be convicted, no matter which signal is

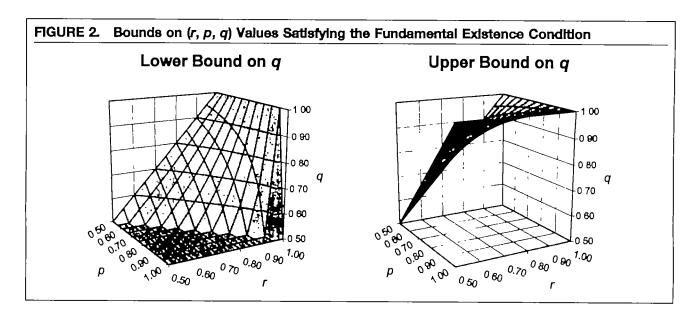

received by j. Similarly, if $q_j > \beta(1, 1)$, then the standard for conviction is so high that acquittal is preferred even when the one and only signal is guilty; thus, all defendants will be acquitted, no matter which signal is received by j. In order for this one-man jury ever to render a meaningful verdict (i.e., one that varies depending upon what actually happens at trial), it must be the case that $\beta(0, 1) \leq q_j \leq \beta(1, 1)$.

The simplifying assumption I have imposed applies only to the two mistrial utilities, but I have nonetheless reduced the number of variables in the existence condition from seven to three. With just three variables, I can now graphically illustrate the set of values that permit an informative voting Nash equilibrium in the mistrial model. The shaded areas in Figure 1 depict, for three different values of the parameter r, the set of (p, q) values that satisfy the fundamental existence condition.

Figure 1 illustrates some interesting characteristics of the fundamental existence condition. First, for a given value of p, the existence condition requires that q values not be above a certain threshold and may also require that these q values not be below another threshold. In this way, the fundamental existence condition excludes juror q values that are too extreme in either direction. As further demonstration, Figure 2 illustrates, in a three-dimensional representation, the upper and lower bounds on q imposed by the fundamental existence condition.

Second, see from figures 1 and 2 that the range of q values which satisfies the fundamental existence condition becomes larger as the value of p increases. Since p represents the probability that the true state of the world is revealed at trial, this indicates that the fundamental existence condition is more easily satisfied as the "accuracy" of trials increases.

More straightforward existence conditions are found if we instead examine conditions that are simply sufficient (but not necessary) for informative voting to be a Nash equilibrium in the mistrial model. Many different conditions will guarantee existence, but one set of sufficient conditions is the following:

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \cdot \frac{p}{1-p},$$

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \le \frac{m_j^T}{m_j^G} \le \frac{r}{1-r} \cdot \frac{p}{1-p}.$$

Note the reappearance of the fundamental existence condition as well as the presence of a similar restriction on the mistrial utilities, m_j^I and m_j^G (I no longer assume that $m_j^I = \alpha q_j$ or that $m_j^G = \alpha (1 - q_j)$). It is important to recognize, however, that many

It is important to recognize, however, that many parameter values satisfy the conditions of proposition 1 (and therefore support an informative voting Nash equilibrium) yet do not satisfy the fundamental existence condition or the easy-to-understand sufficient conditions specified above. For example, consider example 1 used by Feddersen and Pesendorfer (1998), in which n = 12, r = 0.5, p = 0.8, and $q_j = 0.9$ for all j (note that this example violates the fundamental existence condition). Under unanimity rule in this case, the existence condition of proposition 1 reduces approximately to:

$$\frac{1}{4} < \frac{m_j^I}{m_j^G} < 4.$$

This means that informative or sincere voting will be a Nash equilibrium for example 1 as long as the utility (or disutility) of one mistrial outcome is not more than four times as large as the utility (or disutility) of the other mistrial outcome. Thus, a wide range of parameter values will permit an informative voting Nash equilibrium for this example.

It is also important to recognize that any conditions sufficient for the existence of an *informative* voting Nash equilibrium, such as the condition in proposition 1 and the simpler sufficiency conditions specified above, also represent sufficient conditions for the existence of a *sincere* voting Nash equilibrium. This is true because, as discussed previously, whenever informative

voting constitutes a Nash equilibrium, sincere voting will also constitute a Nash equilibrium.

The complete proof of proposition 1 is given in the Appendix, but it is helpful to understand the basic intuition behind the result. The key element in the proof that distinguishes the predictions of the mistrial model and the basic model is the understanding of what it means to be pivotal in the two different models. To illustrate, consider the case of unanimity rule. In the basic model under unanimity rule, a juror is pivotal only when all other jurors are voting to convict. When the other jurors are voting informatively, this provides a strong incentive to vote for conviction, even for those jurors who receive an innocent signal. In the mistrial model, a juror is pivotal in two different cases: when all other jurors are voting to convict and when all other jurors are voting to acquit. Thus, the fact that a juror is pivotal in the mistrial model does not necessarily 'push" this juror toward one particular outcome (as being pivotal in the basic model pushes jurors toward conviction). Moreover, given an innocent signal in the mistrial model, a juror will believe it is more likely that all other jurors are voting to acquit than that all other jurors are voting to convict. This provides such a juror a greater incentive to vote informatively. The same is true for jurors who receive a guilty signal.

Informative and Sincere Equilibria with Endogenous Mistrial Utilities

I will endogenize the mistrial utilities, m_j^G and m_j^I , by specifying juror perceptions about the consequences of mistrial. These perceptions may incorporate many different factors, but it seems reasonable to model the utility of mistrial as simply the expected utility of an additional trial before a new jury.² In other words:

² I also could discount the expected utility of future trials or apply a fixed cost/disutility to each new trial. Mistrial utilities incorporating these factors still allow calculation of the refined necessary and

$$\begin{split} m_j^G &= (1 - q_j) \cdot \operatorname{Prob}_{\mathbf{s}}(A|G) + m_j^G \cdot \operatorname{Prob}_{\mathbf{s}}(M|G), \\ m_j^I &= q_j \cdot \operatorname{Prob}_{\mathbf{s}}(C|I) + m_j^I \cdot \operatorname{Prob}_{\mathbf{s}}(M|I), \end{split}$$

where $\operatorname{Prob}_{\bullet}(O|S)$ is the probability of outcome O in a single trial when the true state is S.

When the utility of mistrial is specified in this manner, the conditions for the existence of an informative voting Nash equilibrium are simplified significantly.

PROPOSITION 2. Suppose the utility of mistrial is equal to the expected utility of an additional trial before a new jury. Informative voting is then a Nash equilibrium in the mistrial model for any voting rule \hat{k} if and only if, for all $j \in N$, we have:

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \leq \frac{q_j}{1-q_j} \leq \frac{r}{1-r} \cdot \frac{p}{1-p}.$$

Proof. See Appendix.

With the mistrial utilities determined endogenously, the condition for existence of an informative voting Nash equilibrium reduces to the now familiar fundamental existence condition. Therefore, the set of (p, q) values that permit an informative equilibrium are illustrated by figures 1 and 2.

As with proposition 1, the inequality condition of proposition 2 represents not only a necessary and sufficient condition for the existence of an informative voting Nash equilibrium but also a sufficient condition for the existence of a sincere voting Nash equilibrium. Furthermore, proposition 2 again suggests that the occurrence of informative and sincere voting among jurors may increase as the "accuracy" of trials improves. As p increases, and thus trials become more truth revealing, the conditions of propositions 1 and 2 become easier to satisfy; hence, informative and sincere voting Nash equilibria will exist for more juries and more trials. If such nonstrategic voting is a desirable outcome, then this result provides an additional argument for legal reforms that may improve the likelihood that the true state of the world, guilt or innocence, is revealed at trial.

The significance of proposition 2 clearly depends upon its generality, so it is appropriate to ask how likely it is that the conditions of the proposition will be satisfied in practice. That is an empirical question beyond the scope of this article, but the following example demonstrates that the conditions are met quite easily.

Example 2. Consider the jury selection process for a felony trial in California. This involves choosing 12 jurors from a large set of candidates interviewed by both the prosecution and defense.

The defense has 10 peremptory challenges to dismiss candidates deemed most likely to convict. In my model, this is equivalent to dismissing candidates with the

sufficient conditions for sincere voting, but analysis of such utility structures significantly increases the complexity of the presentation without providing much additional insight.

lowest q values. Similarly, the prosecution has 10 peremptory challenges to dismiss candidates deemed least likely to convict. In my model, this is equivalent to dismissing candidates with the highest q values.

There also is an unlimited number of dismissals for cause, which the judge uses to eliminate candidates whose probability of voting for conviction is deemed either unacceptably low or unacceptably high. In my model, for example, that would mean candidates with q values below 0.5^3 or too close to 1.0. Given this process, a jury of 12 can always be chosen from a jury pool, denoted P, consisting of the first 32 candidates not dismissed for cause.

Let r = 0.8 and p = 0.8.4 In this case, an informative voting Nash equilibrium exists if and only if $0.50 \le q_j \le 0.94$ for all $j \in N$. Suppose that the distribution of q values for the candidates (not dismissed for cause) is uniform between 0.5 and 1.0. The probability that any one candidate violates the inequality above is 0.12. This gives us:

Prob(informative voting equilibrium exists)

- = Prob($\forall j \in N, 0.50 \le q_1 \le 0.94$)
- $= \text{Prob}(|\{j \in P : q_j > 0.94\}| \le 10)$

$$= \sum_{k=0}^{10} b(k, 32, 0.12) = 99.9\%.$$

In this example, the existence condition of proposition 2 is almost always satisfied.

Comparison of Alternative Voting Rules

Once the existence of nonstrategic voting Nash equilibria is established, it is important to compare the performance of alternative voting rules in terms of equilibrium outcomes. One possible performance measure is the probability of a trial error, in other words, the probability of convicting the innocent or acquitting the guilty. Proposition 3 indicates that the probability of either type of trial error decreases as k, the number of votes required for a verdict, increases.

Proposition 3. Suppose that mistrial always results in a new trial and consider two voting rules, $\hat{\mathbf{k}}_1$ and $\hat{\mathbf{k}}_2$, with $\hat{\mathbf{k}}_1 < \hat{\mathbf{k}}_2$. If jurors vote informatively, then

- (1) the probability of convicting an innocent defendant is lower under voting rule k_2 than under voting rule k_1 , and
- (2) the probability of acquitting a guilty defendant is lower under voting rule \hat{k}_2 than under voting rule \hat{k}_1 .

Proof. See Appendix.

 $[\]overline{\ }$ The "beyond a reasonable doubt" standard of proof requires that any accepted j must have $q_j>0.$

⁴ These parameter values are consistent with empirical data. I have shown that a value of r around 0.8 is to be expected; when combined with a p value of 0.8, this yields an equilibrium conviction rate of 80%, which is consistent with the conviction data cited previously.

Proposition 3 implies that the probability of trial error is uniquely minimized by unanimity rule and uniquely maximized by simple majority rule. This is in stark contrast to the conclusions drawn from the basic model, in which Nash equilibrium behavior produces a higher probability of both types of trial error under unanimity rule than under any nonunanimous voting rule.

Another reasonable measure of the performance of alternative voting rules is expected utility. My final result for the mistrial model indicates that the expected utility for any juror increases as the number of votes required for a verdict increases.

Proposition 4. Suppose that the utility of mistrial is equal to the expected utility of an additional trial before a new jury and consider two voting rules, \hat{k}_1 and \hat{k}_2 , with $\hat{k}_1 < \hat{k}_2$. If jurors vote informatively, then the ex ante expected utility for any juror is higher under voting rule \hat{k}_2 than under voting rule \hat{k}_1 .

Proof. See Appendix.

This proposition indicates that unanimity rule again performs uniquely best among all voting rules, this time in terms of maximizing expected utility. Moreover, proposition 4 also implies that simple majority rule is again the uniquely worst voting rule under this performance measure.

Propositions 3 and 4 specifically apply to the version of the mistrial model in which mistrial utilities are determined endogenously, but the results (i.e., unanimity rule minimizing error and maximizing utility) also hold true when mistrial utilities are specified exogenously. The analysis in the exogenous utility case is rather simple, however, and the appropriate interpretation of the results is less clear.

THE COMMUNICATION MODEL

The basic model effectively rules out any communication among jurors. The entire jury process is assumed to be a single vote in which each juror has no information about the beliefs of other jurors. In actual practice, the jury process involves a significant amount of communication and information revelation, and several straw votes often are taken during deliberations.

Let us now consider an enhancement to the basic model that allows for minimal communication among jurors. In particular, suppose that the jury takes a single nonbinding straw vote before taking the final binding vote for conviction or acquittal. All jurors must vote either to convict (C) or acquit (A) in both cases, and the number of preliminary votes cast for each outcome is announced prior to conducting the final vote. It is assumed that no communication other than the preliminary vote scores takes place.

This enhancement to the model is not meant to represent actual deliberation procedures; it is intended to show the significance of including communication in any model of the jury process. Even the most minimal communication (a single nonbinding straw vote) can

significantly change the conclusions of the model analysis.

Informative and Sincere Equilibria

The analysis of this communication variant of my model begins by defining a nonstrategic strategy profile appropriate for the distinctive voting framework of the model. The sincere revelation strategy profile for the communication model consists of each *j* voting according to the following guidelines.

- (1) In the preliminary vote, j votes to convict if and only if $s_i = g$ (informative voting).
- (2) In the final vote, j votes to convict if and only if $\beta(k, n) \ge q_j$, where k is the number of votes to convict from the preliminary vote (sincere voting).

The first result identifies the necessary and sufficient conditions for the sincere revelation strategy profile to constitute a subgame perfect Nash equilibrium.

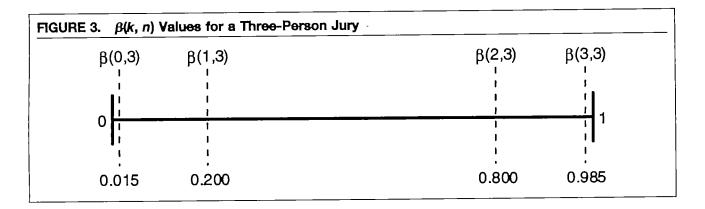

PROPOSITION 5. Let the jurors be numbered such that $q_1 \leq q_2 \leq \ldots \leq q_{n-1} \leq q_n$. The sincere revelation strategy profile is a subgame perfect Nash equilibrium for a given voting rule \hat{k} if and only if one of the following conditions is true:

- (a) $0 \le q_{\hat{k}} \le \beta(0, n)$;
- (b) $\beta(n, n) < q_k \le 1$; or
- (c) $\exists k^* \in \{1, ..., n\}$ such that $\beta(k^* 1, n) \le q_j \le \beta(k^*, n)$ for all $j \in N$.

Proof. See Appendix.

Proposition 5 states that sincere revelation is a Nash equilibrium in the communication model whenever juror utilities satisfy a certain "closeness" condition. The basic insight behind this proposition is that when juror utilities are similar enough for there to be a situation of "common interest," everyone can benefit from an honest sharing of information in the preliminary vote. Since jurors do not have competing interests, the sharing of information can only enhance the probability of achieving the outcome that all jurors prefer. In fact, the basic results of proposition 5 should hold for any game of incomplete information and common interest in which a choice must be made between two alternatives, such as between two candidates for office or two public projects.

It is important to note that the conditions in proposition 5 guarantee that the sincere revelation strategy profile will be a subgame perfect Nash equilibrium, but there will always be other equilibria in the communication model that are not informative in the preliminary vote and/or not sincere in the final vote. For example, it is always an equilibrium for jurors to vote in the preliminary vote in a way that conveys no information whatsoever about their signals and then vote according to the Nash equilibrium of the basic model in the final binding vote. There are also equilibria in which preliminary vote strategies do depend on individual signals, but jurors do not simply "vote their

signal" (they could vote directly contrary to their signal, for example).

As with the mistrial model, the significance of proposition 5 for the communication model depends to a large degree on the generality of its scope. It is therefore important to describe in more detail the different scenarios in which the existence conditions are satisfied. One simple situation that always meets the conditions of proposition 5 is the case of common utilities (i.e., when $q_i = q_j$ for all $i, j \in N$). Thus, in example 1 used by Feddersen and Pesendorfer, where $q_j = 0.9$ for all j, sincere revelation voting is a subgame perfect Nash equilibrium in the communication model under all possible voting rules.

It is possible for juror utilities to differ significantly and still satisfy the conditions of the proposition. Consider a three-person jury (n = 3), and suppose a correct signal is received 80% of the time (p = 0.8). In this case, we have $\beta(0, 3) = 0.015$, $\beta(1, 3) = 0.200$, $\beta(2, 3) = 0.800$, and $\beta(3, 3) = 0.985$, as shown in Figure 3. If all three q_j values fall between any two of the dotted lines in this figure, proposition 5 says that sincere revelation voting is a Nash equilibrium. It is thus clear that the q_j values can differ significantly yet still satisfy the condition of the proposition.

It may seem that as n increases (i.e., the size of the jury becomes larger), the difference between $\beta(k^*-1,n)$ and $\beta(k^*,n)$ will become smaller for all $k^* \in \{1,\ldots,n\}$, making the conditions of proposition 5 increasingly difficult to satisfy. This is not entirely true, however. Some of these differences remain constant (and potentially rather large) for all values of n. My next proposition uses this fact to identify sufficient conditions for the existence of a sincere voting equilibrium that are independent of jury size.

Proposition 6. For n odd, the sincere revelation strategy profile is a subgame perfect Nash equilibrium for any voting rule \hat{k} if $\forall j \in N$:

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \cdot \frac{p}{1-p}.$$

For n even, the sincere revelation strategy profile is a subgame perfect Nash equilibrium for any voting rule \hat{k} if $\forall j \in N$:

$$\frac{r}{1-r} \cdot \left(\frac{1-p}{p}\right)^2 \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \quad or$$

$$\frac{r}{1-r} \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \cdot \left(\frac{p}{1-p}\right)^2.$$

Proof. See Appendix.

The sufficiency condition for n odd in proposition 6 is precisely the fundamental existence condition discussed previously in great detail. Therefore, the set of (p, q) values sufficient for the existence of a sincere revelation equilibrium for all odd-membered juries is again illustrated by figures 1 and 2.

For a jury with an even number of members, proposition 6 presents two different conditions, each of which is independently sufficient for the existence of a sincere revelation equilibrium. These two conditions are structured very similarly to the fundamental existence condition, but they can also be rewritten to give the following sufficient conditions:

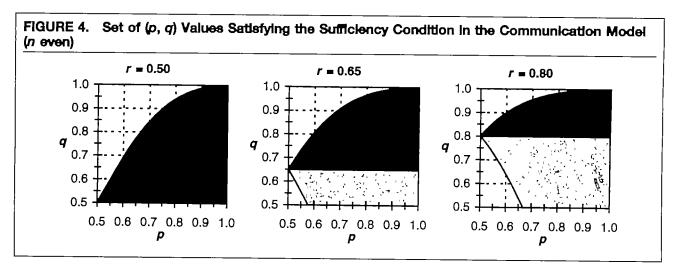

$$\frac{r(1-p)^2}{r(1-p)^2 + (1-r)p^2} \le q_j \le r \quad \text{or}$$

$$r \le q_j \le \frac{rp^2}{rp^2 + (1-r)(1-p)^2}.$$

Rewritten in this way, the conditions represent restrictions on the juror q values for given values of r and p. Figure 4 illustrates, for different values of r, the set of (p, q) values sufficient for the existence of a sincere revelation equilibrium for all even-membered juries. Note that the graphs in Figure 4 contain both a darker and a lighter shaded area, representing the two different sufficiency conditions when there is an even number of jurors.

As further illustration of these sufficiency conditions for an even-membered jury, Figure 5 provides a three-dimensional representation of the lower bound of the first sufficiency condition above (which has the straightforward upper bound $q_j \leq r$) as well as the upper bound of the second sufficiency condition above (which has the straightforward lower bound $q_i \geq r$).

To explore further the scope of the conditions in proposition 6, consider the particular case of r = 0.5

with p=0.8. Proposition 2 states that, for an odd number of jurors (whether three, eleven, or ninetynine), the sincere revelation strategy profile will be a Nash equilibrium for any voting rule whenever $0.2 \le q_j \le 0.8$ for all jurors $j \in N$. In addition, for an even number of jurors (whether four, twelve, or one hundred), the sincere revelation strategy profile will be a Nash equilibrium for any voting rule whenever all juror utilities satisfy either $0.06 \le q_j \le 0.5$ or $0.5 \le q_j \le 0.94$. This demonstrates that strategic jurors may vote sincerely in equilibrium under fairly general conditions for all juries and all voting rules.

To see the generality of proposition 6, consider the following example.

Example 3. As in example 2, consider the jury selection process for a felony trial in California. Recall that the defense has 10 peremptory challenges to dismiss candidates with the lowest q values, and the prosecution has 10 peremptory challenges to dismiss candidates with the highest q values. From a jury pool,

denoted P, consisting of the first 32 candidates (not dismissed for cause), a jury of 12 can be chosen.

Let r = 0.5 and p = 0.8. In this case, a sincere revelation Nash equilibrium exists whenever $0.50 \le q_j \le 0.94$ for all $j \in N$ (other conditions guarantee its existence as well). Again suppose that the distribution of q values for the candidates is uniform between 0.5 and 1.0. Thus, the probability that any one candidate violates the inequality above is 0.12. This gives us:

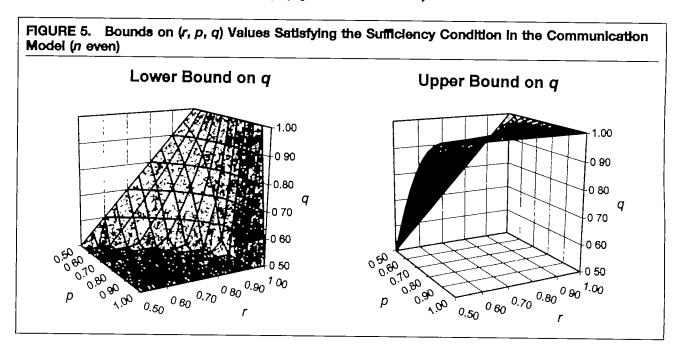

Prob(sincere revelation equilibrium exists)

$$> \text{Prob}(\forall j \in N, 0.50 \le q_j \le 0.94)$$

$$> \text{Prob}(|\{j \in P : q_j > 0.94\}| \le 10)$$

$$> \sum_{k=0}^{10} b(k, 32, 0.12) = 99.9\%.$$

In this example, the conditions of proposition 6 are almost always satisfied.

Proposition 6 suggests that the occurrence of nonstrategic voting among jurors in the communication model may increase as the "accuracy" of trials improves. The same result was observed in the analysis of the mistrial model. As p increases, and trials become more truth revealing, the conditions of proposition 6 become easier to satisfy, and sincere voting Nash equilibria will exist for more juries and more trials.

The next result for the communication model follows directly from proposition 5.

PROPOSITION 7. Suppose the juror utilities satisfy $0.5 \le q_1 \le q_2 \le ... \le q_{n-1} \le q_n$. If condition (a), (b), or (c) from proposition 5 is satisfied under voting rule \hat{k}_1 , then the same condition is satisfied under any other voting rule \hat{k}_2 satisfying $\hat{k}_2 > \hat{k}_1$.

Proof. See Appendix.

This proposition indicates that, as long as $q_j \ge 0.5$ for all j (as we would expect), sincere revelation voting is more likely to be a Nash equilibrium under unanimity rule than under any alternative voting rule.

Comparison of Alternative Voting Rules

The performance of alternative voting rules in the communication model can be evaluated by examining the probability of trial error under different rules.

Proposition 8. Suppose that the sincere revelation strategy profile is a subgame perfect Nash equilibrium for two voting rules, $\hat{\mathbf{k}}_1$ and $\hat{\mathbf{k}}_2$. If jurors behave according to this equilibrium, then

- (1) the probability of convicting an innocent defendant is the same under both voting rules, and
- (2) the probability of acquitting a guilty defendant is the same under both voting rules.

Proof. See Appendix.

Proposition 8 indicates that the sincere revelation Nash equilibrium results in the same probability of trial error under all voting rules. Thus, my conclusions once again contrast with those from the basic model, in which unanimous jury verdicts were shown to be uniquely inferior under this performance measure.

Applying the alternative criterion of expected utility maximization, my results again conflict with the negative assessment of unanimity rule from the analysis of the basic model. Instead, proposition 9 indicates that the sincere revelation Nash equilibrium in the communication model produces the same expected utility under all voting rules.

PROPOSITION 9. Suppose that the sincere revelation strategy profile is a subgame perfect Nash equilibrium for two voting rules, \hat{k}_1 and \hat{k}_2 . If jurors behave according to this Nash equilibrium, then the expected utility for any juror is the same under both voting rules.

Proof. See Appendix.

CONCLUSION

Analysis of the basic model of jury procedure developed by Feddersen and Pesendorfer produces the somewhat surprising result that sincere voting can never be a Nash equilibrium under unanimity rule. Instead, a mixed strategy equilibrium exists in which unanimous jury verdicts are uniquely inferior in terms of minimizing the probability of trial error.

The objective of this article is to evaluate the effect of certain extensions of the basic model on the existence of informative and sincere voting Nash equilibria. In particular, I examined the effects of introducing the possibility of mistrial and allowing limited communication upon the incentives for jurors to vote sincerely. In both cases, I found nontrivial conditions under which informative or sincere voting is indeed a Nash equilibrium. In addition, I compared the outcomes of these Nash equilibria under alternative voting rules and demonstrated that unanimity rule minimizes the probability of trial error and maximizes the ex ante expected utility of jurors.

An additional implication of this article is that the generality of informative and/or sincere voting equilibria is strongly dependent upon the "accuracy" of trials. In particular, as the probability that the true state of the world is revealed at trial increases, the conditions for the existence of the informative or sincere voting Nash equilibria become more general in both the mistrial model and the communication model. This provides an additional argument in support of any legal reform that can be shown to produce more accurate impressions of guilt or innocence at trial.

My focus here was the existence of pure strategy informative and sincere voting Nash equilibria, but the investigation of the effect of mistrial and communication should be extended to mixed strategy and other nonsincere Nash equilibria. In particular, it is important to determine what happens when the conditions for informative or sincere voting Nash equilibria identified here are violated. Do the equilibria that exist in such situations still produce outcomes that make unanimity rule superior in terms of minimizing error and maximizing utility? Or do the results of the basic model prevail, with unanimity being outperformed by other voting rules, such as simple majority?

A research approach for addressing these questions as well as others would be to consider an information structure in which the q values for jurors are drawn from some known distribution function and each juror otherwise knows only her own q value. The conditions for existence of nonstrategic equilibria described in this article encompass many of the parameter value combinations we might reasonably expect to observe, but this alternative approach might produce results that are even more general.

An additional important extension would be to identify the optimal jury institution by comparing alternatives that differ along several dimensions, including the number of jurors, the voting rule employed, and the presence or absence of a mistrial outcome. In order to address this issue, however, one may need to specify a

social welfare function that encompasses not only the utility of each possible trial outcome (whether right or wrong) but also the social cost of multiple trials.

APPENDIX

Proposition 1. Informative voting is a Nash equilibrium in the mistrial model if and only if, for all jurors $j \in N$, we have:

$$\begin{split} \frac{r}{1-r} \cdot \frac{1-p}{p} \leq \frac{(q_j - m_j^l)(1-p)^{2\hat{k}-n-1} + m_j^l p^{2\hat{k}-n-1}}{(1-q_j - m_j^O)(1-p)^{2\hat{k}-n-1} + m_j^O p^{2\hat{k}-n-1}} \\ \leq \frac{r}{1-r} \cdot \frac{p}{1-p} \,. \end{split}$$

Proof. Recall that a strategic voter will condition her strategy on the event that her vote is pivotal. For a given juror i, there are exactly four scenarios in which her vote is pivotal:

- (1) defendant is guilty and k-1 other jurors vote to convict $(G \cap |C|_{-,} = k - 1);$
- (2) defendant is guilty and $\hat{k} 1$ other jurors vote to acquit $(G \cap |A|_{-i} = \hat{k} - 1);$
- (3) defendant is innocent and k-1 other jurors vote to
- convict $(I \cap |C|_{-j} = k 1)$; defendant is innocent and k 1 other jurors vote to acquit $(I \cap |A|_{-j} = k 1)$.

Juror j's beliefs about the relative likelihood of each of these four scenarios will help determine her utility maximizing strategy. In particular, for any j, the expected utility of a vote to convict (ignoring the event in which the vote is not pivotal) is given by:

$$\begin{split} EU_{j}(C, s_{j}) &= \operatorname{Prob}(G \cap |C|_{-j} = \hat{k} - 1) \cdot u_{j}(C, G) \\ &+ \operatorname{Prob}(G \cap |A|_{-j} = \hat{k} - 1) \cdot u_{j}(M, G) \\ &+ \operatorname{Prob}(I \cap |C|_{-j} = \hat{k} - 1) \cdot u_{j}(C, I) \\ &+ \operatorname{Prob}(I \cap |A|_{-j} = \hat{k} - 1) \cdot u_{j}(M, I); \\ EU_{j}(C, s_{j}) &= -q_{j} \cdot \operatorname{Prob}(I \cap |C|_{-j} = \hat{k} - 1) - m_{j}^{G} \\ &\cdot \operatorname{Prob}(G \cap |A|_{-j} = \hat{k} - 1) - m_{j}^{I} \cdot \operatorname{Prob}(I \cap |A|_{-j} = \hat{k} - 1). \end{split}$$

Similarly, the expected utility of a vote to acquit is given by:

$$\begin{aligned} + \operatorname{Prob}(G \cap |\mathcal{A}|_{-j} &= \hat{k} - 1) \cdot u_{j}(A, G) \\ + \operatorname{Prob}(I \cap |\mathcal{C}|_{-j} &= \hat{k} - 1) \cdot u_{j}(M, I) \\ + \operatorname{Prob}(I \cap |\mathcal{A}|_{-j} &= \hat{k} - 1) \cdot u_{j}(A, I); \\ EU_{j}(A, s_{j}) &= -(1 - q_{j}) \cdot \operatorname{Prob}(G \cap |\mathcal{A}|_{-j} &= \hat{k} - 1) - m_{j}^{G} \end{aligned}$$

 $EU_{i}(A, s_{i}) = \operatorname{Prob}(G \cap |C|_{-i} = \hat{k} - 1) \cdot u_{i}(M, G)$

• $Prob(G \cap |C|_{-i} = \hat{k} - 1) - m_i^I \cdot Prob(I \cap |C|_{-i} = \hat{k} - 1).$ Now suppose all jurors vote informatively. That is, $\sigma_i(q_j, g) = 1$ and $\sigma_j(q_j, i) = 0$ for all j, and thus |C| = |g| and |A|

= |i|. I must show that no juror can increase his or her utility by deviating from this strategy. More specifically, for all $j \in$ N, I must show:

(1) If
$$s_j = g$$
, then $EU_j(C, g) \ge EU_j(A, g)$.
(2) If $s_j = \iota$, then $EU_j(A, i) \ge EU_j(C, i)$.

Case 1: $s_i = g$. In this case, j's belief about the probability of the first scenario in which her vote is pivotal $(G \cap |C|_{-})$ (k-1) is given by:

$$\begin{aligned} & \operatorname{Prob}(G \cap |C|_{-j} = \hat{k} - 1 | s_{j} = g) \\ & = \operatorname{Prob}(G \cap |g| = \hat{k} | s_{j} = g) \\ & = \frac{\operatorname{Prob}(G \cap |g| = \hat{k} \cap s_{j} = g)}{\operatorname{Prob}(s_{j} = g)} \\ & = \frac{\operatorname{Prob}(G) \cdot \operatorname{Prob}(|g| = \hat{k} | G) \cdot \operatorname{Prob}(s_{j} = g | |g| = \hat{k})}{\operatorname{Prob}(G) \cdot \operatorname{Prob}(s_{j} = g | G) + \operatorname{Prob}(I) \cdot \operatorname{Prob}(s_{j} = g | I)} \\ & = \frac{r \cdot \frac{n!}{k! \cdot (n - \hat{k})} \cdot p^{\hat{k}} (1 - p)^{n - \hat{k}} \cdot \frac{\hat{k}}{n}}{rp + (1 - r)(1 - p)} \\ & = \frac{(n - 1)!}{(\hat{k} - 1) \cdot (n - \hat{k})} \cdot \frac{r \cdot p^{\hat{k}} (1 - p)^{n - \hat{k}}}{rp + (1 - r)(1 - p)} \\ & = \Psi \cdot r \cdot p^{\hat{k}} (1 - p)^{n - \hat{k}}, \end{aligned}$$

where

$$\Psi = \frac{(n-1)!}{(k-1)\cdot(n-k)\cdot(rp+(1-r)(1-p))}.$$

In the same manner, I can show that:

$$Prob(G \cap |\mathcal{A}|_{-j} = \hat{k} - 1 | s_j = g) = \Psi \cdot r \cdot p^{n - \hat{k} + 1} (1 - p)^{\hat{k} - 1};$$

$$Prob(I \cap |C|_{-j} = \hat{k} - 1 | s_j = g) = \Psi \cdot (1 - r) \cdot p^{n - \hat{k}} (1 - p)^{\hat{k}};$$

$$Prob(I \cap |\mathcal{A}|_{-j} = \hat{k} - 1 | s_j = g)$$

$$= \Psi \cdot (1 - r) \cdot p^{\hat{k} - 1} (1 - p)^{n - \hat{k} + 1}.$$

Thus, the expected utility of a vote to convict is given by:

$$\begin{split} EU_{j}(C,g) &= -q_{j} \operatorname{Prob}(I \cap |C|_{-j} = \hat{k} - 1) \\ &- m_{j}^{G} \operatorname{Prob}(G \cap |A|_{-j} = \hat{k} - 1) \\ &- m_{j}^{I} \operatorname{Prob}(I \cap |A|_{-j} = \hat{k} - 1) \\ &= -q_{j} \Psi (1 - r) p^{n - \hat{k}} (1 - p)^{\hat{k}} - m_{j}^{G} \Psi r p^{n - \hat{k} + 1} (1 - p)^{\hat{k} - 1} \\ &- m_{j}^{I} \Psi (1 - r) p^{\hat{k} - 1} (1 - p)^{n - \hat{k} + 1} \\ &= -\Psi p^{n - \hat{k}} (1 - p)^{n - \hat{k}} [q_{j} (1 - r) (1 - p)^{2\hat{k} - n} \\ &+ m_{j}^{G} r p (1 - p)^{2\hat{k} - n - 1} + m_{j}^{I} (1 - r) p^{2\hat{k} - n - 1} (1 - p)], \end{split}$$

Similarly, the expected utility of a vote to acquit is given by:

$$EU_{j}(A, g) = -(1 - q_{j})\operatorname{Prob}(G \cap |A|_{-j} = \hat{k} - 1)$$

$$- m_{j}^{G} \operatorname{Prob}(G \cap |C|_{-j} = \hat{k} - 1)$$

$$- m_{j}^{I} \operatorname{Prob}(I \cap |C|_{-j} = \hat{k} - 1)$$

$$= -(1 - q_{j})\Psi r p^{n-\hat{k}+1} (1 - p)^{\hat{k}-1} - m_{j}^{G} \Psi r p^{\hat{k}} (1 - p)^{n-\hat{k}}$$

$$- m_{j}^{I} \Psi (1 - r) p^{n-\hat{k}} (1 - p)^{\hat{k}}$$

$$= -\Psi p^{n-\hat{k}} (1 - p)^{n-\hat{k}} [(1 - q_{j}) r p (1 - p)^{2\hat{k}-n-1}$$

$$+ m_{j}^{G} r p^{2\hat{k}-n} + m_{j}^{I} (1 - r) (1 - p)^{2\hat{k}-n}].$$

I now show that the second inequality in proposition 1 holds if and only if $EU_t(C, g) \ge EU_t(A, g)$:

$$\frac{(q_j - m_j^I)(1 - p)^{2\hat{k} - n - 1} + m_j^I p^{2\hat{k} - n - 1}}{(1 - q_j - m_j^O)(1 - p)^{2\hat{k} - n - 1} + m_j^O p^{2\hat{k} - n - 1}} \le \frac{r}{1 - r} \cdot \frac{p}{1 - p}$$

$$\Leftrightarrow (1 - q_{j} - m_{j}^{O})rp(1 - p)^{2\hat{k} - n - 1} + m_{j}^{O}rp^{2\hat{k} - n}$$

$$\geq (q_{j} - m_{j}^{I})(1 - r)(1 - p)^{2\hat{k} - n} + m_{j}^{I}p^{2\hat{k} - n - 1}(1 - p)$$

$$\Leftrightarrow (1 - q_{j})rp(1 - p)^{2\hat{k} - n - 1} + m_{j}^{O}rp^{2\hat{k} - n}$$

$$+ m_{j}^{I}(1 - r)(1 - p)^{2\hat{k} - n} \geq q_{j}(1 - r)(1 - p)^{2\hat{k} - n}$$

$$+ m_{j}^{O}rp(1 - p)^{2\hat{k} - n - 1} + m_{j}^{I}p^{2\hat{k} - n - 1}(1 - p)$$

$$\Leftrightarrow -\Psi p^{n - \hat{k}}(1 - p)^{n - \hat{k}}[q_{j}(1 - r)(1 - p)^{2\hat{k} - n}$$

$$+ m_{j}^{O}rp(1 - p)^{2\hat{k} - n - 1} + m_{j}^{I}p^{2\hat{k} - n - 1}(1 - p)]$$

$$\geq -\Psi p^{n - \hat{k}}(1 - p)^{n - \hat{k}}[(1 - q_{j})rp(1 - p)^{2\hat{k} - n - 1}$$

$$+ m_{j}^{O}rp^{2\hat{k} - n} + m_{j}^{I}(1 - r)(1 - p)^{2\hat{k} - n}]$$

$$\Leftrightarrow EU_{j}(C, g) \geq EU_{j}(A, g).$$

Case 2: $s_j = i$. For this case, I can calculate j's beliefs about the relative probabilities of the four scenarios in which her vote is pivotal in the same manner as above. This gives:

$$\begin{aligned} \operatorname{Prob}(G \cap |C|_{-j} = \hat{k} - 1 | \mathbf{s}_j = i) &= \Phi r p^{\hat{k} - 1} (1 - p)^{n - \hat{k} + 1}; \\ \operatorname{Prob}(G \cap |A|_{-j} = \hat{k} - 1 | \mathbf{s}_j = i) &= \Phi r p^{n - \hat{k}} (1 - p)^{\hat{k}}; \\ \operatorname{Prob}(I \cap |C|_{-j} = \hat{k} - 1 | \mathbf{s}_j = i) &= \Phi (1 - r) p^{n - \hat{k} + 1} (1 - p)^{\hat{k} - 1}; \\ \operatorname{Prob}(I \cap |A|_{-j} = \hat{k} - 1 | \mathbf{s}_j = i) &= \Phi (1 - r) p^{\hat{k}} (1 - p)^{n - \hat{k}}, \end{aligned}$$
where

$$\Phi = \frac{(n-1)!}{(k-1)\cdot(n-k)\cdot(r(1-p)+(1-r)p)}$$

Thus, the expected utility of a vote to convict is given by:

$$\begin{split} EU_{j}(C, i) &= -q_{j} \operatorname{Prob}(I \cap |C|_{\neg j} = \hat{k} - 1) \\ &- m_{j}^{G} \operatorname{Prob}(G \cap |A|_{\neg j} = \hat{k} - 1) \\ &- m_{j}^{I} \operatorname{Prob}(I \cap |A|_{\neg j} = \hat{k} - 1) \\ &= -q_{j} \Phi (1 - r) p^{n - \hat{k} + 1} (1 - p)^{\hat{k} - 1} - m_{j}^{G} \Phi r p^{n - \hat{k}} (1 - p)^{\hat{k}} \\ &- m_{j}^{I} \Phi (1 - r) p^{\hat{k}} (1 - p)^{n - \hat{k}} \\ &= -\Phi p^{n - \hat{k}} (1 - p)^{n - \hat{k}} [q_{j} (1 - r) p (1 - p)^{2\hat{k} - n - 1} \\ &+ m_{j}^{G} r (1 - p)^{2\hat{k} - n} + m_{j}^{I} (1 - r) p^{2\hat{k} - n}]. \end{split}$$

Similarly, the expected utility of a vote to acquit is given by:

$$\begin{split} EU_{j}(A, i) &= -(1 - q_{j}) \operatorname{Prob}(G \cap |A|_{-j} = \hat{k} - 1) \\ &- m_{j}^{G} \operatorname{Prob}(G \cap |C|_{-j} = \hat{k} - 1) \\ &- m_{j}^{I} \operatorname{Prob}(I \cap |C|_{-j} = \hat{k} - 1) \\ &= -(1 - q_{j}) \Phi r p^{n - \hat{k}} (1 - p)^{\hat{k}} - m_{j}^{G} \Phi r p^{\hat{k} - 1} (1 - p)^{n - \hat{k} + 1} \\ &- m_{j}^{I} \Phi (1 - r) p^{n - \hat{k} + 1} (1 - p)^{\hat{k} - 1} \\ &= - \Phi p^{n - \hat{k}} (1 - p)^{n - \hat{k}} [(1 - q_{j}) r (1 - p)^{2\hat{k} - n} \\ &+ m_{j}^{G} r p^{2\hat{k} - n - 1} (1 - p) \\ &+ m_{j}^{I} (1 - r) p (1 - p)^{2\hat{k} - n - 1}]. \end{split}$$

We now show that the first inequality in proposition 1 holds if and only if $EU_r(A, i) \ge EU_r(C, i)$:

$$\begin{split} \frac{r}{1-r} \cdot \frac{1-p}{p} &\leq \frac{(q_{J}-m_{J}^{I})(1-p)^{2\hat{k}-n-1} + m_{J}^{I}p^{2\hat{k}-n-1}}{(1-q_{J}-m_{J}^{O})(1-p)^{2\hat{k}-n-1} + m_{J}^{I}p^{2\hat{k}-n-1}} \\ \Leftrightarrow (q_{J}-m_{J}^{I})(1-r)p(1-p)^{2\hat{k}-n-1} + m_{J}^{I}p^{2\hat{k}-n} \\ &\geq (1-q_{J}-m_{J}^{O})r(1-p)^{2\hat{k}-n} + m_{J}^{O}rp^{2\hat{k}-n-1}(1-p) \\ \Leftrightarrow q_{J}(1-r)p(1-p)^{2\hat{k}-n-1} + m_{J}^{O}r(1-p)^{2\hat{k}-n} \\ &+ m_{J}^{I}(1-r)p^{2\hat{k}-n} \geq (1-q_{J})r(1-p)^{2\hat{k}-n} \\ &+ m_{J}^{O}rp^{2\hat{k}-n-1}(1-p) + m_{J}^{I}(1-r)p(1-p)^{2\hat{k}-n-1} \\ \Leftrightarrow -\Phi p^{n-\hat{k}}(1-p)^{n-\hat{k}}[(1-q_{J})r(1-p)^{2\hat{k}-n} \\ &+ m_{J}^{O}rp^{2\hat{k}-n-1}(1-p) + m_{J}^{I}(1-r)p(1-p)^{2\hat{k}-n-1}] \\ \geq -\Phi p^{n-\hat{k}}(1-p)^{n-\hat{k}}[q_{J}(1-r)p(1-p)^{2\hat{k}-n-1}] \\ \Leftrightarrow EU_{J}(A,i) \geq EU_{J}(C,i). \qquad Q.E.D. \end{split}$$

PROPOSITION 2. Suppose the utility of mistrial is equal to the expected utility of an additional trial before a new jury. Informative voting is then a Nash equilibrium in the mistrial model for any voting rule \hat{k} if and only if, for all $j \in N$, we have:

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \le \frac{q_1}{1-q_1} \le \frac{r}{1-r} \cdot \frac{p}{1-p}.$$

Proof. First note that, in a single trial, we have:

$$\operatorname{Prob}_{s}(C|I) = \operatorname{Prob}_{s}(A|G) = \sum_{x=k}^{n} \binom{n}{x} p^{n-x} (1-p)^{x};$$

$$\operatorname{Prob}_{s}(M|I) = \operatorname{Prob}_{s}(M|G) = \sum_{x=-k+1}^{k-1} \binom{n}{x} p^{n-x} (1-p)^{x}.$$

This gives us:

$$\begin{split} m_j^G &= (1 - q_j) \cdot \operatorname{Prob}_s(A|G) + m_j^G \cdot \operatorname{Prob}_s(M|G); \\ m_j^G &= (1 - q_j) \sum_{x = \hat{k}}^n \binom{n}{x} p^{n-x} (1 - p)^x \\ &+ m_j^G \sum_{x = n - \hat{k} + 1}^{\hat{k} - 1} \binom{n}{x} p^{n-x} (1 - p)^x; \end{split}$$

$$m_{j}^{G} = \frac{(1 - q_{j}) \sum_{x=k}^{n} {n \choose x} p^{n-x} (1 - p)^{x}}{1 - \sum_{x=n-k+1}^{k-1} {n \choose x} p^{n-x} (1 - p)^{x}};$$

$$m_{j}^{G} = (1 - q_{j}) \cdot \Omega,$$

where
$$\Omega = \frac{\sum_{x=k}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{1 - \sum_{x=n-k+1}^{k-1} \binom{n}{x} p^{n-x} (1-p)^{x}} \ge 0.$$

Similarly, I can show that: $m_i^I = q_i \cdot \Omega$.

Thus, the condition in proposition 1 becomes:

$$\begin{split} &\frac{r}{1-r} \cdot \frac{1-p}{p} \\ &\leq \frac{(q_j - q_j \Omega)(1-p)^{2\hat{k}-n-1} + q_j \Omega p^{2\hat{k}-n-1}}{(1-q_j - (1-q_j)\Omega)(1-p)^{2\hat{k}-n-1} + (1-q_j)\Omega p^{2\hat{k}-n-1}} \\ &\leq \frac{r}{1-r} \cdot \frac{p}{1-p} \\ &\frac{r}{1-r} \cdot \frac{1-p}{p} \\ &\leq \frac{q_j((1-\Omega)(1-p)^{2\hat{k}-n-1} + \Omega p^{2\hat{k}-n-1})}{(1-q_j)((1-\Omega)(1-p)^{2\hat{k}-n-1} + \Omega p^{2\hat{k}-n-1})} \\ &\leq \frac{r}{1-r} \cdot \frac{p}{1-p} \\ &\frac{r}{1-r} \cdot \frac{1-p}{p} \leq \frac{q_j}{1-q_j} \leq \frac{r}{1-r} \cdot \frac{p}{1-p}. \quad \textit{Q.E.D.} \end{split}$$

PROPOSITION 3. Suppose that mustrial always results in a new trial and consider two voting rules, $\hat{\mathbf{k}}_1$ and $\hat{\mathbf{k}}_2$, with $\hat{\mathbf{k}}_1 < \hat{\mathbf{k}}_2$. If jurors vote informatively, then

- the probability of convicting an innocent defendant is lower under voting rule k

 ₂ than under voting rule k

 ₁; and
- the probability of acquitting a guilty defendant is lower under voting rule k₂ than under voting rule k₁.

Proof. First note that, due to the symmetry of the mistrial model, the probability of convicting an innocent defendant is equal to the probability of acquitting a guilty defendant. Therefore, it is sufficient to prove only part (1) of the proposition.

In addition, note that it is sufficient to prove only that the probability of convicting an innocent defendant is lower under voting rule $k_1 + 1$ than under voting rule k_2 . It is then obvious by induction that, for any voting rule k_2 with $k_1 < k_2$, the probability of convicting an innocent defendant is lower under k_2 than k_1 .

The probability of convicting an innocent defendant in (possibly) repeated trials under voting rule k_1 is given by:

$$\operatorname{Prob}_{R}^{\hat{k}_{1}}(C|I) = \sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{n-x} (1-p)^{x} \\ + \operatorname{Prob}_{R}^{\hat{k}_{1}}(C|I) \cdot \sum_{x=n-\hat{k}_{1}+1}^{\hat{k}_{1}-1} \binom{n}{x} p^{n-x} (1-p)^{x};$$

$$\operatorname{Prob}_{R}^{\hat{k}_{1}}(C|I) = \frac{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{x-x} (1-p)^{x}}{1 - \sum_{x=n-\hat{k}_{1}+1}^{n} \binom{n}{x} p^{x-x} (1-p)^{x}};$$

$$\operatorname{Prob}_{R}^{\hat{k}_{1}}(C|I) = \frac{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{x-x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{x-x} (1-p)^{x}};$$

$$\operatorname{Prob}_{R}^{\hat{k}_{1}}(C|I) = \frac{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{x-x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{x-x} (1-p)^{x}};$$

$$\operatorname{Prob}_{R}^{k_{1}}(C|I) = \frac{\sum_{x=k_{1}}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{\sum_{x=k_{1}}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})}$$

Similarly, the probability of convicting an innocent defendant in possibly repeated trials under voting rule $k_1 + 1$ is given by:

$$\operatorname{Prob}_{R}^{\hat{k}_{1}+1}(C|I) = \frac{\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})}.$$

I now show that $\operatorname{Prob}_{R}^{\mathbf{\ell}_{1}}(C|I) > \operatorname{Prob}_{R}^{\mathbf{\ell}_{1}}+1(C|I)$:

$$p^{\hat{k}_1-x}(1-p)^{x-\hat{k}_1} < p^{x-\hat{k}_1}(1-p)^{\hat{k}_1-x}$$

for any
$$x > k_1$$
 (recall $p < 1 - p$);

$$\binom{n}{x} p^{n+\hat{k}_1-x} (1-p)^{n+x-\hat{k}_1} < \binom{n}{x} p^{n+x-\hat{k}_1} (1-p)^{n+\hat{k}_1-x}$$

for any $x > k_1$;

$$\sum_{x=\hat{k}_1+1}^n \binom{n}{x} p^{n+\hat{k}_1-x} (1-p)^{n+x-\hat{k}_1} < \sum_{x=\hat{k}_1+1}^n \binom{n}{x} p^{n+x-\hat{k}_1} (1-p)^{n+\hat{k}_1-x};$$

$$p^{\hat{k}_1}(1-p)^{n-\hat{k}_1} \sum_{r=\hat{k}_1+1}^{n} \binom{n}{x} p^{n-r} (1-p)^r$$

$$< p^{n-\hat{k}_1} (1-p)^{\hat{k}_1} \sum_{x=\hat{k}+1}^{n} {n \choose x} p^x (1-p)^{n-x};$$

$$(p^{n-\hat{k}_1}(1-p)^{\hat{k}_1}+p^{\hat{k}_1}(1-p)^{n-\hat{k}_1})\sum_{x=\hat{k}_1+1}^{n} \binom{n}{x} p^{n-x}(1-p)^x$$

$$< p^{n-\hat{k}_1} (1-p)^{\hat{k}_1} \sum_{x=\hat{k}_1+1}^n {n \choose x} (p^{n-x} (1-p)^x + p^x (1-p)^{n-x});$$

$$\left(p^{n-\hat{k}_1}(1-p)^{\hat{k}_1}+p^{\hat{k}_1}(1-p)^{n-\hat{k}_1}+\sum_{x=\hat{k}_1+1}^n \binom{n}{x}(p^{n-x}(1-p)^x\right)$$

$$+p^{x}(1-p)^{n-x}$$
) $\sum_{x=\hat{k}_{1}+1}^{n} {n \choose x} p^{n-x}(1-p)^{x}$

$$<\left(p^{n-\hat{k}_1}(1-p)^{\hat{k}_1}+\sum_{x=\hat{k}_1+1}^n\binom{n}{x}p^{n-x}(1-p)^x\right).$$

$$\sum_{x=x_{1}+1}^{n} {n \choose x} (p^{n-x}(1-p)^{x} + p^{x}(1-p)^{n-x});$$

$$\sum_{x=1}^{n} {n \choose x} (p^{n-x}(1-p)^{x} + p^{x}(1-p)^{n-x}) \cdot \sum_{x=1}^{n} {n \choose x} p^{n-x}(1-p)^{x}$$

$$< \sum_{x=\hat{k}_{1}}^{n} {n \choose x} p^{n-x} (1-p)^{x} \cdot \sum_{x=\hat{k}_{1}+1}^{n} {n \choose x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x});$$

$$\frac{\sum_{x=\hat{k}_{1}+1}^{n} {n \choose x} p^{n-x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}+1}^{n} {n \choose x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})}$$

$$< \frac{\sum_{x=\hat{k}_{1}+1}^{n} {n \choose x} p^{n-x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}}^{n} {n \choose x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})};$$

$$Prob_{p}^{\hat{k}_{1}+1}(C|I) < Prob_{p}^{\hat{k}_{1}}(C|I).$$

By induction, we have $\operatorname{Prob}_R^{k_1}(C|I) > \operatorname{Prob}_R^{k_2}(C|I)$ where $k_1 < k_2$, and since $\operatorname{Prob}_R(A|G) = \operatorname{Prob}_R(C|I)$, we also have that $\operatorname{Prob}_R^{k_1}(A|G) > \operatorname{Prob}_R^{k_2}(A|G)$. Q.E.D.

Proposition 4. Suppose that the utility of mustrial is equal to the expected utility of an additional trial before a new jury and consider two voting rules, $\hat{\mathbf{k}}_1$ and $\hat{\mathbf{k}}_2$, with $\hat{\mathbf{k}}_1 < \hat{\mathbf{k}}_2$. If jurors vote informatively, then the ex ante expected utility for an juror is higher under voting rule $\hat{\mathbf{k}}_2$ than under voting rule $\hat{\mathbf{k}}_1$.

Proof. Note that it is sufficient to prove only that the ex ante expected utility is higher under voting rule $k_1 + 1$ than under voting rule k_1 . It is then obvious by induction that, for any voting rule k_2 with $k_1 < k_2$, the expected utility is higher under k_2 than under k_1 .

If all jurors vote sincerely, then the ex ante expected utility for j under voting rule k_1 when the defendant is guilty is given by:

$$EU_{j}(\hat{k}_{1}|G) = -(1 - q_{j})\operatorname{Prob}_{s}^{\hat{k}_{1}}(A|G) + EU_{j}(\hat{k}_{1}|G)\operatorname{Prob}_{s}^{\hat{k}_{1}}(M|G);$$

$$EU_{j}(\hat{k}_{1}|G) = \frac{-(1 - q_{j})\operatorname{Prob}_{s}^{\hat{k}_{1}}(A|G)}{1 - \operatorname{Prob}_{s}^{\hat{k}_{1}}(M|G)};$$

$$EU_{j}(\hat{k}_{1}|G) = \frac{-(1 - q_{j})\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x}p^{n-x}(1 - p)^{x}}{1 - \sum_{\hat{s}=1}^{n} \binom{n}{x}p^{n-x}(1 - p)^{x}}.$$

Similarly, I can show that the ex ante expected utility for j under voting rule k_1 when the defendant is innocent is given by:

$$EU_{j}(\hat{k}_{1}|I) = \frac{-q_{j}\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x}p^{n-x}(1-p)^{x}}{1-\sum_{x=-\hat{k}_{1}+1}^{\hat{k}_{1}-1} \binom{n}{x}p^{n-x}(1-p)^{x}}.$$

Thus, the overall ex ante expected utility for j under voting rule k_1 is given by:

$$EU_{j}(\hat{k}_{1}) = \operatorname{Prob}(G) \cdot \frac{-(1-q_{j}) \sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{1 - \sum_{x=n-\hat{k}_{1}+1}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}$$

$$+ \operatorname{Prob}(I) \cdot \frac{-q_{j} \sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{1 - \sum_{x=n-\hat{k}_{1}+1}^{\hat{k}_{1}-1} \binom{n}{x} p^{n-x} (1-p)^{x}}$$

$$= -(r(1-q_{j}) + (1-r)q_{j})$$

$$\cdot \frac{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{1 - \sum_{x=n-\hat{k}_{1}+1}^{\hat{k}_{1}-1} \binom{n}{x} p^{n-x} (1-p)^{x}}.$$

$$1 - \sum_{x=n-\hat{k}_{1}+1}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}$$

Similarly, the overall ex ante expected utility for j under voting rule $k_1 + 1$ is given by:

$$EU_{i}(\mathbf{k}_{1}+1)=(-r(1-q_{i})-(1-r)q_{i})$$

$$\cdot \frac{\sum_{x=\hat{k}_1+1}^{n} {n \choose x} p^{n-x} (1-p)^x}{1-\sum_{x=n-\hat{k}_1}^{\hat{k}_1} {n \choose x} p^{n-x} (1-p)^x}.$$

I now show that $EU_{i}(\hat{k}_{1}+1) > EU_{i}(\hat{k}_{1})$:

$$\sum_{x=\hat{k}_1+1}^{n} {n \choose x} p^{n+\hat{k}_1-x} (1-p)^{n+x-\hat{k}_1} < \sum_{x=\hat{k}_1+1}^{n} {n \choose x} p^{n+x-\hat{k}_1} (1-p)^{n+\hat{k}_1-x}$$

(from proof of proposition 3);

$$\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{2n-\hat{k}_{1}-x}(1-p)^{\hat{k}_{1}+x} + p^{n+\hat{k}_{1}-x}(1-p)^{n+x-\hat{k}_{1}})$$

$$< \sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{2n-\hat{k}_{1}-x}(1-p)^{\hat{k}_{1}+x} + p^{n+x-\hat{k}_{1}}(1-p)^{n+\hat{k}_{1}-x});$$

$$\binom{n}{\hat{k}_{1}} (p^{n-\hat{k}_{1}}(1-p)^{\hat{k}_{1}} + p^{\hat{k}_{1}}(1-p)^{n-\hat{k}_{1}}) \sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} p^{n-x}(1-p)^{x}$$

$$< \binom{n}{\hat{k}_{1}} p^{n-\hat{k}_{1}}(1-p)^{\hat{k}_{1}} \sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{n-x}(1-p)^{x} + p^{x}(1-p)^{n-x});$$

$$\binom{n}{\hat{k}_{1}} \binom{n}{x} (p^{n-x}(1-p)^{x} + p^{x}(1-p)^{n-x})$$

$$\cdot \binom{n}{x=\hat{k}_{1}+1} \binom{n}{x} p^{n-x}(1-p)^{x}$$

$$\cdot \binom{n}{x=\hat{k}_{1}+1} \binom{n}{x} p^{n-x}(1-p)^{x}$$

$$< \left(\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} p^{n-x} (1-p)^{x} \right) \left(\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x}) \right);$$

$$\frac{\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})}$$

$$< \frac{\sum_{x=\hat{k}_{1}+1}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{x}}{\sum_{x=\hat{k}_{1}}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})};$$

$$-(r(1-q_j) + (1-r)q_j) \cdot \frac{\sum_{x=\hat{k}_1+1}^{n} \binom{n}{x} p^{n-x} (1-p)^x}{1 - \sum_{x=n-\hat{k}_1}^{\hat{k}_1} \binom{n}{x} p^{n-x} (1-p)^x}$$

$$> -(r(1-q_j) + (1-r)q_j) \cdot \frac{\sum_{x=\hat{k}_1}^{n} {n \choose x} p^{n-x} (1-p)^x}{1 - \sum_{x=n-\hat{k}_1+1}^{\hat{k}_1-1} {n \choose x} p^{n-x} (1-p)^x};$$

$$EU_{l}(\mathbf{k}_{1}+1)>EU_{l}(\mathbf{k}_{1}).$$

By induction, we have $EU_j(k_2) > EU_j(k_1)$ where $k_1 < k_2$. Q.E.D.

PROPOSITION 5. Let the jurors be numbered such that $q_1 \le q_2 \le \ldots \le q_{n-1} \le q_n$. Then the suncere revelation strategy profile is a subgame perfect Nash equilibrium for a given voting rule \hat{k} if and only if one of the following conditions is true:

- (a) $0 \le q_k \le \beta(0, n)$;
- (b) $\beta(n, n) < q_k \le 1$; or
- (c) $\exists k^* \in \{1, ..., n\}$, such that $\beta(k^* 1, n) \le q_j \le \beta(k^*, n)$ for all $j \in N$.

Proof. First recognize that a strategic voter will condition her strategies in both the preliminary and final votes on the event that her vote is pivotal; that is, her vote can change the trial outcome. In the event that her vote is *not* pivotal, her utility is unaffected by her vote, and therefore such situations have no implications for strategic behavior.

I will evaluate strategy in the final vote first and then work backward to examine the preliminary vote.

Final Vote Strategy: Assume that in the preliminary vote, $\sigma_j(g) = 1$ and $\sigma_j(t) = 0$ for all jurors $j \in N$. Further assume that all jurors $j \in N$ vote to convict in the final vote if and only if $\beta(k, n) \ge q_j$, where k is the number of votes to convict from the preliminary vote. I must show that no juror has an incentive to deviate from this strategy in the final vote.

Since all jurors vote sincerely in the preliminary vote, all will know the total number of guilty (g) and innocent (t) signals before taking the final vote. Thus, all jurors will have the same estimate of the probability that the defendant is guilty, namely, $\beta(k, n)$.

For any given j, we need only consider the situation in which his vote is pivotal. That is, if he votes to convict, the defendant will be convicted, and if he votes to acquit, the defendant will be acquitted. Thus, for any j, the expected utility of voting to acquit in this case is given by:

$$EU(A||g|=k) = -(1-q_j) \cdot \text{Prob}(G||g|=k)$$
$$= -(1-q_j) \cdot \beta(k, n).$$

Similarly, the expected utility of voting to convict is given by:

$$EU(C||g| = k) = -q_j \cdot \text{Prob}(I||g| = k)$$
$$= -q_j \cdot (1 - \beta(k, n)).$$

Therefore, j will want to vote to convict if and only if:

$$EU(C||g| = k) \ge EU(A||g| = k)$$

$$-q_j \cdot \operatorname{Prob}(I||g| = k) \ge -(1 - q_j) \cdot \operatorname{Prob}(G||g| = k)$$

$$-q_j \cdot (1 - \beta(k, n)) \ge -(1 - q_j) \cdot \beta(k, n)$$

$$q_j \cdot (1 - \beta(k, n)) \le (1 - q_j) \cdot \beta(k, n)$$

$$q_j - q_j \beta(k, n) \le \beta(k, n) - q_j \beta(k, n)$$

$$q_j \le \beta(k, n).$$

Therefore, sincere voting in the final vote is a Nash equilibrium for this subgame. This result is dependent only upon the assumption of informative voting in the preliminary vote and is independent of satisfaction or violation of conditions (a), (b), and (c).

Preliminary Vote Strategy: Now assume that all jurors $j \in N$ vote to convict in the final vote if and only if $\beta(k, n) \ge q_j$, where k is the number of votes to convict from the preliminary vote. Further assume that $\sigma_j(g) = 1$ and $\sigma_j(t) = 0$ for all jurors $j \in N$ in the preliminary vote. I must show that, if one of the conditions, (a), (b), or (c), is satisfied, then no juror has an incentive to deviate from this informative voting strategy in the preliminary vote. I also must show that, if all three conditions are violated, then at least one juror has an incentive to deviate in the preliminary vote.

Case 1: Condition (a) is satisfied. In this case, $0 \le q_1 \le \ldots \le q_k \le \beta(0, n)$. This means that, in the final vote, at least k jurors will always vote to convict, and the defendant will always be convicted regardless of the outcome of the preliminary vote. Therefore, no juror has a positive incentive to deviate from informative voting in the preliminary vote.

Case 2: Condition (b) is satisfied. In this case, $\beta(n, n) \leq q_k \leq \ldots \leq q_n \leq 1$ for all $j \in N$. This means that, in the final vote, at least n - k + 1 jurors will always vote to acquit, and the defendant will always be acquitted regardless of the outcome of the preliminary vote. Therefore, no juror has a positive incentive to deviate from informative voting in the preliminary vote.

Case 3: Condition (c) is satisfied. In this case, $\exists k^* \in \{1, \ldots, n\}$, such that $\beta(k^*-1, n) \leq q_j \leq \beta(k^*, n)$ for all $j \in N$. Thus, if juror j is pivotal in the preliminary vote, this means that $|g|_{-j} = k^* - 1$. In other words, if j votes C in the preliminary vote, all other jurors will vote C in the final vote;

if j votes A in the preliminary vote, all other jurors will vote A in the final vote.

This means that if j is pivotal in the preliminary vote, then i can completely dictate the final trial outcome through her preliminary vote. Even under unanimity rule, j's preliminary vote will determine the final vote of all other jurors, thus allowing j to choose the trial outcome with her final vote. Thus, we can say that a juror will prefer to vote C in the preliminary vote if and only if she prefers that the defendant be convicted in the final outcome, that is, $EU(C||g|_{-}) = k^*$ -1) $\geq EU(A||g|_{-i} = k^* - 1)$. Now suppose that $s_i = i$. In this case:

$$EU(C||g|_{-j} = k^* - 1) = EU(C||g| = k^* - 1)$$

$$= -q_j \cdot (1 - \beta(k^* - 1, n));$$

$$EU(A||g|_{-j} = k^* - 1) = EU(A||g| = k^* - 1)$$

$$= -(1 - q_j) \cdot \beta(k^* - 1, n);$$

$$\beta(k^* - 1, n) < q_j \Rightarrow \beta(k^* - 1, n) - q_j \cdot \beta(k^* - 1, n)$$

$$< q_j - q_j \cdot \beta(k^* - 1, n)$$

$$\Rightarrow -(1 - q_j) \cdot \beta(k^* - 1, n) > -q_j \cdot (1 - \beta(k^* - 1, n))$$

$$\Rightarrow EU(A||g|_{-j} = k^* - 1) > EU(C||g|_{-j} = k^* - 1).$$

Now suppose that $s_i = g$. In this case:

$$EU(C||g|_{-j} = k^* - 1) = EU(C||g| = k^*)$$

$$= -q_j \cdot (1 - \beta(k^*, n));$$

$$EU(A||g|_{-j} = k^* - 1) = EU(A||g| = k^*)$$

$$= -(1 - q_j) \cdot \beta(k^*, n);$$

$$\beta(k^*, n) \ge q_j \Rightarrow \beta(k^*, n) - q_j \cdot \beta(k^*, n)$$

$$\ge q_j - q_j \cdot \beta(k^*, n)$$

$$\Rightarrow (1 - q_j) \cdot \beta(k^*, n) \ge q_j \cdot (1 - \beta(k^*, n))$$

$$\Rightarrow -(1 - q_j) \cdot \beta(k^*, n) \le -q_j \cdot (1 - \beta(k^*, n))$$

$$\Rightarrow EU(A||g|_{-j} = k^* - 1) \le EU(C||g|_{-j} = k^* - 1).$$

Thus, j will prefer to vote to convict in the preliminary vote if and only if $s_1 = g$.

Case 4: Conditions (a), (b), and (c) are all violated. Violation of conditions (a) and (b) means that $\exists k^* \in \{1, ..., n\}$, such that $\beta(k^*-1, n) < q_k \le \beta(k^*, n)$. For a given j to be pivotal in the preliminary vote, it means that $|g|_{-j} = k^* - 1$. Violation of condition (c) means that $q_1 < \beta(k^*-1, n)$

and/or $\beta(k^*, n) < q_n$. Suppose $q_1 < \beta(k^* - 1, n)$, and consider the situation in which juror 1 is pivotal (i.e., $|g|_{-1} = k^* - 1$) and $s_1 = i$. If juror 1 votes A in the preliminary vote (i.e., votes sincerely), then the defendant will be acquitted, since $\beta(k^*-1, n) <$ q_k . If juror 1 instead deviates and votes C, then the defendant will be convicted, since $q_k \leq \beta(k^*, n)$. Since $q_1 < \beta(k^*, n)$ -1, n), juror 1 prefers that the defendant be convicted and

therefore has a positive incentive to deviate and vote C. Now suppose $\beta(k^*, n) < q_n$, and consider the situation in which juror n is pivotal (i.e., $|g|_{-n} = k^* - 1$) and $s_n = g$. If juror n votes C in the preliminary vote (i.e., votes sincerely), then the defendant will be convicted, since $q_k \leq \beta(k^*, n)$. If juror n instead deviates and votes A, then the defendant will be acquitted, since $\beta(k^* - 1, n) < q_k$. Since $\beta(k^*, n) < q_n$, juror n prefers that the defendant be acquitted and therefore has a positive incentive to deviate and vote A.

Thus, if conditions (a), (b), and (c) are all violated, then informative voting is not a Nash equilibrium in the preliminary vote.

Proposition 6. For n odd, the sincere revelation strategy profile is a subgame perfect Nash equilibrium for any voting rule k if

$$\frac{r}{1-r} \cdot \frac{1-p}{p} \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \cdot \frac{p}{1-p}.$$

For n even, the sincere revelation strategy profile is a subgame perfect Nash equilibrium for any voting rule \hat{k} if $\forall j \in N$:

$$\frac{r}{1-r} \cdot \left(\frac{1-p}{p}\right)^2 \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \quad or$$

$$\frac{r}{1-r} \le \frac{q_j}{1-q_j} \le \frac{r}{1-r} \cdot \left(\frac{p}{1-p}\right)^2.$$

Proof. Suppose that n is odd. Proposition 5 says that the sincere revelation strategy profile is a subgame perfect Nash equilibrium for any voting rule k if

$$\beta\left(\frac{n-1}{2}, n\right) \le q_j \le \beta\left(\frac{n+1}{2}, n\right), \ \forall j \in \mathbb{N}.$$

This condition is equivalent to:

$$\begin{split} \frac{rp^{(n-1)/2}(1-p)^{(n+1)/2}}{rp^{(n-1)/2}(1-p)^{(n+1)/2}+(1-r)p^{(n+1)/2}(1-p)^{(n-1)/2}} &\leq q_j \\ &\leq \frac{rp^{(n+1)/2}(1-p)^{(n-1)/2}}{rp^{(n+1)/2}(1-p)^{(n-1)/2}+(1-r)p^{(n-1)/2}(1-p)^{(n+1)/2}} \\ &\frac{r(1-p)}{r(1-p)+(1-r)p} \leq q_j \leq \frac{rp}{rp+(1-r)(1-p)} \\ &\frac{r}{1-r} \cdot \frac{1-p}{p} \leq \frac{q_j}{1-q_j} \leq \frac{r}{1-r} \cdot \frac{\dot{p}}{1-p} \,. \end{split}$$

Now suppose that n is even. Proposition 5 says that the sincere revelation strategy profile is a subgame perfect Nash equilibrium for any voting rule k if

$$\beta\left(\frac{n}{2}-1,n\right) \le q_j \le \beta\left(\frac{n}{2},n\right), \ \forall j \in N \quad \text{or}$$

$$\beta\left(\frac{n}{2},n\right) \le q_j \le \beta\left(\frac{n}{2}+1,n\right), \ \forall j \in N.$$

The first of these two conditions is equivalent to:

$$\begin{split} \frac{rp^{(\sqrt{r}/2)-1}(1-p)^{(\sqrt{r}/2)+1}}{rp^{(\sqrt{r}/2)-1}(1-p)^{(\sqrt{r}/2)+1}+(1-r)p^{(\sqrt{r}/2)+1}(1-p)^{(\sqrt{r}/2)-1}} &\leq q_j \\ &\leq \frac{rp^{\sqrt{r}/2}(1-p)^{\sqrt{r}/2}}{rp^{\sqrt{r}/2}(1-p)^{\sqrt{r}/2}+(1-r)p^{\sqrt{r}/2}(1-p)^{\sqrt{r}/2}} \\ &\frac{r(1-p)^2}{r(1-p)^2+(1-r)p^2} &\leq q_j \leq r \\ &\frac{r}{1-r} \cdot \left(\frac{1-p}{p}\right)^2 \leq \frac{q_j}{1-q_j} \leq \frac{r}{1-r}. \end{split}$$

The second of these two conditions is equivalent to:

$$\frac{rp^{n/2}(1-p)^{n/2}}{rp^{n/2}(1-p)^{n/2}+(1-r)p^{n/2}(1-p)^{n/2}} \leq q_j$$

$$\leq \frac{rp^{(w/2)+1}(1-p)^{(w/2)-1}}{rp^{(w/2)+1}(1-p)^{(w/2)-1}+(1-r)p^{(w/2)-1}(1-p)^{(w/2)+1}}$$

$$r \leq q_j \leq \frac{rp^2}{rp^2+(1-r)(1-p)^2}$$

$$\frac{r}{1-r} \leq \frac{q_j}{1-q_j} \leq \frac{r}{1-r} \cdot \left(\frac{p}{1-p}\right)^2. \qquad Q.E.D.$$

PROPOSITION 7. Suppose the juror utilities satisfy $0.5 \le q_1 \le q_2 \le \ldots \le q_{n-1} \le q_n$. If condition (a), (b), or (c) from proposition 5 is satisfied under voting rule k_1 , then the same condition is satisfied under any other voting rule k_2 satisfying $k_2 > k_1$.

Proof. Suppose condition (a) is satisfied for voting rule k_1 . This means that

$$0 \le q_{k_1} \le \beta(0, n) = \frac{(1-p)^n}{p^n + (1-p)^n} < 0.5.$$

Since $q_j \ge 0.5$ for all j, condition (a) cannot be satisfied for k_1 , and therefore the proposition is satisfied vacuously in this case.

Now suppose condition (b) is satisfied for voting rule k_1 . This means that $\beta(n, n) < q_{k_1} \le 1$. Since $k_1 < k_2$, we have that $q_{k_1} < q_{k_2}$, and thus $\beta(n, n) < q_{k_2} \le 1$. Therefore, condition (b) is also satisfied for voting rule k_2 .

Finally, suppose that condition (c) is satisfied for voting rule k_1 . In this case, the condition is completely independent of the voting rule, and condition (c) is also satisfied for voting rule k_2 .

Q.E.D.

PROPOSITION 8. Suppose that the sincere revelation strategy profile is a subgame perfect Nash equilibrium for two voting rules, $\hat{\mathbf{k}}_1$ and $\hat{\mathbf{k}}_2$. If jurors behave according to this equilibrium, then

- (1) the probability of convicting an innocent defendant is the same under both voting rules; and
- the probability of acquitting a guilty defendant is the same under both voting rules.

Proof. Without loss of generality, assume $k_1 \le k_2$. Existence of the sincere voting Nash equilibrium means that one of the three proposition 5 conditions, (a), (b), or (c), is satisfied for each of the voting rules k_1 and k_2 . It is also straightforward to show that both rules must satisfy the same condition (to see this, follow the same approach as used in the proof of proposition 7).

Suppose both rules satisfy condition (a). In this case, $0 \le q_j \le \beta(0, n)$ for $j = 1, 2, ..., k_1, ..., k_2$. Thus, at least k_2 jurors will always vote to convict in the final vote regardless of the outcome of the preliminary vote and regardless of the voting rule. Therefore, all defendants are convicted under both voting rules, and the probability of trial error under both voting rules is simply 0.5 (the prior probability that the defendant is innocent).

Now suppose both rules satisfy condition (b). In this case, $\beta(n,n) \leq q_j \leq 1$ for $j=k_1,\ldots,k_2,\ldots,n$. Thus, no more than k_1 jurors will ever vote to convict in the final vote regardless of the outcome of the preliminary vote and regardless of the voting rule. Therefore, all defendants are acquitted under both voting rules, and the probability of trial error under both voting rules is simply 0.5 (the prior probability that the defendant is guilty).

Finally, suppose both rules satisfy condition (c). In this case, $\exists k^* \in \{1, ..., n\}$, such that $\beta(k^* - 1, n) \le q_i \le$

 $\beta(k^*, n)$ for all $j \in N$. Recall that the number of votes to convict in the preliminary vote will be equal to |g| in equilibrium. Thus, if $|g| \geq k^*$, then all jurors will vote to convict in the final vote; if $|g| < k^*$, then all jurors will vote to acquit in the final vote. Since all final votes are unanimous, a defendant convicted under one voting rule also would be convicted under the other. Therefore, the probability of convicting an innocent defendant must be the same under both voting rules. Similarly, a defendant acquitted under one voting rule also would be acquitted under the other. Therefore, the probability of acquitting a guilty defendant also must be the same under both voting rules.

Q.E.D.

PROPOSITION 9. Suppose that the sincere revelation strategy profile is a subgame perfect Nash equilibrium for two voting rules, $\hat{\mathbf{k}}_1$ and $\hat{\mathbf{k}}_2$. If jurors behave according to this Nash equilibrium, then the expected utility for any juror is the same under both voting rules.

Proof. In the proof of proposition 8, I showed that the trial outcome will always be the same under both voting rules. Therefore, the expected utility (and the final realized utility) also must be the same under both voting rules. *Q.E.D.*

The following two claims relate to the discussion regarding the appropriate value for r in the section on the theoretical framework for the basic model.

CLAIM 1. With informative voting, the ex ante probability of conviction under unanimity rule in the mustrial model is always between 0.5 and the value of 1 for all parameter combinations.

Proof. The ex ante probability of conviction (in possibly repeated trials) in the mistrial model is given by:

$$\begin{aligned} \operatorname{Prob}_{R}(C) &= \operatorname{Prob}(G) \cdot \operatorname{Prob}_{R}(C|G) + \operatorname{Prob}(I) \cdot \operatorname{Prob}_{R}(C|I) \\ &= r \cdot \operatorname{Prob}_{R}(C|G) + (1-r) \cdot \operatorname{Prob}_{R}(C|I) \\ &= r \cdot \operatorname{Prob}_{R}(A|I) + (1-r) \cdot \operatorname{Prob}_{R}(C|I) \\ &= r \cdot (1 - \operatorname{Prob}_{R}(C|I)) + (1-r) \cdot \operatorname{Prob}_{R}(C|I). \end{aligned}$$

With informative voting, the proof of proposition 3 indicates that:

$$\operatorname{Prob}_{R}(C|I) = \frac{\sum_{x=k}^{n} \binom{n}{x} p^{n-x} (1-p)^{x}}{\sum_{x=k}^{n} \binom{n}{x} (p^{n-x} (1-p)^{x} + p^{x} (1-p)^{n-x})};$$
$$\operatorname{Prob}_{R}(C|I) = \frac{(1-p)^{n}}{(1-p)^{n} + p^{n}}.$$

This gives us:

$$\operatorname{Prob}_{R}(C) = r \frac{p^{n}}{(1-p)^{n} + p^{n}} + (1-r) \frac{(1-p)^{n}}{(1-p)^{n} + p^{n}}$$
$$= \frac{rp^{n} + (1-r)(1-p)^{n}}{p^{n} + (1-p)^{n}}.$$

Now, if $r \ge 0.5$, we have:

$$\frac{rp^n+(1-r)(1-p)^n}{p^n+(1-p)^n}\leq \frac{rp^n+r(1-p)^n}{p^n+(1-p)^n}=r\Rightarrow \operatorname{Prob}_R(C)\leq r.$$

We also have:

$$(2r-1)p^n \ge (2r-1)(1-p)^n$$

$$\Rightarrow 2rp^{n} + 2(1-r)(1-p)^{n} \ge p^{n} + (1-p)^{n}$$

$$\Rightarrow \frac{rp^{n} + (1-r)(1-p)^{n}}{p^{n} + (1-p)^{n}} \ge \frac{1}{2}$$

$$\Rightarrow \operatorname{Prob}_{R}(C) \ge \frac{1}{2}.$$

Thus, for $r \ge 0.5$, we have $\frac{1}{2} \le \operatorname{Prob}_R(C) \le r$. For $r \le 0.5$, I can similarly show that $r \le \operatorname{Prob}_R(C) \le \frac{1}{2}$. Q.E.D.

CLAIM 2. Suppose r = 0.5, $q_j \ge 0.5$ for all $j \in N$, and that the sincere revelation strategy profile is a Nash equilibrium in the communication model. Under this equilibrium, the ex ante probability of conviction will then be less than 0.5 for all voting rules and parameter combinations.

Proof. Suppose that $q_j > \beta(n, n) \ \forall j \in \mathbb{N}$. In this case, all jurors will always vote for acquittal in the sincere revelation equilibrium, so the ex ante probability of conviction is zero, and the claim is proven.

Now suppose it is not true that $q_j > \beta(n, n) \ \forall j \in N$. With $q_j \geq 0.5 \ \forall j \in N$, existence of the sincere revelation equilibrium then requires that $\exists k^* \in \{1, \ldots, n\}$, satisfying $\beta(k^* - 1, n) \leq q_j \leq \beta(k^*, n) \ \forall j \in N$. Note that with r = 0.5, $\beta(k^*, n) < 0.5$ for any $k^* < n/2$. Since $q_j \geq 0.5 \ \forall j \in N$, the constraint $\beta(k^* - 1, n) \leq q_j \leq \beta(k^*, n) \ \forall j \in N$ therefore requires $k^* \geq n/2$.

The ex ante probability of conviction under the sincere revelation equilibrium in then given by:

$$Prob(C) = Prob(G) \cdot Prob(C|G) + Prob(I) \cdot Prob(C|I)$$

$$= r \cdot Prob(C|G) + (1 - r) \cdot Prob(C|I)$$

$$= r \cdot Prob(|g| \ge k^*|G) Prob(C|G)$$

$$+ (1 - r) \cdot Prob(|g| \ge k^*|I)$$

$$= r \sum_{x=k^*}^{n} {n \choose x} p^x (1 - p)^{n-x}$$

$$+ (1 - r) \sum_{x=k^*}^{n} {n \choose x} p^{n-x} (1 - p)^x.$$

Since r = 0.5, we have:

$$Prob(C) = \frac{1}{2} \left[\sum_{x=k^*}^{n} \binom{n}{x} p^x (1-p)^{n-x} + \sum_{x=k^*}^{n} \binom{n}{x} p^{n-x} (1-p)^x \right]$$

$$= \frac{1}{2} \left[\sum_{x=k^*}^{n} \binom{n}{x} p^x (1-p)^{n-x} + \sum_{x=0}^{n-k^*} \binom{n}{x} p^x (1-p)^{n-x} \right]$$

$$\leq \frac{1}{2} \sum_{x=0}^{n} \binom{n}{x} p^x (1-p)^{n-x} = \frac{1}{2}. \qquad Q.E.D.$$

Jury Verdicts and Preference Diversity

DINO GERARDI Northwestern University

develop a model of decision making in juries when there is uncertainty about jurors' preferences. I provide a characterization of the equilibrium strategy under any voting rule and show that nonunanimous rules are asymptotically efficient. Specifically, large juries make the correct decision with probability close to one. My analysis also demonstrates that under the unanimous rule, large juries almost never convict the defendant. The last result contrasts markedly with the literature and suggests that the unanimity rule can protect the innocent only at the price of acquitting the guilty.

urors typically have to decide the fate of defendants without being perfectly informed whether they are innocent or guilty. The jurors can make one of the following mistakes: acquit the guilty or convict the innocent. If the jurors' voting behavior does not vary across different voting rules, then the unanimity rule minimizes the probability of convicting both innocent and guilty defendants. This argument leads to the common belief that the unanimity rule is the appropriate voting rule if we want to protect the innocent.

Feddersen and Pesendorfer (1998) assume that jurors behave strategically and show that voting behavior is indeed sensitive to the voting rule. They derive the surprising result that, in large juries, the probability of convicting the innocent is larger under the unanimity rule than under nonunanimous rules.

This article demonstrates that when there is uncertainty about jurors' preferences, the unanimity rule can still protect innocent defendants against wrongful convictions. I develop a model in which each juror votes strategically, has some private information about the defendant's innocence or guilt, and is uncertain about the other jurors' preferences.

The literature on collective decision making has a long tradition. At the end of the eighteenth century, Condorcet ([1785] 1976) asserted that, under the majority rule, groups of people make better decisions than single individuals and large electorates adopt the correct decision with very high probability. Implicit in Condorcet's jury theorem and subsequent formalizations and extensions (Berg 1993; Grofman and Feld 1988; Klevorick, Rothschild, and Winship 1984; Ladha 1992; Young 1988) is the assumption that individuals, even if members of a committee, behave as if their vote alone determines the final outcome. In particular, a juror votes to convict (acquit) if the probability that the defendant is guilty, given *only* her private information, is greater (smaller) than her threshold of reasonable

Starting with Austen-Smith and Banks (1996), how-

ever, several articles have demonstrated that it is not optimal for jurors to vote according to only their private information (see, among others, Feddersen and Pesendorfer 1997; McLennan 1998; Myerson 1998; Wit 1998). Instead, a strategic juror should condition her vote on the event that it is pivotal, that is, the event in which her decision determines the final outcome. Evidence from experimental studies (Ladha, Miller, and Oppenheimer 1996; McKelvey and Palfrey 1998) also suggests that voters act strategically. This article follows the game-theoretic approach to collective decision making and assumes strategic voting behavior.

Jurors do not know the state of the world, which in our context regards whether the defendant is innocent or guilty. As do Feddersen and Pesendorfer (1998), I assume that each juror receives one of two possible costless signals. Subsequent work relaxes these assumptions by considering the case in which the signals are drawn from a continuous distribution (Duggan and Martinelli 1999) and the case of costly information gathering (Persico 1999).

Finally, I assume uncertainty about jurors' preferences. All jurors prefer the correct verdict (conviction of the guilty and acquittal of the innocent), but they may have different thresholds of reasonable doubt. In other words, they may have different concerns about acquitting the guilty and convicting the innocent. A juror, of course, knows her own threshold of reasonable doubt but is uncertain as to how the other jurors weigh the two possible errors. In an election context, Feddersen and Pesendorfer (1997) also assume uncertainty about preferences and show that, under any nonunanimous voting rule, large electorates fully aggregate the information available to the voters. In Duggan and Martinelli (1999) and Feddersen and Pesendorfer (1998) all jurors share the same preferences. Coughlan (2000) allows for preferences to vary across jurors, but he assumes that each juror knows exactly the preferences of all the others. My article represents a first attempt to compare unanimous and nonunanimous voting rules in environments with uncertainty about preferences and strategic behavior.

I demonstrate the existence of a symmetric equilibrium under any voting rule. The equilibrium strategies assume a very simple form: A juror votes to convict if her threshold of reasonable doubt is smaller than a specified cutpoint, and she votes to acquit if her threshold of reasonable doubt exceeds the cutoff. I show that nonunanimous rules are asymptotically effi-

Dino Gerardi is a Ph.D. candidate in Economics at Northwestern University, Evanston, IL 60208-2600 (d-gerardi@nwu.edu).

The idea for this article appeared in discussion with Timothy Feddersen. My debt to him is obvious. I also thank Pierpaolo Benigno, Eddie Dekel, Michaela Draganska, Jean Pierre Dubé, Nadav Levy, Stéphane Mechoulan, three anonymous referees, and especially Ulrich Doraszelski for helpful comments and suggestions. All errors are my own.

cient, similar to the case in which jurors share the same preferences. Under any nonunanimous rule, large juries make the correct decision with probability close to one.

The asymptotic properties of the unanimity rule change substantially, however, when uncertainty about juror preferences is introduced. In contrast to Feddersen and Pesendorfer (1998), who assume that preferences are the same across jurors, I show that under the unanimity rule, large juries almost never convict the defendant. Hence, the price paid for the protection of the innocent is the acquittal of the guilty. The model suggests that a juror is less likely to vote to convict when she is uncertain about the other jurors' thresholds of reasonable doubt. Intuitively, a voter's assessment that the defendant is guilty, given that all the other jurors are voting to convict, is stronger when preferences do not vary across individuals than when preferences are private information. In the latter case, a juror could be pivotal because fellow jurors may have low thresholds of reasonable doubt and be predisposed to vote to convict regardless of the signals they observe.

The remainder of the article is organized as follows. In the next section I present the model. Then I discuss some preliminary results and turn to the analysis of unanimous and nonunanimous voting rules. I also compare different voting rules in a jury of fixed size. I conclude by suggesting possible extensions of the model. Some technical proofs are relegated to the Appendix.

THE MODEL

A jury composed of n > 1 individuals has to decide whether to acquit (A) or convict (C) a defendant who may be either innocent (I) or guilty (G). I assume that the probability of innocence is equal to the probability of guilt (and therefore equal to 1/2).

Although a juror is uncertain about the state of the world, she observes one of two possible signals, innocent (i) and guilty (g), before the vote takes place. The signal that a juror receives is correlated with the state of the world,

$$\Pr(i|I) = \Pr(g|G) = p,$$

where p belongs in the interval (½, 1) and $\Pr(s|\omega)$ denotes the probability that a juror observes signal s = i, g when the state of the world is $\omega = I$, G. A juror is more likely to observe signal i when the defendant is innocent and signal g when the defendant is guilty. Conditional on the state of the world, the signals are independent across jurors.

A juror does not know the signals observed by the other jurors. It can be argued that jurors have opportunities to reveal their information during delibera-

tions,³ but it cannot simply be assumed that each juror reports her signal truthfully. For example, a juror who is very concerned about acquitting the guilty (because of a low threshold of reasonable doubt) and behaves strategically may have an incentive not to reveal that she observed an innocent signal in order to decrease the probability of acquittal. Coughlan (2000) shows that there exists an equilibrium in which all jurors reveal their information if and only if their preferences are close enough. Since deliberations are not formally modeled here, I assume that the signal each juror receives constitutes private information.

In addition, I assume that jurors have private information about their own preferences. All prefer adopting the correct decision, but they may assign different weights to the two errors a jury can make. Kalven and Zeisel (1966) provide some evidence that jurors have different concerns about the two possible mistaken judgments. Moreover, jurors often do not know much about the other members of the jury, and it is very difficult, if not impossible, for them to find out the exact concerns of one another during the trial. In other words, when a juror votes, she is uncertain not only about the type of the defendant but also about fellow jurors' preferences (Davis 1973).

Formally, each juror has a type $q \in (0, 1)$, which is private information. I assume that Nature selects the jury by choosing n juror types independently, according to a probability distribution F with support on the interval (0, 1), where F(q) denotes the probability that the type belongs to the set (0, q]. We require the distribution function F to be continuous, strictly increasing, and to admit a density f, such that $\lim_{x\to 0} f(x) > 0$ and $\lim_{x\to 1} f(x) > 0$.

Each juror's utility depends on her type q, the state of the world, and the final decision taken by the jury. Specifically,

$$u(A, I, q) = u(C, G, q) = 0,$$

 $u(C, I, q) = -q, \quad u(A, G, q) = q - 1.$

The highest payoff (normalized to zero) is obtained when the right decision is made. If an innocent defendant is convicted, the payoff is -q; if the jury acquits a guilty person, the juror gets a payoff equal to q-1. The parameter q hence reflects the relative weights a juror gives to the two possible errors. A juror with type q close to one is much more concerned about convicting the innocent than acquitting the guilty, whereas a juror with type q close to zero reverses the relative importance of the two possible errors.

The parameter q can also be viewed as a threshold of reasonable doubt. Suppose a juror believes the defendant is guilty with probability π . If the defendant is acquitted the juror's expected payoff is $-\pi(1-q)$; if the defendant is convicted, the juror receives -q(1-q)

¹ This assumption is made only for notational simplicity. The results hold even if the two states are not equally likely.

² The assumption that the probability of receiving signal ι in state I is equal to the probability of observing signal g in state G is made only to simplify the notation.

³ The literature in social psychology and law examines various social processes (such as influence, conformity, coalition alliances) that operate during the phase of deliberations and discusses their effect on the final verdict (see, e.g., Davis 1973, Gelfand and Solomon 1977, Nagel and Neef 1975).

 π). The juror would like the defendant to be convicted if and only if π is greater than q.

The vote is simultaneous, and each juror must vote either to convict or to acquit, but she cannot abstain. The defendant is convicted if at least $r = 1, \ldots, n$ jurors vote to convict and is acquitted otherwise. The parameter r characterizes the voting rule. For example, when r is equal to n we have the unanimity rule; the simple majority rule is defined by r = n/2 + 1 if n is even and r = (n + 1)/2 if n is odd.

A strategy for juror j can be characterized by two measurable functions, $i_j:(0,1)\to[0,1]$ and $g_j:(0,1)\to[0,1]$. The function $i_j(q)$ denotes the probability that the juror votes to convict given a threshold of reasonable doubt q and signal i. Similarly, the probability that the juror votes to convict when her type is q and she observes signal g is denoted by $g_j(q)$.

We say that juror j votes informatively if she votes to acquit when she observes an innocent signal and votes to convict when a guilty signal is realized. In my notation, such behavior is described by the strategy $i_j(q) = 0$ and $g_j(q) = 1$ for all q in the interval (0, 1). Clearly, if all jurors vote informatively, the unanimity rule minimizes (among all voting rules) the likelihood of convicting the innocent, even though it maximizes the probability of acquitting the guilty. Yet, as I show in the next section, when jurors behave strategically, there is no voting rule under which informative voting can be adopted by all members of the jury in equilibrium.

The following class of strategies plays a very important role in my analysis. I say that juror j adopts a cutoff strategy if there exist two numbers, q_i and q_g , in the unit interval such that

$$i_j(q) = \begin{cases} 1 & \text{for } q < q_i \\ 0 & \text{for } q > q_i \end{cases}$$

and

$$g_{J}(q) = \begin{cases} 1 & \text{for } q < q_{g} \\ 0 & \text{for } q > q_{g} \end{cases}$$

A cutoff strategy is characterized by two thresholds, one for each signal the juror can receive. After observing signal s=i,g the juror votes to convict if her type is smaller than the cutoff q_s and votes to acquit if her type is greater than q_s . A juror who uses a cutoff strategy conditions her vote on her signal only if her type is between the two cutpoints. Given a pair of cutoffs (q_i, q_g) , I do not distinguish between cutoff strategies that prescribe a different voting behavior only to the types q_i and q_g , since, under my assumption on the distribution function F, the two strategies differ only on a set of types of measure zero.

I restrict attention to symmetric Bayesian Nash equilibria in which players do not use weakly dominated strategies. Because all players adopt the same behavior, I drop the subscripts from the equilibrium strategies and let i(q) and g(q) denote the probability

that a juror with type q votes to convict when her signal is i and g, respectively.

ANALYSIS

I begin by establishing some general results that hold under any voting rule. I rule out symmetric equilibria in which players use weakly dominated strategies and derive a condition that any strategy which is not weakly dominated must satisfy. Moreover, I show that in equilibrium, jurors adopt cutoff strategies. In the remainder of this section I analyze unanimous and nonunanimous voting rules.

Consider any voting rule that requires at least two votes in order to convict the defendant. The symmetric strategy profile in which each juror votes to acquit, independently of both her threshold of reasonable doubt and her signal (i(q) = g(q) = 0 for all q), constitutes a Bayesian Nash equilibrium. Suppose that all jurors other than juror j vote to acquit. Then juror j's vote is irrelevant, since the defendant will be acquitted in any case. But if her vote is never pivotal, then any decision is optimal for juror j.

Similarly, under a nonunanimous rule a juror is never pivotal if all other members of the jury always vote to convict. Thus, a symmetric strategy profile in which i(q) and g(q) differ from one only on a set of types of measure zero constitutes a Bayesian Nash equilibrium with the probability of zero that a single juror can influence the final verdict.

Yet, all equilibria in which a juror is never pivotal involve weakly dominated strategies. The following lemma states that a juror who does not adopt a weakly dominated strategy must vote to acquit if she is very concerned about convicting the innocent (i.e., if her type is close to one) and must vote to convict if she is very concerned about acquitting the guilty (if her type is close to zero).

Lemma 1. Consider an arbitrary voting rule r = 1, ..., n. If a strategy $(i(\cdot), g(\cdot))$ is not weakly dominated, then

$$i(q) = \begin{cases} 1 & \text{if } q \in \left[0, \frac{1}{1 + \left(\frac{p}{1-p}\right)^n}\right] \\ 0 & \text{if } q \in \left[\frac{1}{1 + \left(\frac{1-p}{p}\right)^{n-2}}, 1\right] \end{cases}$$

$$g(q) = \begin{cases} 1 & \text{if } q \in \left[0, \frac{1}{1 + \left(\frac{p}{1-p}\right)^{n-2}}\right] \\ 0 & \text{if } q \in \left[\frac{1}{1 + \left(\frac{1-p}{p}\right)^n}, 1\right] \end{cases}$$

⁴ In this model a final verdict is always achieved. Coughlan (2000) considers the possibility of a mistrial.

⁵ Other symmetric equilibria in which a juror's vote is never pivotal can be easily constructed by assuming that i(q) and g(q) are different from zero only on a set of types of measure zero. Again, the probability that a juror's decision is relevant to determine the fate of the defendant is zero, and therefore any voting behavior is optimal for a single juror.

Proof. Take an arbitrary strategy profile and consider juror j. Suppose her type is q, and she has received signal s = i, g. Let $\psi(z, \omega)$ denote the probability that exactly z out of her n-1 fellow jurors vote to convict when the state of the world is $\omega = I$, G. The expected utility of a juror who votes to convict is given by

$$\Pr(G|s) \left[1 - \sum_{x=r-1}^{n-1} \psi(z, G) \right] (q-1)$$
$$- \Pr(I|s) \sum_{x=r-1}^{n-1} \psi(z, I) q.$$

The expected utility if she votes to acquit is

$$\Pr(G|s) \left[1 - \sum_{z=r}^{n-1} \psi(z, G) \right] (q-1)$$
$$-\Pr(I|s) \sum_{z=r}^{n-1} \psi(z, I) q.$$

The difference in utility between voting to convict and voting to acquit is

$$\Pr(G|s)\psi(r-1, G)(1-q) - \Pr(I|s)\psi(r-1, I)q.$$

There are two possibilities. Either the juror is never pivotal, that is, $\psi(r-1, G) = \psi(r-1, I) = 0$, or there is a positive probability that the juror is pivotal, that is, both $\psi(r-1, G)$ and $\psi(r-1, I)$ are strictly positive. In the former case any decision is optimal. In the latter, the juror strictly prefers to vote to convict if

$$q < \frac{\Pr(G|s)\psi(r-1, G)}{\Pr(G|s)\psi(r-1, G) + \Pr(I|s)\psi(r-1, I)}$$

$$= \frac{\Pr(s|G)\psi(r-1, G)}{\Pr(s|G)\psi(r-1, G) + \Pr(s|I)\psi(r-1, I)}$$

$$= P(G|s, piv), \qquad (1)$$

where P(G|s, piv) denotes the probability that the defendant is guilty, given that juror j receives signal s and is pivotal. The juror strictly prefers to vote to acquit when the sign of the above inequality is reversed.

Let N_{-j} denote the set of all jurors other than juror j. Given any strategy profile $(g_{\eta}(q), i_{\eta}(q))_{\eta \in N_{-j}}$ such that juror j is pivotal with positive probability, P(G|s, piv) can be rewritten as

$$P(G|s, piv) = \left[1 + \frac{\Pr(s|I)}{\Pr(s|G)} \frac{\sum_{\substack{M \subset N_{\neg r}|M|=r-1}} \rho_{M}}{\sum_{\substack{M \subset N_{\neg r}|M|=r-1}} \tau_{M}}\right]^{-1},$$

where

$$\rho_{M} = \prod_{\eta \in M} \left(p \int i_{\eta}(q) \ dF(q) \right)$$

$$+ (1-p) \int g_{\eta}(q) dF(q) dF(q)$$

$$\prod_{\eta \notin M} \left(p \int (1-i_{\eta}(q)) dF(q) dF(q) \right) dF(q)$$

$$+ (1-p) \int (1-g_{\eta}(q)) dF(q) dF(q) dF(q),$$

and

$$\begin{split} \tau_{\mathit{M}} &= \prod_{\eta \in \mathit{M}} \left((1-p) \int i_{\eta}(q) \; dF(q) \right. \\ &+ p \int g_{\eta}(q) \; dF(q) \right) \\ &\prod_{\eta \notin \mathit{M}} \left((1-p) \int \left(1 - i_{\eta}(q) \right) \; dF(q) \right. \\ &+ p \int \left(1 - g_{\eta}(q) \right) \; dF(q) \right). \end{split}$$

It is easy to show that $((1-p)/p)^{n-1} \le \rho_M/\tau_M \le (p/(1-p))^{n-1}$, for any subset $M \subset N_{-j}$, such that τ_M , and therefore ρ_M , are different from zero. This, in turn, implies

$$\left(\frac{1-p}{p}\right)^{n-1} \leq \frac{\sum\limits_{\boldsymbol{M}\subset N_{-p}|\boldsymbol{M}|=r-1}^{p}\rho_{\boldsymbol{M}}}{\sum\limits_{\boldsymbol{M}\subset N_{-p}|\boldsymbol{M}|=r-1}^{p}\tau_{\boldsymbol{M}}} \leq \left(\frac{p}{1-p}\right)^{n-1},$$

and therefore I obtain

$$0 < \frac{1}{1 + \frac{\Pr(s|I)}{\Pr(s|G)} \left(\frac{p}{1-p}\right)^{n-1}} \le P(G|s, piv)$$

$$\le \frac{1}{1 + \frac{\Pr(s|I)}{\Pr(s|G)} \left(\frac{1-p}{p}\right)^{n-1}} < 1.$$

Consider a juror who observes signal s and whose type belongs to the interval $(0, [1 + (\Pr(s|I)/\Pr(s|G))(p/(1-p))^{n-1}]^{-1})$. Equation 1 implies that whenever her vote matters, voting to convict is strictly better than voting to acquit. Similarly, consider a juror whose type belongs to the interval $([1 + (\Pr(s|I)/\Pr(s|G))((1-p)/p)^{n-1}]^{-1}, 1)$. Again, equation 1 implies that when the juror is pivotal, she strictly prefers voting to acquit. It follows that any strategy $(g(\cdot), i(\cdot))$ which is not weakly dominated must satisfy the conditions given by lemma 1. Q.E.D.

The intuition behind lemma 1 is simple. The expression $[1 + (\Pr(s|I)/\Pr(s|G))((1-p)/p)^{n-1}]^{-1}$ denotes the probability that the defendant is guilty given that

n-1 jurors observe guilty signals and the last juror receives signal s. Consider a juror who observes signal s and whose threshold of reasonable doubt is greater than $[1 + (\Pr(s|I)/\Pr(s|G))((1-p)/p)^{n-1}]^{-1}$ (i.e., the juror is very concerned about convicting an innocent defendant). Clearly, the juror prefers the defendant to be acquitted even if she knows that all her fellow jurors received guilty signals. Therefore, any time there is a positive probability that her vote makes a difference, the juror strictly prefers to vote to acquit. She is indifferent between voting to acquit and voting to convict when the final verdict does not depend on her decision. I conclude that voting to acquit weakly dominates voting to convict.

Analogously, the expression $[1 + (\Pr(s|I)/\Pr(s|G))(p/(1-p))^{n-1}]^{-1}$ represents the probability that the defendant is guilty, given that a juror observes signal s and all the other n-1 jurors receive innocent signals. Voting to acquit is a weakly dominated strategy for a juror who receives signal s and whose threshold of reasonable doubt is smaller than $[1 + (\Pr(s|I)/\Pr(s|G))(p/(1-p))^{n-1}]^{-1}$. The juror is so concerned about acquitting the guilty that she would like the defendant to be convicted even if all the other members of the jury observe innocent signals. Thus, either the juror's vote is decisive and she strictly prefers to vote to convict or her vote cannot change the final verdict and she is indifferent between the two alternatives.

An important consequence of lemma 1 is that if a juror does not adopt a weakly dominated strategy, the ex ante probability that she votes to convict is strictly between zero and one in any state of the world (by ex ante I mean that the probability is computed before knowing the juror's type and the realization of her signal). This in turn implies that, in all equilibria in which players do not use weakly dominated strategies, the probability that a juror's vote is pivotal is strictly positive.

I now describe equilibrium behavior. The following lemma shows that in equilibrium jurors use cutoff strategies.

Lemma 2. Under any voting rule, the symmetric equilibrium strategy has a cutoff structure with thresholds (q_i, q_g) that satisfy $0 < q_i < q_g < 1$.

Proof. Fix a voting rule $r=1,\ldots,n$. Consider a juror whose type is q and who observes signal $s=\iota,g$. Since, by assumption, her opponents do not use weakly dominated strategies, the probability that the juror's vote is pivotal is strictly positive. From the proof of lemma 1 (equation 1) it follows that the juror prefers to vote to acquit (convict) if her type is greater (smaller) than P(G|s,piv). If her type q is exactly equal to P(G|s,piv), then the juror is indifferent between the two alternatives, and she will adopt a cutoff strategy with cutpoint $q_1 = P(G|i,piv)$ and $q_3 = P(G|g,piv)$. The expressions of P(G|i,piv) and P(G|g,piv) are, respectively:

$$P(G|i, piv) = \frac{1}{1 + \left(\frac{p}{1-p}\right) \frac{\psi(r-1, I)}{\psi(r-1, G)}},$$

$$P(G|g, piv) = \frac{1}{1 + \left(\frac{1-p}{p}\right) \frac{\psi(r-1, I)}{\psi(r-1, G)}},$$

where $\psi(r-1, \omega)$ is the probability that r-1 out of the other n-1 jurors will vote to convict in state $\omega = I$, G. Since $\frac{1}{2} , I conclude that <math>0 < P(G|i, piv) < P(G|g, piv) < 1.6$ Q.E.D.

To provide some intuition for lemma 2, I assume that the jury uses the unanimity rule (a similar argument can be made for any other voting rule). In order to decide how to vote, a juror should compare her threshold of reasonable doubt q with the probability that the defendant is guilty, given all the information she has. Even though the signal observed by each juror is private information and the vote is simultaneous, in equilibrium the juror knows something more than her own signal. In fact, the strategies adopted by all players are commonly known in equilibrium. Moreover, the juror knows that her vote matters only if all the other jurors vote to convict, and therefore she should condition her decision on this event. The juror should use her opponents' strategies to compute P(G|s, piv), the probability that the defendant is guilty, given her signal s = i, g and the fact that her vote is pivotal. Then the juror should vote to convict if P(G|s, piv) is greater than her threshold of reasonable doubt and should vote to acquit otherwise.

I conclude this section by showing why the strategy profile that prescribes informative voting by all players cannot constitute an equilibrium under any voting rule. The probability that the defendant is guilty, given that a juror who observes an innocent signal is pivotal (when all the other players vote informatively), is given by

$$P(G|i, piv) = \frac{1}{1 + \left(\frac{1-p}{p}\right)^{r-1} \left(\frac{p}{1-p}\right)^{n-r+1}} > 0.$$

A juror who receives signal i and has a threshold of reasonable doubt smaller than P(G|i,piv) is not willing to vote to acquit. Similarly, after observing signal g, a juror whose threshold of reasonable doubt is larger than

$$P(G|g, piv) = \frac{1}{1 + \left(\frac{1-p}{p}\right)^r \left(\frac{p}{1-p}\right)^{n-r}} < 1$$

prefers to vote to acquit if all her fellow jurors vote informatively.

⁶ For notational simplicity, in lemma 2 I consider only symmetric equilibria. This proof can be used to show, however, that jurors use cutoff strategies in *any* Bayesian Nash equilibrium in weakly undominated strategies.

THE UNANIMITY RULE

In this section I analyze collective decision making under the unanimity rule. I first show the existence of a symmetric Bayesian Nash equilibrium and then investigate its asymptotic properties.

From the previous section we know that a symmetric Bayesian Nash equilibrium is completely characterized by a pair of numbers (q_i, q_g) , the cutoffs associated with signals i and g. A juror who observes signal s = i, g is indifferent between voting to acquit and voting to convict only when her type is equal to the probability that the defendant is guilty, given that her signal is s and her vote is decisive. To find the equilibrium values of the cutoffs, I need to express P(G|s, piv) in terms of q_i and q_g and then equate P(G|s, piv) to q_s , for s = i, g.

Formally, let γ_{ω} denote the ex ante probability that a given juror votes to convict when the state of the world is $\omega = I$, G. Given a cutoff strategy with cutpoints q_i and q_g , the expressions of γ_I and γ_G are given by

$$\gamma_I = pF(q_i) + (1-p)F(q_i), \qquad (2)$$

and

$$\gamma_G = (1 - p)F(q_t) + pF(q_s). \tag{3}$$

The equilibrium cutoffs are therefore the solution to the following system of equations:

$$q_{I} = \frac{1}{1 + \left(\frac{p}{1 - p}\right) \left(\frac{\gamma_{I}}{\gamma_{G}}\right)^{n - 1}},$$
 (4)

$$q_{g} = \frac{1}{1 + \left(\frac{1-p}{p}\right)\left(\frac{\gamma_{I}}{\gamma_{G}}\right)^{n-1}}.$$
 (5)

The existence of a symmetric Bayesian Nash equilibrium is guaranteed by proposition 1. In the proof I use a fixed point argument to show that the system of equations 4 and 5 admits at least a solution (q_i, q_g) that satisfies $0 < q_i < q_g < 1.7$

Proposition 1. Under the unanimity rule, a symmetric Bayesian Nash equilibrium exists for any jury size.

Proof. From equations 4 and 5 the cutpoint q_i can be expressed as a function of q_g as follows:

$$q_{t} = k(q_{g}) := \frac{q_{g}(1-p)^{2}}{q_{g}(1-p)^{2} + (1-q_{g})p^{2}}.$$
 (6)

The function k is differentiable and strictly increasing on [0, 1]. Moreover, $0 < k(q_g) < q_g$ for all q_g in (0, 1) and k(1) = 1.

Consider the function $v_n:(0,1]\to(0,1)$ defined by

$$\nu_{n}(q_{g}) := \frac{1}{1 + \left(\frac{1-p}{p}\right) \left[\frac{(1-p)F(q_{g}) + pF(k(q_{g}))}{pF(q_{g}) + (1-p)F(k(q_{g}))}\right]^{n-1}}.$$
(7)

Clearly, if \bar{q}_g is a fixed point of the function v_n , then $(k(\bar{q}_g), \bar{q}_g)$ is a solution to the system of equations 4 and 5. The function v_n is continuous, $v_n(1) = p$ for every n and

$$\lim_{q_{p} \to 0} v_{n}(q_{g}) = \frac{1}{1 + \left(\frac{1-p}{p}\right) \left[\frac{(1-p) + p\left(\frac{1-p}{p}\right)^{2}}{p + (1-p)\left(\frac{1-p}{p}\right)^{2}}\right]^{n-1}} > 0,$$

where I make use of L'Hospital's rule (the above limit converges to one as the jury size grows large). For any given n, the function v_n has at least one fixed point in the interval (0, 1). Therefore, a symmetric Bayesian Nash equilibrium exists.

Q.E.D.

I now turn to the asymptotic properties of the unanimity rule. I index the probabilities of mistakes by n and let $P_n(C|I)$ denote the probability that an innocent defendant is convicted by a jury of size n. Analogously, $P_n(A|G)$ represents the probability of acquitting a guilty person when there are n jurors.

When all jurors have the same preferences, Feddersen and Pesendorfer (1998) show that $P_n(C|I)$ is bounded away from zero even in large juries and that this probability can be increasing in the number of jurors. The next proposition demonstrates that these results do not extend to an environment in which there is uncertainty about jurors' preferences. When jurors are uncertain about their fellow jurors' thresholds of reasonable doubt, large juries almost never convict the defendant under the unanimity rule. Hence, the price paid for the protection of the innocent is the acquittal of the guilty.

PROPOSITION 2. Under the unanimity rule,

$$\lim_{n\to\infty}P_n(C|I)=0$$

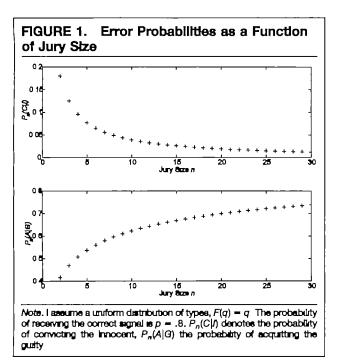

and

$$\lim_{n\to\infty}P_n(A|G)=1.$$

Proof. See Appendix.

An increase in the jury size has two opposite effects on the probability of convicting the defendant. First, given a particular strategy, the probability of conviction decreases as the number of jurors increases. Second, when the size of the jury is large and the unanimity rule is adopted, the fact that a juror is pivotal constitutes strong evidence that the defendant is guilty. This makes a juror more willing to vote to convict. In fact, in the proof of proposition 2 I show that the equilibrium

⁷ Proposition 1 does not guarantee uniqueness of the symmetric Bayesian Nash equilibrium. It is possible to construct both examples with multiple symmetric equilibria and examples that admit a unique symmetric Bayesian Nash equilibrium.

cutpoints q_i and q_g converge to one when the number of jurors goes to infinity. This means that the ex ante probability that a juror votes to convict is close to one, and the fraction of players who condition their vote on their signal converges to zero.

In the proof I demonstrate that the first effect is dominant, and large juries almost never convict the defendant. The asymptotic properties of the unanimity rule in a world with uncertainty about jurors' preferences thus differ substantially from the properties of the unanimity rule when all jurors share the same preferences. A juror is less likely to vote to convict when she is uncertain about her opponents' thresholds of reasonable doubt. Intuitively, the evidence that the defendant is guilty when a juror is pivotal is stronger when preferences do not vary across individuals than when preferences are private information. In the latter case, a juror's vote could be decisive because the other members of the jury may have low thresholds of reasonable doubt and be predisposed to vote to convict regardless of the signals they receive.

The speed of convergence of the error probabilities to the limit values given in proposition 2 depends, of course, on the distribution of juror types and on p, the probability of receiving the correct signal. Here I provide an example to see whether the asymptotic results can represent a good approximation of the error probabilities in small juries. I assume that juror types are drawn from a uniform distribution and let the probability of observing the right signal be p=.8. Figure 1 illustrates the error probabilities as a function of the jury size.

The convergence of $P_n(C|I)$ to zero is fast. In a 12-person jury the probability of convicting an innocent

defendant is about 3% (the probability decreases to 1% when the jury size is n=30). The convergence of $P_n(A|G)$ to one is much slower (this is a general result, see proposition 3 below). When there are 30 jurors, the probability that a guilty defendant will be convicted is still 25% (the probability is 35% in a 12-person jury). This example suggests that in small juries the unanimity rule can protect an innocent defendant from a mistaken conviction. Moreover, protection of the innocent does not necessarily imply acquittal of the guilty.

As shown in Figure 1, the probability of convicting the innocent decreases as the number of jurors increases, whereas the probability of acquitting the guilty increases with jury size. In this example it is possible to make the conviction of the innocent less likely by increasing the number of jurors, even though this reduces the likelihood of convicting the guilty.

The next result concerns the probability that a convicted defendant is innocent, which I denote by $P_n(I|C)$. Even though in large juries a defendant is convicted with small probability, proposition 3 establishes that a convicted defendant is very likely to be guilty. For large juries $P_n(I|C)$ cannot be immediately derived by applying Bayes's rule, since both $P_n(C|I)$ and $P_n(C|G)$ are zero in the limit.

Proposition 3. Under the unanimity rule,

$$\lim_{n\to\infty}P_n(I|C)=0.$$

Proof. See Appendix.

The probability of conviction when the defendant is innocent converges to zero faster than the probability of conviction when the defendant is guilty. As the jury size grows large, the ratio $P_n(C|I)/P_n(C|G)$ goes to zero. Thus, conditional on being convicted by a large jury, the defendant is innocent with probability close to zero.

NONUNANIMOUS VOTING RULES

In this section I consider nonunanimous voting rules. Again, I show the existence of symmetric Bayesian Nash equilibria and then investigate the asymptotic properties. Since the jury size will be allowed to vary, it is convenient to define a nonunanimous rule by the fraction α of votes needed to convict. For notational simplicity I restrict attention to combinations of α and n, such that αn is an integer.

As was shown in lemma 2 the equilibrium strategy has a cutoff structure. Similar to the unanimity rule case, a juror will be indifferent between voting to convict and voting to acquit only when her threshold of reasonable doubt coincides with the probability that the defendant is guilty, given her signal and the fact that her vote is decisive. Thus the equilibrium cutoffs corresponding to the voting rule α are the solutions to the following system of equations:

$$q_{i} = \frac{1}{1 + \left(\frac{p}{1-p}\right) \left(\frac{\gamma_{I}}{\gamma_{G}}\right)^{\alpha n-1} \left(\frac{1-\gamma_{I}}{1-\gamma_{G}}\right)^{n(1-\alpha)}}, \quad (8)$$

$$q_{s} = \frac{1}{1 + \left(\frac{1-p}{p}\right) \left(\frac{\gamma_{I}}{\gamma_{G}}\right)^{\alpha n-1} \left(\frac{1-\gamma_{I}}{1-\gamma_{G}}\right)^{n(1-\alpha)}}, \quad (9)$$

where γ_I and γ_G (defined in equations 2 and 3) represent the ex ante probability that a juror votes to convict in state I and G, respectively. Proposition 4 below is the analog of proposition 1 for nonunanimous voting rules. It shows that under any nonunanimous voting rule it is possible to find an optimal cutoff strategy for a single juror given that the same strategy is adopted by all the other members of the jury.

Proposition 4. Under any nonunanimous rule, a symmetric Bayesian Nash equilibrium exists for any jury size.

Proof. I prove that the system of equations 8 and 9 admits a solution (q_i, q_g) that satisfies $0 < q_i < q_g < 1$. By inspecting equations 8 and 9 we notice that $q_i = k(q_g)$, where the function k is defined in equation 6. Consider the function $d_n: (0, 1) \to (0, 1)$, defined by:

$$d_{\pi}(q_{g}) := \left\{ 1 + \left(\frac{1-p}{p} \right) \left[\frac{(1-p)F(q_{g}) + pF(k(q_{g}))}{pF(q_{g}) + (1-p)F(k(q_{g}))} \right]^{\alpha \pi - 1} \cdot \left[\frac{1-(1-p)F(q_{g}) - pF(k(q_{g}))}{1-pF(q_{g}) - (1-p)F(k(q_{g}))} \right]^{\pi(1-\alpha)} \right\}^{-1}. \quad (10)$$

If \bar{q}_g is a fixed point of the function d_n , then $(k(\bar{q}_g), \bar{q}_g)$ solves the system of equations 8 and 9. The function d_n is continuous on (0, 1). By applying L'Hospital's rule I obtain

 $\lim_{q_{\mathtt{m}} \to 0} d_{\mathtt{m}}(q_{\mathtt{g}})$

$$= \frac{1}{1 + \left(\frac{1-p}{p}\right) \left[\frac{(1-p) + p\left(\frac{1-p}{p}\right)^2}{p + (1-p)\left(\frac{1-p}{p}\right)^2}\right]^{\cos - 1}} > 0$$

(the limit converges to one as n goes to infinity) and

$$\lim_{q_{\mathbf{g}}\to 1}\,d_{\mathbf{g}}(q_{\mathbf{g}})$$

$$= \frac{1}{1 + \left(\frac{1-p}{p}\right) \left[\frac{(1-p) + p\left(\frac{p}{1-p}\right)^{2}}{p + (1-p)\left(\frac{p}{1-p}\right)^{2}}\right]^{n(1-\alpha)}} < 1$$

(the limit converges to zero as n goes to infinity). I conclude that for all n the function g_n has a fixed point in the interval (0, 1).

Q.E.D.

I now analyze the probability of a mistaken judgment when the jury size is large. The following proposition shows that nonunanimous rules are asymptotically efficient. Under any nonunanimous rule, large juries convict the guilty and acquit the innocent with probability close to one.

Proposition 5. Under any nonunanimous rule,

$$\lim_{n\to\infty} P_n(C|I) = \lim_{n\to\infty} P_n(A|G) = 0.$$

Proof. See Appendix.

In the proof I show that for large juries $\gamma_I < \alpha <$ γ_G , that is, the fraction of votes needed to convict is strictly between the ex ante probability that a juror votes to convict when the defendant is innocent and the ex ante probability that a juror votes to convict when the defendant is guilty. In order to provide some intuition for this result, I consider what could happen if instead $\alpha < \gamma_I < \gamma_G$ and the jury size is large. In this case the probability that the defendant is guilty, given that the juror is pivotal, will be very small.8 Since α is closer to γ_I than to γ_G , when a juror is pivotal, that is, when the actual share of votes to convict is almost α , it is much more likely that the state of the world is I. Thus, the juror will not be willing to convict, that is, her optimal cutoffs should be close to zero. But then the ex ante probability that a juror votes to convict cannot be greater than α .

Similarly, if $\gamma_I < \gamma_G < \alpha$ and the jury size is large, then it is very likely that the defendant is guilty when a single juror is pivotal. The juror should vote to convict for almost all values of q. But this implies that both γ_I and γ_G should be close to one and greater than α .

The remaining possibility is that $\gamma_I < \alpha < \gamma_G.^9$ When the defendant is innocent and the jury is very large, the actual share of votes to convict will be close to γ_I (by the law of large numbers), and the defendant will be acquitted with probability close to one. Similarly, if the defendant is guilty, then the actual fraction of votes to convict will be close to γ_G for large values of n, and with probability close to one the defendant will be convicted. ¹⁰

⁸ Consider the expressions of q_i and q_g in equations 8 and 9. When $\alpha < \gamma_I < \gamma_G$, we have $[(\gamma_I)^n (1 - \gamma_I)^{(1-\alpha)}]/[(\gamma_G)^{\alpha} (1 - \gamma_G)^{(1-\alpha)}] > 1$, which implies that for large values of n the cutoffs q_i and q_g are close to zero

⁹ Recall that in any equilibrium q_i is strictly smaller than q_g , and therefore γ_G is strictly greater than γ_I

¹⁰ In my example with a uniform distribution of juror types and p = .8, the convergence to the limit probabilities given in proposition 5 seems to be reasonably fast. For example, under the simple majority rule, both the probability of convicting the mnocent and the probability of acquitting the guilty are close to 2.1% when the jury size is n = 29. Under the supermajority rule $\alpha = 2/3$, a 30-person jury convicts the innocent with probability of 2% and acquits the guilty with probability of 3.6%.

Voting Rule r	1	.08697	.15313	.25687	5 .39618	6 .55357
Equilibrium cutoff for signal / (q,)	.04798					
Equilibrium cutoff for signal g (q_g)	.44643	.60382	.74313	.84687	.91303	.95202
Probability of convicting the innocent	.55936	.32091	.20422	.14630	.10895	.06448
Probability of acquitting the guilty	.06448	.10895	.14630	.20422	.32091	.55936

COMPARISON OF THE VOTING RULES

The previous analysis has shown that, for sufficiently large juries, any nonunanimous rule outperforms the unanimous rule in terms of minimizing the probability of a mistaken verdict. In particular, in the case of infinitely large juries, the unanimous rule is the only voting rule that never leads to a conviction of a guilty defendant. Hence, any nonunanimous rule aggregates the available information efficiently, but this is not the case for the unanimity rule.

Yet, the analytical results pertain to the limiting case of infinitely large juries, so this section is devoted to a comparison of different voting rules in a jury of fixed size. I investigate whether there is a relationship between the probabilities of mistaken judgments and the number of votes needed to convict.

As my examples show, we cannot draw any conclusion of general validity. There are cases in which requiring more votes to convict makes conviction of both the innocent and the guilty less likely, similar to what happens when jurors vote informatively. Yet, it is also possible to construct examples in which the probability of convicting the innocent is greater under the unanimity rule than under majority rules.

I consider a six-person jury and assume that the probability of receiving the right signal is p = .8 and that juror types are drawn from a uniform distribution. Table 1 reports for any voting rule r = 1, ..., 6, the equilibrium cutpoints¹¹ and the probabilities of mistaken judgments.

Equilibrium voting behavior is quite sensitive to the voting rule. The equilibrium cutoff associated with signal i ranges from .04 when only one vote is needed to convict to .55 under the unanimity rule. Similarly, conditional on receiving a guilty signal, the probability that a juror votes to convict is .44 when r = 1 and .95 when r = 6. Such a variation in individual behavior may seem surprising, but bear in mind that the event on which each juror conditions her vote varies with the voting rule. When r = 1, a juror is not willing to convict, since her vote is decisive only when no other juror is voting to convict, an event which strongly supports the conjecture that the defendant is innocent. Under the unanimity rule, being pivotal is strong evidence that the defendant is guilty, since all the other jurors are voting to convict. A juror is more inclined in this case to vote to convict.

This example also illustrates a trade-off between voting rules. As the number of votes required to convict increases, the jury is less likely to convict the innocent, but there is a higher probability of acquitting the guilty.¹²

Requiring more votes to convict, however, does not necessarily mean greater protection of the innocent. Moreover, it is not always the case that juries face a trade-off when choosing among different voting rules. I provide a simple example in which the majority rule performs better than the unanimity rule in terms of minimizing the probabilities of both errors.

I assume that there are three jurors who receive the correct signal with probability p = .8. The distribution function F satisfies

$$F(q_i) = .1$$
, $F(q_i') = .5$, $F(q_g) = .6$, $F(q_g') = .8$, where $q_i \sim .2809$, $q_i' \sim .3039$, $q_g \sim .8621$, and $q_g' \sim .8748$.

It is easy to check that (q_i, q_g) are the cutpoints of a symmetric Bayesian Nash equilibrium for the majority rule (r=2), and that (q_i', q_g') are the cutoffs of a symmetric Bayesian Nash equilibrium for the unanimity rule. Under the majority rule, the probability of convicting the innocent is .104 and the probability of acquitting the guilty is .5. Under the unanimity rule, the innocent are convicted with probability .1756 and the guilty are acquitted with probability .5948. Clearly, both errors are more likely when unanimous agreement is needed to convict. 13

CONCLUSION

This article develops a model of collective decision making in an environment of uncertainty about juror preferences. Nonunanimous rules are asymptotically efficient, whereas the unanimity rule fails to aggregate information efficiently. In large juries that adopt the unanimity rule, the probability of convicting the innocent is close to zero, but the probability of acquitting the guilty is almost one. The last result contrasts markedly with the literature and suggests that the

When juror types are drawn from a uniform distribution, the symmetric Bayesian Nash equilibrium (in weakly undominated strategy) is unique.

¹² Note that in this example the probability of convicting the innocent under voting rule r coincides with the probability of acquitting the guilty under voting rule n+1-r. This is a special property of the uniform distribution and does not extend to generic distribution functions.

¹³ It is possible to construct examples, which I do not report for brevity, in which the probability of any error decreases as the number of votes to convict increases.

unanimity rule can protect the innocent only at the price of acquitting the guilty.

I have compared different voting rules in a jury of fixed size. There are cases in which requiring more votes to convict decreases the probability of conviction, and there are also cases in which the probability of a conviction under the unanimity rule exceeds the likelihood under majority rules. Since real-world juries tend to be small, the properties of voting rules in juries of finite size deserve further investigation.

Moreover, jurors are exposed to the same evidence during the trial, and a natural extension of my model would be to introduce correlation among jurors' signals. Another interesting extension would be to allow jurors to communicate before reaching a verdict. Because deliberations present the jury with an opportunity to communicate private information, they may play a decisive role in shaping the final verdict.

APPENDIX

Proof of Proposition 2

Since the equilibrium need not be unique, I show that the results stated in proposition 2 hold for any sequence of symmetric Bayesian Nash equilibria. I write q_1^n and q_3^n for the cutoffs corresponding to a symmetric Bayesian Nash equilibrium when the jury size is n. Similarly, I use γ_n^n to denote the ex ante probability that a juror votes to convict in state $\omega = I$, G when the number of players is n. I need to establish a preliminary lemma.

LEMMA 3. Let $\{q_i^n, q_g^n\}_{n=2}^\infty$ be a sequence of equilibrium cutoffs under the unanimity rule. Then

$$\lim_{n\to\infty}q_i^n=\lim_{n\to\infty}q_i^n=1.$$

Proof. Consider the function $h:[0,1] \to (0,1]$ defined by

$$h(x) := \begin{cases} \frac{(1-p)F(x) + pF(k(x))}{pF(x) + (1-p)F(k(x))} & \text{for } x \in (0, 1] \\ \frac{(1-p) + p\left(\frac{1-p}{p}\right)^2}{p + (1-p)\left(\frac{1-p}{p}\right)^2} & \text{for } x = 0 \end{cases}$$
(11)

where the function k is defined in equation 6. The function h is continuous on [0, 1], and h(x) < 1 for all x < 1.

We can express the function v_n defined in equation 7 as

$$\nu_{\mathbf{a}}(x) = \frac{1}{1 + \left(\frac{1-p}{p}\right)(h(x))^{\mathbf{a}-1}}.$$
 (12)

Fix $\varepsilon > 0$. Let h_{ε} be the maximum of h on the interval $[0, 1-\varepsilon]$ (the maximum exists since h is continuous). Since $h_{\varepsilon} \in (0, 1)$ there exists $\bar{n} > 0$ such that $1/[1 + ((1-p)/p)(h_{\varepsilon})^{n-1}] > 1 - \varepsilon$ for all $n > \bar{n}$. This, in turn, implies $v_n(x) > 1 - \varepsilon > x$ for all x in the interval $[0, 1-\varepsilon]$ and all $n > \bar{n}$. Therefore, the fixed point of the function v_n is greater than $1 - \varepsilon$ for every $n > \bar{n}$. I conclude $\lim_{n \to \infty} q_{\varepsilon}^n = 1$. Finally, $\lim_{n \to \infty} q_1^n = \lim_{n \to \infty} k(q_{\varepsilon}^n) = 1$, where the last equality holds since k is a continuous function and k(1) = 1.

I am now ready to show that an innocent defendant will almost never be convicted by large juries. From equation 5 we can express $(\gamma_I^n)^{n-1}$ as a function of q_*^n :

$$(\gamma_I^n)^{n-1} = \frac{p(1-q_g^n)(\gamma_O^n)^{n-1}}{(1-p)q_g^n}.$$

As q_g^n converges to one, the numerator $p(1-q_g^n)(\gamma_G^n)^{n-1}$ converges to zero—it is majorized by $p(1-q_g^n)$ —while the denominator $(1-p)q_g^n$ converges to (1-p). Thus, $\lim_{n\to\infty} (\gamma_I^n)^{n-1} = 0$. Since for any $n < \gamma_I^n < 1$, I conclude that $\lim_{n\to\infty} P_n(C|I) = \lim_{n\to\infty} P_n(C|G) = 0$ is more involved. I use a contradiction argument. If $P_n(C|G)$ does not converge to zero, then for some g in the interval (0,n) it is possible to

The proof that $\lim_{n\to\infty} P_n(C|G) = 0$ is more involved. I use a contradiction argument. If $P_n(C|G)$ does not converge to zero, then for some ε in the interval (0, p) it is possible to find a subsequence $\{(\gamma_G^n)^n\}$ such that $(\gamma_G^n)^n \ge \varepsilon$ for all n. The subsequence $\{(\gamma_G^n)^n\}$ is bounded, so it contains a convergent subsequence. Without loss of generality I suppose that this is true of $\{(\gamma_G^n)^n\}$ itself. I let $a \ge \varepsilon$ denote the limit and show that $a \le p$. From equation 2 we have

$$(\gamma_I^n)^n = [pF(q_I^n) + (1-p)F(q_I^n)]^n > (F(q_I^n))^n$$

which implies that $\lim_{n\to\infty} (F(q_i^n))^n = 0$. Also from equation 3 we obtain

$$(\gamma_G^n)^n = [(1-p)F(q_i^n) + pF(q_i^n)]^n < [(1-p)F(q_i^n) + p]^n$$

$$< (1-p)(F(q_i^n))^n + p,$$

where the last inequality follows from the convexity of x^n for x > 0. Thus,

$$a = \lim_{n \to \infty} (\gamma_G^n)^n \leq (1 - p) \lim_{n \to \infty} (F(q_i^n))^n + p = p.$$

Let $\{\delta_n\}$ and $\{\beta_n\}$ be two sequences of numbers belonging to the unit interval and satisfying

$$\gamma_I^n = pF(q_I^n) + (1-p)F(q_I^n) = 1 - \delta_n - \beta_n$$
 (13)

and

$$\gamma_G^n = (1 - p)F(q_I^n) + pF(q_I^n) = 1 - \delta_n \tag{14}$$

for all n. Clearly, $\lim_{n\to\infty} \delta_n = \lim_{n\to\infty} \beta_n = 0$. From equations 13 and 14 we obtain

$$F(q_i^n) = 1 - \delta_n - \frac{p}{2p-1} \beta_n,$$

$$F(q_s^n) = 1 - \delta_n + \frac{1-p}{2p-1} \beta_s$$

Note that $\beta_n < (2p-1)/(1-p) \ \delta_n$, since $F(q_g^n) < 1$. Therefore, for every n,

$$\gamma_I^n > 1 - \delta_n - \frac{2p-1}{1-p} \delta_n = 1 - \frac{p}{1-p} \delta_n$$

which implies $\lim_{n\to\infty} (1-(p/(1-p))\delta_n)^n = 0$. Yet,

$$\lim_{n\to\infty} (\gamma_G^n)^n = \lim_{n\to\infty} \left(1 - \frac{n\delta_n}{n}\right)^n = e^{\ln a}. \tag{15}$$

The sequence of numbers $\{n\delta_n\}$ must be bounded. If not, we could select a subsequence $\{n'\delta_{n'}\}$ such that $n'\delta_{n'} > -2$ ln a for all n'. But this would imply

$$e^{\ln a} = \lim_{n' \to \infty} \left(1 - \frac{n' \delta_{n'}}{n'}\right)^{n'} \le \lim_{n' \to \infty} \left(1 + \frac{2 \ln a}{n'}\right)^{n'} = e^{2 \ln a},$$

which is impossible, since a < 1.

Since the sequence $\{n\delta_n\}$ is bounded, it contains a convergent subsequence, let us say $\{n'\delta_{n'}\}$. It follows from equation 15 that $\lim_{n\to\infty} n'\delta_{n'} = -\ln a$. But this implies

$$\lim_{n'\to\infty}\left(1-\frac{p}{1-p}\frac{n'\delta_{n'}}{n'}\right)^{n'}=e^{(p/(1-p))\ln a}>0,$$

a contradiction. This concludes the proof.

Q.E.D.

Proof of Proposition 3

Since the equilibrium cutpoint associated with signal g is a fixed point of the function v_n , I obtain from equation 12

$$(h(q_{\mathbf{g}}^{\mathbf{n}}))^{n-1} = \left(\frac{p}{1-p}\right) \left(\frac{1}{q_{\mathbf{g}}^{\mathbf{n}}} - 1\right).$$

As q_s^n converges to one, $(h(q_s^n))^{n-1}$ goes to zero. Since h(1) = 1 and h is a continuous function, we have $\lim_{n \to \infty} (h(q_s^n))^n = 0$. I conclude

$$\lim_{n\to\infty} P_n(I|C) = \lim_{n\to\infty} \frac{(h(q_g^n))^n}{1+(h(q_g^n))^n} = 0.$$

Q.E.D.

Proof of Proposition 5

Fix a voting rule $\alpha \in (0, 1)$. I index the equilibrium cutpoints and the ex ante probabilities that a juror votes to convict by the jury size n.

Consider the function $l:[0,1] \to \Re_+$ defined by

$$l(x) := \begin{cases} \left[\frac{(1-p) + p\left(\frac{1-p}{p}\right)^{2}}{p + (1-p)\left(\frac{1-p}{p}\right)^{2}} \right]^{\alpha} & \text{for } x = 0 \\ \frac{[(1-p)F(x) + pF(k(x))]}{pF(x) + (1-p)F(k(x))} \right]^{\alpha} & \text{for } x = 0 \end{cases}$$

$$\cdot \left[\frac{1 - (1-p)F(x) - pF(k(x))}{1 - pF(x) - (1-p)F(k(x))} \right]^{1-\alpha} & \text{for } x \in (0, 1)$$

$$\left[\frac{(1-p) + p\left(\frac{p}{1-p}\right)^{2}}{p + (1-p)\left(\frac{p}{1-p}\right)^{2}} \right]^{1-\alpha} & \text{for } x = 1$$

where the function k is defined in equation 6. I now show that there exists a number \tilde{q} in (0, 1) that satisfies

$$(1-p)F(\bar{q}) + pF(k(\bar{q})) < \alpha < pF(\bar{q}) + (1-p)F(k(\bar{q}))$$

$$(16)$$

and such that

$$l(x) > 1 \quad \text{for } x > \tilde{q}, \tag{17}$$

$$l(x) < 1 \quad \text{for } x < \tilde{q}. \tag{18}$$

The function l is continuous on [0, 1], l(0) < 1 and l(1) > 1. Thus, there exists a value \mathbf{q} in (0, 1) such that $l(\mathbf{q}) = 1$. Note that $x^{\alpha}(1-x)^{1-\alpha}$ is a single-peaked function for $x \in [0, 1]$ with a maximum at $x = \alpha$. Since for any x in (0, 1)

$$(1-p)F(x) + pF(k(x)) < pF(x) + (1-p)F(k(x)),$$
 (19)

it follows that $l(\tilde{q}) = 1$ only if inequality 16 is satisfied. Finally, inequalities 17 and 18 hold since both sides of the inequality 19 are strictly increasing in x.

I now show that any sequence $\{q_g^n\}_{n=2}^{\infty}$ of equilibrium cutoffs associated with signal g converges to \tilde{q} . Note that the function d_n defined by equation 10 can be expressed as

$$d_n(x) = \frac{1}{1 + \left(\frac{1-p}{p}\right) \frac{l(x)^n}{h(x)}},$$

where the function h is defined by equation 11.

Fix $\varepsilon > 0$. Let h_{ε} be the maximum of h on the interval $[\bar{q} + \varepsilon, 1]$. Similarly, let l_{ε} denote the minimum of the function l on the interval $[\bar{q} + \varepsilon, 1]$ (note that both h and l are continuous functions, thus h_{ε} and l_{ε} are well defined). Since $l_{\varepsilon} > 1$ it is possible to find an integer \bar{n} such that $1/[1 + ((1 - p)/p)(l_{\varepsilon}^n/h_{\varepsilon})] < \bar{q} + \varepsilon$ for all $n > \bar{n}$. This implies $d_n(x) < \bar{q} + \varepsilon < x$ for all x in $[\bar{q} + \varepsilon, 1]$ and all $n > \bar{n}$. In a similar way it is possible to prove that given any $\varepsilon > 0$ the fixed point of d_n is larger than $\bar{q} - \varepsilon$ for large values of n (I omit the details). I conclude that $\lim_{n \to \infty} q_n^n = \bar{q}$.

omit the details). I conclude that $\lim_{n\to\infty} q_s^n = q$. For both states of the world the ex ante probability that a juror votes to convict is a continuous function of the cutoff.

$$\tilde{\gamma}_I := \lim_{q \to 0} \gamma_I^q = (1-p)F(\bar{q}) + pF(k(\bar{q})) < \alpha,$$

and

$$\tilde{\gamma}_G := \lim_{n \to \infty} \gamma_G^n = pF(\tilde{q}) + (1-p)F(k(\tilde{q})) > \alpha.$$

By the law of large numbers the share of votes to convict if the defendant is innocent converges in probability to $\tilde{\gamma}_I < \alpha$, so the defendant is acquitted with probability close to one for large values of n. Similarly, if the defendant is guilty the share of votes to convict converges in probability to $\tilde{\gamma}_G > \alpha$, and the defendant is convicted with probability close to one for n sufficiently large.

An Experimental Study of Jury Decision Rules

SERENA GUARNASCHELLI, RICHARD D. McKELVEY, and THOMAS R. PALFREY California Institute of Technology

e present experimental results on groups facing a decision problem analogous to that faced by a jury. We consider three treatment variables: group size (three or six), number of votes needed for conviction (majority or unanimity), and pre-vote deliberation. We find evidence of strategic voting under the unanimity rule: A large fraction of our subjects vote for a decision analogous to conviction even when their private information indicates a state analogous to innocence. This is roughly consistent with the game theoretic predictions of Feddersen and Pesendorfer. Although individual behavior is explained well by the game theoretic model, there are discrepancies at the level of the group decision. Contrary to Feddersen and Pesendorfer, in our experiments there are fewer outcomes analogous to incorrect convictions under unanimity rule than under majority rule. In the case of no deliberation, we simultaneously account for the individual and group data using quantal response equilibrium.

Recent research in political science addresses from a theoretical point of view the question of how individuals behave in juries. The classic Condorcet jury theorem deals with a model in which all jurors have identical preferences (they want to convict the guilty and acquit the innocent) but differ in their probability of making a correct decision. The theorem states that if the jury decision is made by majority rule, then the probability of a correct decision by the group is higher than that of any individual, and the probability of a correct decision goes to one as the size of the jury becomes very large.

Austen-Smith and Banks (1996) challenge the foundations of the Condorcet jury theorem by questioning whether any game theoretic basis can be given for the type of behavior assumed by the theorem. They demonstrate that if individuals start from a common prior about guilt of the defendant and then obtain private information, it is generally not a Nash equilibrium to vote sincerely (i.e., based only on one's private information). Subsequent work by Wit (1996) and McLennan (1996) reestablished that the conclusions of the theorem still hold if individuals vote strategically according to a symmetric mixed strategy equilibrium of the game.

Feddersen and Pesendorfer (1998) analyze the Nash equilibrium of the Condorcet jury theorem, with particular attention to the effect of the decision rule. They compare the unanimous decision rule with rules that require only a majority or supermajority to convict. They conclude that the unanimous rule results in probabilities of convicting an innocent defendant that

are higher than those for majority rule and that do not go to zero as the number of jurors goes to infinity.

The Feddersen and Pesendorfer model assumes that the jury decision is a simultaneous move game, in which all jurors vote without any communication beforehand. As Coughlan (2000) shows, if it is possible to have a straw poll before the vote, then there exist equilibria in which voters reveal their information in the straw poll and vote optimally in the actual vote based on the pooled information from the straw vote. This type of behavior would eliminate the unattractive aspects of unanimity, because decisions under majority rule should be identical to those under unanimity.

There has been relatively little experimental work to investigate the implications of these theories. The one exception is work by Ladha, Miller, and Oppenheimer (1996), who run experiments in which a jury makes a sequence of decisions under majority rule. They find some evidence of strategic behavior and that asymmetric Nash equilibria are sometimes played.

We report here on experiments run to test the Feddersen-Pesendorfer and Coughlan predictions. Our experiments thus consider groups faced with a decision problem isomorphic to the one modeled in those articles. We address the following questions: whether players vote strategically, whether unanimity rule leads to more incorrect convictions than majority rule, how this varies with group size, and whether the effects of a straw poll are the same as those predicted by Coughlan (2000).

As described in detail below, our experiments were conducted using an abstract group decision situation that avoided any direct reference to legal terms like "guilt" or "innocence." Specifically, the experimental implementation of the Feddersen-Pesendorfer jury game was done using colored jars and balls. For each group, the true state of the world (which we analogize here to either "guilty" or "innocent") was determined by randomly assigning the group a red jar (guilty) or a blue jar (innocent) with equal probability. The red jar contained predominantly red balls (guilty signals) and the blue jar contained predominantly blue balls (innocent signals). Before any voting occurred, each subject blindly selected one ball (with replacement) from her

Support from the National Science Foundation (Grant #SBR-9617854) is gratefully acknowledged. We thank Tara Butterfield for research assistance, John Patty for help in running the experiments, and Tim Reed and Charles Smith for writing the computer program for the experiments. We also thank Tim Feddersen, Susanne Lohmann, Krishna Ladha, the audiences at several academic conferences and seminars, three referees, and the Editor for their comments.

group's (randomly assigned) jar. The subject then observed the color of her selected ball, but did not observe the predominant color of the jar from which it was drawn, or the color of the balls selected from the same jar by the other members of the group. Then each group member privately voted for either a red jar (analogous to voting to "convict") or a blue jar (analogous to voting to "acquit"). The votes were then aggregated to form a group decision of red (convict) or blue (acquit) according to the specified voting rule, majority or unanimity. If the group decision matched the color of the group's assigned jar (analogous to convict if guilty, or acquit if innocent), then everyone in the group received a small token payment plus a large prize. If the group decision was incorrect, everyone in the group received only the small token payment. All of this was carefully explained in the instructions, which were read aloud (see Appendix A). We consider the effects of three treatment variables: voting rule (majority or unanimity), group size, and effect of a straw poll. In each treatment we consider individual and group behavior.

In the data, we find clear evidence of strategic behavior that is roughly consistent with the Feddersen-Pesendorfer game theoretic model. That is, a large percentage (between 30% and 50%) of subjects vote red (convict) even when they draw a blue ball (innocent signal). The percentage increases with the group size, as is predicted. Although individual behavior is explained well by the game theoretic model, there are some discrepancies between data and theory at the group level. For example, in our experiments there were fewer decisions analogous to incorrect convictions under unanimity rule than under majority rule, while Nash theory predicts the opposite. In the case of no straw poll, we are able to explain most of these discrepancies, using the logit version of quantal response equilibrium (QRE).

THE CONDORCET JURY MODEL

The Condorcet jury model applies to a general class of group decision problems in which members have a common interest but hold different beliefs about the true state of the world. By a common interest is meant that if the state of the world were common knowledge, then all group members would agree about which decision to make. The differences in beliefs create an information aggregation problem, which creates potential obstacles for the group to reach a consensus and make the "correct" decision. This class of decision problems has application to many settings, including juries in criminal and civil trials, corporate strategy decisions by boards of directors or partners, hiring and tenure decisions by faculty committees, examinations judged subjectively by committees, and so forth. The first of these, trial juries, was the subject of an article by Feddersen and Pesendorfer (1998), which is the main motivation for our work.

Several caveats are in order. First, the model we study applies to a broad class of settings, and it does not capture all the interesting institutional details of a single setting, such as a trial jury. Second, the model is an approximation, and it leaves out some contextual components that may affect behavior in specific applications. Third, it is meant to be simple, so that we can isolate and study certain phenomena of theoretical interest. Fourth, it is flexible, in the sense that one can analyze the model using a wide range of different assumptions about the degree of sophistication or rationality of group members. In this sense, although it is unquestionably a formal theoretical model, it allows one to explore the implications of bounded rationality as well as the implications of rational choice within the confines of the same model. It thus provides a very nice framework for conducting experiments to compare rational choice and bounded rationality.

Model Structure and Notation

We consider a game with a set $N = \{1, 2, ..., n\}$ of n players (e.g., jurors), and let $1 \le k \le n$ represent the number of votes needed for a positive decision (e.g., conviction). The game begins by nature choosing a state of the world in $\Omega = \{G, I\}^1$, with probability s and 1 - s, respectively. The players do not observe the state that is selected, but each obtains some private information about the state. If the true state is G, then each player observes an independent Bernoulli random variable, which is g with probability p and i with probability 1 - p. If the true state is I, then each juror observes an independent Bernoulli random variable, which is i with probability p and g with probability 1 - 1p. After observing their private information, players vote for one of two actions in $X = \{C, A\}^2$ If k or more players vote for C, then the group decision is C; otherwise the decision is A. The utility $u: X \times \Omega \mapsto \Re$ of each player is defined by u(A, I) = u(C, G) = 0, U(C, I) = -q, and U(A, G) = q - 1, where 0 < q < q

In all our experiments, we used the values s = .5, q = .5, and p = .7. We will be concerned with two different voting rules. For the majority rule case, k is the least integer greater than n/2; for the unanimity case, k = n.

We will distinguish between two kinds of behavior, which we call naive and strategic. Naive voters ignore the group strategy aspect of the decision problem and simply vote as if they were the only voter. In the jury setting, that means if they receive a guilty signal they vote to convict, and if they receive an innocent signal they vote to acquit. This is the kind of behavior assumed by Condorcet.

The second kind of behavior is strategic. Contemporary game theorists, including some political scientists (e.g., Austen-Smith and Banks 1996) argue that we should assume individuals behave strategically rather than naively. They also prove formally that naive and strategic behavior can have dramatically different logical implications in the Condorcet jury model. In particular, strategic behavior by jurors is modeled using

¹ Read "G" = Guilty, "T" = Innocent.

² Read "C" = Convict, "A" = Acquit.

	Majority				UnanImIty			
п	$\sigma(g)$	σ(I)	<i>Pr</i> [C /]	Pr[A G]	<u>σ(g)</u>	σ(I)	<i>Pr</i> [C /]	Pr[A G]
3	1.0000	0.0000	.2160	.2160	1.0000	0.3143	.1404	.4989
6	1.0000	0.0000	.0705	.2557	1.0000	0.6511	.1863	.4849
12	1.0000	0.0000	.0386	.1178	1.0000	0.8244	.2073	.4776
24	1.0000	0.0000	.0115	.0314	1.0000	0.9120	.2173	.4740

game theory, which predicts that under certain specific circumstances it is optimal for jurors to vote against their signal. Our predictions about strategic behavior in our experiments are given by the choice probabilities at symmetric Nash equilibria.

We also consider statistical versions of both types of behavior. Since we observe all kinds of choices in our experiment, it is necessary to introduce an error component to individual choices. For the case of naive behavior, we do this by assuming that naive subjects vote with their signal with some fixed probability, γ , and make an error with probability $1 - \gamma$. The probability of correct choice is assumed to be independent of the signal received and the same across all treatments. This becomes a free parameter of the naive behavior model, which allows us to fit the data to the model by standard estimation methods. For the case of strategic behavior, we incorporate the error structure into the equilibrium concept by using QRE. The QRE model (explained in more detail below) assumes that players may deviate with some probability from best responses, and the probability of deviation depends on the expected payoff difference between the best response and the deviation. We use a logit parameterization of QRE that includes a free parameter, \(\lambda \), which determines payoff responsiveness. Higher values of λ in the strategic model correspond approximately to higher values of γ in the naive model.

Strategic Behavior: Nash Equilibrium

To characterize equilibria, a strategy for a voter is a function $\sigma:\{g,i\}\mapsto [0,1]$, taking signals into account in the probability of voting for conviction. There are trivial equilibria to the above game in which voters ignore their information. Of special interest, however, are symmetric "informative" equilibria to the game. Symmetric equilibria require that players with the same signal adopt the same (mixed) strategy. Informative equilibria are those in which the players do not ignore their information.

As shown by Feddersen and Pesendorfer (1998), for the case of unanimity, the unique symmetric informative equilibrium requires that $\sigma(g) = 1$ and that the posterior probability of the defendant actually being guilty conditional on player i receiving an innocent signal and all other players voting guilty must be equal to q. That is,

$$q = \frac{(1-p)g_G^{n-1}}{(1-p)g_G^{n-1} + pg_I^{n-1}},$$

where

$$g_G = p\sigma(g) + (1 - p)\sigma(i) \tag{1}$$

and

$$g_I = (1 - p)\sigma(g) + p\sigma(i)$$
 (2)

are the probabilities that an individual votes to convict when the defendant is guilty or innocent, respectively. Using $\sigma(g) = 1$, this implies that

$$\sigma(i) = \frac{D_n p - (1-p)}{p - D_n (1-p)},$$

where

$$D_{n} = \left(\frac{(1-q)(1-p)}{qp}\right)^{\frac{1}{n-1}}.$$

Also, the probability of an incorrect jury decision to convict the innocent $(Pr[C|I] = (g_I)^n)$ or acquit the guilty $(Pr[A|G] = 1 - (g_G)^n)$ is determined from the above formula. Table 1 gives the equilibrium values of $\sigma(i)$, Pr[A|G], and Pr[C|I], respectively, for unanimity rule for certain values of n.

For majority rule, the formulas are slightly more complicated, but the symmetric equilibrium is simpler, namely, $\sigma(g) = 1.0$ and $\sigma(i) = 0.0$, regardless of the size of n. We can then compute the corresponding probabilities of convicting an innocent defendant: $(Pr[C|I] = \sum_{k>n/2} \binom{n}{k} (1-p)^k p^{n-k})$ and of acquitting a guilty defendant $(Pr[A|G] = \sum_{k \le n/2} \binom{n}{k} p^k (1-p)^{n-k})$. These numbers also are reported in Table 1 for the parameter values used in our experiment.

In the case of a straw poll, the game expands so that the players have two votes. A strategy is now a specification of how to vote in the straw poll, as a function of the player's signal, and then a specification of how to vote in the final vote, as a function of the signal and the observed outcome of the straw poll. Let $\sigma_0: \{g, i\} \mapsto [0, 1]$ be the probability of voting for conviction on the straw poll. Define $N_0 = N \cup \{0\}$ to be the possible outcomes of the poll. Then let $\sigma_1: \{g, i\} \times N_0$. In the case of a straw poll, Coughlan (2000) shows that, for the parameters used here, there is a fully informative equilibrium in which all players reveal their signals on the straw vote, that is, $\sigma_0(i) = 0$, and $\sigma_0(g) = 1$. They then vote based on the majority outcome of the straw

³ This is true for both the case of odd and even n, although it is somewhat more difficult to prove for even n, since the rule is no longer symmetric (n/2 votes to acquit suffice to acquit, but more than n/2 votes to convict are necessary to convict).

poll in the final vote, that is, $\sigma_1(s, M(\sigma_0)) = M(\sigma_0)$ for all signals $s \in \{i, g\}$, where $M(\sigma_0)$ is zero, one, or some appropriate mixing probability according to whether the majority outcome of the straw poll was to convict, acquit, or a tie.

Strategic Behavior: Quantal Response Equilibrium

The above solutions all assume no error. As a general way to incorporate decision error, McKelvey and Palfrey (1995, 1998) propose QRE, which is a statistical version of Nash equilibrium. 4 The basic idea is that it is unreasonable to expect individuals always to behave in perfect accord with rationality and always choose best responses to the other players. Instead, they choose better responses more often than worse responses. QRE is not a deterministic model but instead specifies a probability distribution, $\sigma^*(\cdot)$, over actions. The probabilities are ordered by the expected payoffs of the actions, $EU(\cdot)$, according to some specific function, called a quantal response function, which is just the statistical version of a best response function.⁵ Actions with higher expected payoff will be played more frequently, and actions with lower expected payoffs will be played less frequently. So, for any individual i and any pair of actions available to i, let us say a and b, $\sigma'(a) >$ $\sigma_i^*(b)$ if and only if $EU_i(a) > EU_i(b)$. The "E" of QRE stands for equilibrium, in the sense that the expected payoffs, $EU(\cdot)$, are themselves derived from the equilibrium probabilities, $\sigma^*(\cdot)$. One can think of an iterative process in which a given profile of choice probabilities for all the players' results determines a profile of expected payoffs for every action, which in turn (via the quantal response function) generates a new profile of choice probabilities. A QRE is just a fixed point of this iterative process. QRE retains the rational expectations flavor of a Nash equilibrium but relaxes the assumption that players choose optimal responses.

There are several ways to justify a formal model with the above properties. The idea that individuals choose stochastically rather than deterministically has been proposed for a long time, for example, to motivate reinforcement learning and discrete choice econometrics. Alternatively, one can "rationalize" stochastic choice if players have stochastic utility functions. Harsanyi (1973) proposes a model in this vein: The game payoff matrix is viewed as just an approximation of the utilities of the player over outcomes in the game, and each player's actual utility varies around these means according to some statistical distribution. In a QRE, for every action an individual might choose, there is a privately observed payoff disturbance for that action,

and one then looks at the Bayesian equilibrium to the corresponding game of private information. This is equivalent to smoothing the best response curves of the players and then looking at a fixed point of these smoothed response functions, which is exactly what QRE does.

We focus on a particularly tractable form of QRE, called logit QRE, in which the quantal response functions are logit curves. That is, for any pair of actions a and b, we let $\ln[\sigma(a)/\sigma(b)] = \lambda \cdot [EU(a) - EU(b)]$, where λ is a response parameter.

In our game players have different information and in some cases make a sequence of decisions. Therefore, we turn to the extensive form of the game; we represent profiles of action probabilities as behavior strategies and apply QRE to the "agent" form of this game. Formally, let $p = (p_1, \ldots, p_n)$ be a completely mixed profile of behavior strategies, where $p_i = \{p_{ijk}\}$ and p_{ijk} is the probability that player i, with signal $j \in \{i, g\}$, votes for $k \in \{c, a\}$. Let $\bar{u}_{ijk}(p)$ denote the expected utility to player i from taking action k with signal j, given p. Then p^* is a logit equilibrium if and only if, for all i, j, k,

$$p_{\psi k}^{*} = \frac{e^{-\lambda \mathcal{Q}_{\psi k}(p^{*})}}{\sum_{l} e^{-\lambda \mathcal{Q}_{\psi}(p^{*})}},$$

where again $\lambda > 0$ is a free parameter that determines the slope of players' logit response curves.

As we vary λ from 0 to ∞ , we can map out a family of QREs that correspond to different levels of rationality (or, more precisely, payoff responsiveness). When $\lambda =$ 0, response curves are completely flat, so all strategies are used with equal probability (pure error, or zero rationality). When λ approaches ∞ , logit response curves converge to standard best response curves, so players use only optimal strategies (no error, or perfect rationality). This family of QREs has several interesting properties, which are described by McKelvey and Palfrey (1995, 1998). For example, if we consider a convergent sequence of logit equilibria for a sequence of λ values converging to ∞ , the limit point must be a Nash equilibrium (or sequential equilibrium for extensive form games) of the underlying game. In this sense, Nash equilibrium is just a very special boundary case of QRE, which corresponds to perfect rationality.

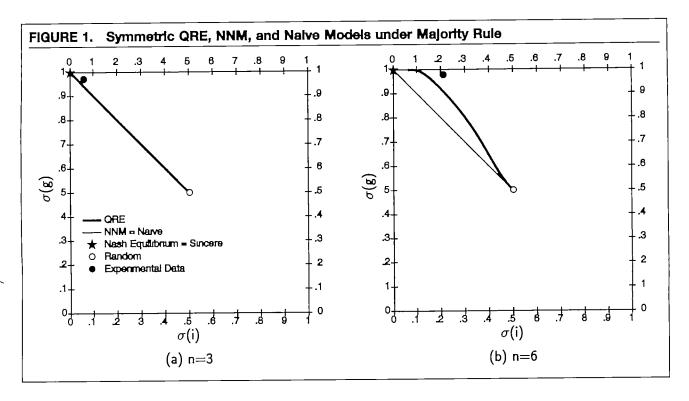

We also consider an alternate model of errors combined with strategic behavior, called the noisy Nash model (NNM), which also looks at statistical variation around the Nash equilibrium but differs from QRE in two ways. First, it does not incorporate the rational expectations assumption of QRE. The NNM model assumes that individuals follow Nash behavior with some fixed probability γ (to be estimated) and choose randomly with probability $1 - \gamma$. Like QRE, in the limiting case when γ approaches 1, the prediction approaches Nash equilibrium. Second, for intermedi-

⁴ See Rosenthal (1989), Chen, Friedman, and Thisse (1977) and Zauner (1999) for alternative formulations of similar ideas. The QRE approach has been used in various applied areas, such as the travelers' dilemma (Capra et al, 1999), all-pay auctions and public goods games (Anderson, Goeree, and Holt 1998a, 1998b), and mternational conflict (Signorino 1999).

⁵ We use a logit specification for the quantal response function, which is explained below

⁶ See McKelvey and Palfrey 1998 for details, where this version is referred to as the AQRE (for agent QRE). We use the notation QRE to refer to this version as well.

⁷ That is, they vote to convict or to acquit with equal probability.

ate values of the error term, the NNM will often differ from QRE. The difference is twofold. (1) NNM assigns the same probability of deviating from Nash equilibrium $(1 - \gamma)$, regardless of the expected utility loss from such a deviation. (2) NNM is not an equilibrium model. Recall that QRE is defined as a fixed point in terms of choice probabilities and logit responses. That is, each player's errors (deviations from Nash play) affect the expected payoffs of all the other players and hence will indirectly affect all other players' logit responses. In contrast, under NNM, there is no such feedback, so that one player's deviation from Nash play has no indirect effect on any other player's deviation from Nash play. See Fey, McKelvey, and Palfrey (1996), McKelvey and Palfrey (1998), McKelvey, Palfrey, and Weber (n.d.), for further discussion of the differences between QRE and NNM. Similar to QRE, we can map out a family of NNM predictions by varying the free parameter γ from 0 to 1.8 When $\gamma = 0$, all strategies are used with equal probability (pure error, or zero rationality). When γ approaches 1, predictions of NNM converge to Nash equilibrium.

In figures 1 and 2, the symmetric portion of the logit QRE correspondence for jury sizes n = 3 and n = 6 and both the majority and unanimity voting rules are displayed as the thick solid curves. Each graph is on the unit square of mixed behavior strategies of a representative player. The horizontal and vertical axes of each graph correspond to the probability of voting to convict, given innocent and guilty signals, respectively. At the center of each unit square is the "pure error"

logit equilibrium that corresponds to $\lambda=0$. As λ increases, the equilibrium curves converge to the symmetric Nash equilibrium, which is on the upper boundary of the unit square (the upper left corner, in the case of majority rule).

In a similar fashion, one constructs the correspondences defined by the NNM model and the naive (nonstrategic) model by varying γ between 0 and 1. Referring to figures 1 and 2, the NNM correspondence is simply the line segment that connects the center of the probability square (pure error) to the symmetric Nash equilibrium. The naive model correspondence is the dashed line segment that connects the center to the upper left corner of the strategy space. This vertex corresponds to "honest" voting.

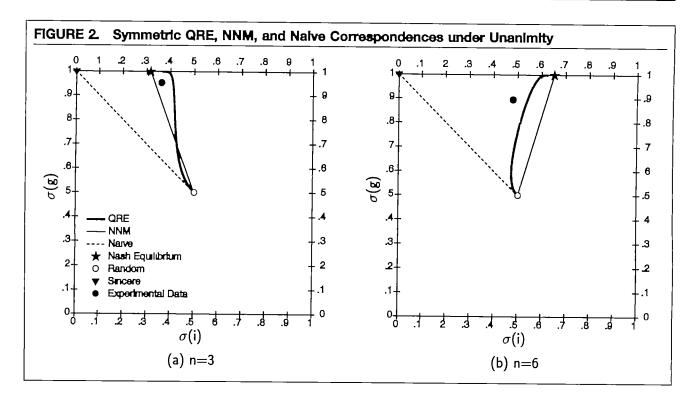

In Appendix B we fully characterize and compute the symmetric quantal response equilibrium correspondence for the three-person unanimous jury game with a straw vote. The characterization of the majority rule QRE correspondence is similar and is not included in the appendix. Our efforts to compute the symmetric quantal response equilibrium correspondence for majority rule juries with a straw vote were unsuccessful. Also, we found that the six-person jury game with a straw vote is too complex to compute the QRE correspondence, using our numerical methods.

EXPERIMENTAL DESIGN

We conducted four experiments with undergraduate and graduate students at the California Institute of Technology. Each experiment had twelve subjects (plus one subject who was used as a monitor). Each experiment had four sessions. Between sessions, two treatment variables were altered: the decision rule (majority or unanimity) and the straw poll (taken or not). The

As with QRE, we limit attention to the NNM corresponding to the symmetric mixed strategy Nash equilibrium.

⁵ Later we present and discuss the asymmetric components of this correspondence. The large dots in the figures are explained in the data analysis section.

treatment variables were manipulated according to the design in Table 2, which gives the particulars of each experiment. In each session, subjects participated in a sequence of fifteen "matches." In each match the subjects were randomly divided into groups of size n, where n was one of the treatment variables, and a game similar to that described in the previous section was conducted. In Table 2, the values of each treatment variable are given per session. For example, U/N (15) means 15 matches with the unanimity decision rule and no straw poll. All matches in the same experiment were run with the same number of subjects.

Subjects were not told that the experiment was intended to represent a jury decision. The states of the world were called the red jar and blue jar instead of guilty and innocent, and rather than a choice between convict or acquit, the subjects were instructed to guess whether the true jar was red or blue. The complete instructions are given in Appendix A.

Briefly, each match proceeded as follows. Subjects were told that there were two jars, a red one and a blue one. The red jar contained seven red balls and three blue; the blue jar contained seven blue balls and three red. One of the jars was selected for each group, as determined by the roll of a die by the monitor (a subject chosen at random from the group at the beginning of the experiment). ¹¹ The subjects were not told which jar had been selected, but they were each allowed to choose one ball at random from the jar. ¹²

They then voted for either the red jar or the blue jar. Two decision rules were investigated: majority rule and unanimity. The decision rule, which was explained to them before the session, was used to determine the group decision, and payoffs were based on whether the group decision was correct or incorrect. Each subject received fifty cents if the group decision was correct, five cents if incorrect. Subjects were paid in cash at the end of the experiment, plus a "show up fee" of \$5.

RESULTS

Jury Behavior without Deliberation

The first two columns of Table 3 show the realizations of the voter strategies in the case of no straw poll. As discussed in the previous section, our experiment was run with colored jars and balls to represent states of the world and evidence. We frequently interpret the results of the experiment, however, in terms of the underlying jury problem that the experiment represents. Thus, a red jar represents guilt, and a blue jar represents innocence. A red ball is evidence for guilt and a blue ball is evidence for innocence. A vote for the red jar represents a vote to convict and a vote for the blue jar is a vote to acquit. The columns of Table 3 and of subsequent tables are labeled to reflect this correspondence.

The data support our predictions for both the ma-

this procedure was conducted honestly, before the experiment we generated the order of the samples for each match, each group, each possible state, and each subject. The samples in the experiment were generated according to this list. Subjects recorded which ball they selected in each match, and they were free to peruse the list after the match to verify that the correct number of balls of each color were present, and that the ball they selected was of the correct color.

¹⁰ The last three sessions of experiment CJ1 were truncated to ten matches each, due to one particularly slow subject

¹¹ The die was rolled once for each group in each match, so in each match, different groups could have different states.

¹² This was accomplished by placing the balls in random order on their computer screen, with the colors hidden. Subjects then used the mouse to select one ball and reveal its color. To convince them that

jority rule treatment and the unanimity treatment. Under majority rule, the subjects voted the same direction as their signals more than 94% of the time; the only exception corresponds to the analogous case of innocent signals in a six-member jury, in which case the subjects erred 21% of the time. This seems like a surprising result but can be explained by the fact that the Nash equilibrium in the six-person majority rule experiments is weak. In the symmetric equilibrium of that game, jurors who receive innocent (blue) signals are indifferent between voting to acquit and voting to convict. In the QRE, this indifference leads to a prediction that players with innocent (blue) signals will vote against their signal more frequently than players with guilty (red) signals, for every positive value of λ .

In the case of unanimity, jurors with a red (guilty) signal tend to vote with the signal—strongly so for groups of three, less strongly for groups of six. However, when they got a blue (innocent) signal, 36% of subjects voted red (to convict) in the three-person groups, 48% did so in the six-person groups. For the three-person groups, this is very close to the Nash predicted value of .314. For the six-person groups, the rate is significantly below the predicted value of .651.

Since the Nash equilibrium of the game requires that in some cases a pure strategy is adopted, any observations in which subjects do not follow that strategy are enough to reject statistically the Nash equilibrium as a model of behavior. Thus, any game theoretic framework that explains the data must incorporate a model of the error source. Earlier, we proposed three alternatives that incorporate error: naive (nonstrategic), logit QRE, and NNM.

Table 4 gives the results of estimating the free parameters in these three models. Because of the symmetry of the game, all three make identical predictions for the three-person majority rule case. Also, the aggregate choice frequencies from all the nondeliberation data are superimposed (large dots) in figures 1 and 2. The first (and perhaps most important) thing to

observe is that the naive model does very poorly. In other words, voters are behaving as if they understand the strategic subtleties of the decision problem. For the NNM model we estimate γ to be in the 0.90 to 0.93 range for three-person groups. Since $(1 - \gamma)$ is the probability of choosing randomly, this corresponds to an error rate of less than 5%. For six-person groups, we estimate γ to be in the 0.75 to 0.78 range, which corresponds to an error rate slightly greater than 10%. For this size group, the QRE fits significantly better than the NNM under both majority and unanimity rules. In the case of three-person groups under unanimity, the fits of QRE and NNM are almost identical, with no significant difference between the two. The naive model is rejected in favor of the QRE for all treatments in which the two models make distinct predictions.

Group Behavior with Deliberation

As is evident from Table 3, in the case of a straw poll, the final vote cannot be predicted very well using the equilibrium of the Feddersen and Pesendorfer model. On average, subjects voted against a red (guilty) signal about 15% of the time, independent of group size or voting rule. With a blue (innocent) signal, between 16% and 37% vote to convict against their signal depending on the treatment. This is a higher rate of voting against signal than for those who obtain a red (guilty) signal, but we do not get differences as large as those between majority rule and unanimity as in the case of no straw poll.

Table 5 presents the results of the straw poll sessions based on the Coughlan equilibrium, which predicts that subjects will reveal their signal in the straw poll and then base their vote in the final round on the majority outcome of the straw poll. For the most part, the subjects do use the straw poll to reveal their signal. More than 90% in every cell (except 89.7% in one cell) revealed their signal in the straw poll. Of some interest

is the additional finding that voting against innocent signals occurs with about twice the frequency of voting against guilty signals in all four treatments.

In the final vote, when the outcome of the straw poll is not a tie, under all treatments players vote with the public signal at least 83% of the time. One might expect the proportion to be higher. In an equilibrium of the Coughlan type, individuals in the final vote should ignore their own signal and only pay attention to the public signal. Table 6 gives the result of a probit analysis of the final vote by the individual's private signal and the publicly available information. For public information, we use the number of other individuals who voted red (to convict) in the straw poll plus the information of the individual (1 for a red [guilty] signal, 0 for a blue [innocent] signal). If voters are following the Coughlan equilibrium, then they should base their vote on the public information and ignore their private signal. The probit analysis indicates that this is not the case. The individual's private information has a significant effect on the final vote for all combinations of treatment variables.

We believe there are several reasons the straw poll does not work exactly as predicted by Coughlan (2000). The simplest explanation is based on the results of the treatment without a straw poll. Even in the simplest group—three-person majority rule—some players fail to vote sincerely. This source of error causes a small effect if there is no straw poll, and the QRE discussion in the last section showed how these small effects can be accounted for using an equilibrium model with

errors. With a straw poll, the relatively small effects of errors in the initial voting stage become compounded in the second stage, since the noisy behavior in the straw poll means that individuals are not sure how to interpret the poll results. If they believe there is some likelihood that others will not perfectly follow the first-stage equilibrium, then they *should* give some weight to their own private information in the second stage. This has a snowball effect on straw poll behavior, because they know that others will be uncertain how to interpret the straw vote. Since QRE is an equilibrium model, it can capture this effect of compounding errors.

Appendix B presents a QRE analysis of the straw vote game for the three-person unanimity treatment, including a table that presents the maximum likelihood estimates of λ and γ . Our computational algorithm failed to converge in its computation of the QRE correspondence for the majority rule game or the six-person games. The main findings are summarized as follows, and a more detailed account is contained in Appendix B.

There are several important features of the QRE correspondence. First, for higher values of λ , there are multiple symmetric equilibria that correspond to the various Nash equilibria. Second, the graph is not well behaved, as it contains two points of bifurcation. Third, one of the branches corresponds to the informative equilibrium studied by Coughlan (2000), and it is the component of the QRE correspondence that most closely matches the data. Fourth, this component has the feature that voters condition their final vote on

TABLE 5. Voting with a Straw Poli: Proportion Voting to Convict by Prior Information (Straw Vote by Signal, and Final Vote by Straw Poli Result)

their own signal as well as the vote outcome in the final round. In particular, in the jury setting, for any fixed number of votes to convict in the straw vote, the probability of voting to convict in the final stage is higher if one observes a guilty signal than if one observes an innocent signal. Fifth, the probability of voting to convict in the final vote is monotonic in the number of straw votes to convict.

These features of the QRE are consistent with the data and with the simple probit analysis of Table 6. Yet, although the main qualitative predictions of QRE are found in the data, the quantitative fit is less successful. In fact, the maximum likelihood fit of the NNM is better than the fit of the QRE model. Further details and discussion are in Appendix B.

Group Decision Accuracy

Table 7 summarizes the accuracy of the final decision as a function of the experimental treatment variables. We compare the actual data with the Nash equilibrium predictions of error rates, given in Table 1. First, in the experimental data with no straw poll, under unanimity the probability of voting incorrectly when the true state is blue (to convict an innocent defendant) decreases from .190 to .029 in our data as the group becomes larger (this difference is significant at the .05 level using a difference of proportion test, with t=2.223). The Nash theory predicts the opposite (from .14 to .19). Furthermore, in the blue (innocent) state, the error rate for six-person unanimous groups is lower than the error rate for majority groups (.03 vs. .30). This differ-

ence (significant at the .01 level, t=2.924) is also counter to the Nash theory. As for majority rule groups, error rates decline with larger size in the true red (guilty) state and increase with larger size in the blue (innocent) state. This is exactly the opposite of what is predicted in the Nash equilibrium.

We view the contradictions with the aggregate theoretical predictions as surprising, especially because the individual choice frequencies are not very different from the theoretical levels. We interpret this to mean that the accuracy of group decisions is not a robust phenomenon. That is, small changes in individual choice behavior can result in large changes in the probability of an erroneous group judgment. This is especially true for unanimity rule, where our data suggest that a small amount of individual decision error can produce a much larger number of "acquittals" than is predicted by the Nash equilibrium.

As evidence in support of this claim, we also computed expected group accuracy under the QRE model. To compute these values, we used the maximum likelihood QRE estimates of $\sigma(i)$ and $\sigma(g)$ from Table 4 and substituted into equations 1 and 2 to get values of g_G and g_I . Then the probabilities P(C|I) and P(A|G) were computed by the corresponding binomial formulas used in Table 1. We see that the accuracy implications of the QRE estimates match the data better than the Nash predictions. All the above discrepancies between the data and the Nash predictions except one are resolved by the QRE predicts that, under unanimity, the probability of convicting an inno-

Oracilling	6	.029 (34)	.186	.069	.731 (26)	.485	.772	.107 (28)	.071	437 (32)	.256

cent defendant should decrease (from .19 to .07) as the size of the jury increases. This is consistent with the data.

The experiments with a straw poll suggest that the poll increases the accuracy of judgments in the guilty state but has essentially no effect in the innocent state. In a jury setting, it appears that the probability of convicting the innocent does not increase with deliberation, but the probability of acquitting the guilty declines substantially. In this case we can compute the Nash predictions. With a straw vote, the fully informed Nash equilibrium predicts that both majority and unanimous juries of the same size should have identical accuracy. This is true since the equilibrium strategy is to reveal individual signals in the straw poll, and then vote on the final ballot based on whether the number of reported guilty signals exceeds $\frac{\pi}{2}$.

Group Accuracy In the QRE

As pointed out earlier, Feddersen and Pesendorfer (1998) imply that large unanimous juries will convict innocent defendants with fairly high probability, whereas the likelihood of such errors in large majority juries will vanish. Even in juries of six, the probability of convicting the innocent is predicted to be higher with unanimity rule than with majority rule. This did not happen in our experiment. We found in both the three- and six-person groups that errors of this kind are more prevalent with majority than with unanimity rules.

We now show that our empirical findings are consistent with the logit equilibrium. Specifically, for any logit parameter of $\lambda < \infty$, the probability of conviction goes to zero in large unanimous juries. In contrast, for any $\lambda > 0$, the probability of a majority-rule error in the symmetric informative logit QRE goes to 0 as jury size increases, regardless of the state of the world. We first show that the probability of an individual innocent vote in a logit QRE is bounded below by an expression that is independent of n.

Theorem 1. Fix $\lambda < \infty$. For every $\delta > 0$, there exists N (δ , λ), such that for all n > N (δ , λ) the probability of acquittal in any logit QRE is greater than $1 - \delta$, regardless of whether the defendant is innocent or guilty.

Proof. Writing p_{iga}^* and p_{igc}^* for the probability that an individual votes to acquit or convict, respectively, with a guilty signal, it follows that in any logit QRE,

$$p^*_{\frac{1}{2^{n}}} = \frac{1}{1 + e^{\lambda [\frac{n}{2^{n}}(p^*) - \frac{n}{2^{n}}(p^*)]}} > \frac{1}{1 + e^{\lambda}},$$

since $\bar{u}_{ige}(p^*) - \bar{u}_{ige}(p^*) < 1$. A similar argument establishes that $p_{ua}^* > 1/1 + e^{\lambda}$.

The theorem now follows immediately, because the lower bound on both p_{iga} and p_{iia} is independent of n. Q.E.D.

THEOREM 2. Fix $\lambda < \infty$, and consider the logit QRE of the unanimous jury game with a straw poll. For every $\delta > 0$, there exists N (δ, λ) , such that for all $n > N(\delta, \lambda)$ the

probability of acquittal is greater than $1 - \delta$, regardless of whether the defendant is innocent or guilty.

Proof. The argument from the previous theorem applies to the final stage of the straw poll in exactly the same way as it applies to the case with no straw poll. Therefore, the lower bound on p_{iga} and p_{iia} identified in the previous theorem is the same and is independent of n. The result follows immediately.

Q.E.D.

We see that (logit) QRE behavior is entirely consistent with the traditional jurisprudential theory that argues for unanimous juries as a protection against conviction of the innocent. The reason is that the Nash equilibrium conviction/acquittal probabilities are not robust to decision errors. In order for the probability of convicting the innocent to increase, the probability of voting to acquit must go to zero extremely fast in the number of jurors (on the order of 1/n), since the probability of conviction is equal to $(1 - p_{10}^*)^n$. When the probability of voting to acquit goes to 0 any slower than this, defendants will always be acquitted by large juries. That is, unanimous juries will become completely uninformative.

In our unanimity rule data, we found two interesting results that are relevant to the jury setting. First, both with and without straw polls, the innocent are wrongly convicted less frequently by large juries than small juries. Second, both with and without straw polls, the probability of acquitting the guilty increases with n. Both of these findings are the opposite of what Nash theory predicts, but they are consistent with the logit QRE, which predicts that unanimous juries will become more heavily biased toward acquittal as their size increases. Under majority rule this acquittal bias does not occur, but at the nontrivial cost of roughly 50% higher wrongful conviction rates of innocent defendants.

Individual Behavior, Heterogeneity, and Asymmetric Equilibria

The theoretical work underlying this experiment focuses entirely on symmetric informative equilibria. As was noted in passing, there are many equilibria in these voting games, all of which satisfy standard refinement criteria, such as perfection, properness, and stability. We now investigate whether our data can be interpreted as evidence either for uninformative equilibria or for asymmetric equilibria.

There is clear evidence against uninformative equilibria. The unique uninformative equilibrium for the unanimity game has all players always voting to acquit, independent of their actual signal. In contrast, Table 7 clearly showed that voting is very informative in the unanimity games, with and without straw polls. We conclude that our data do not provide evidence of uninformative equilibria.

The issue of asymmetric equilibria is both more subtle and more problematic. A necessary condition for asymmetric equilibria is some evidence of heterogeneity in the observed decision rules of different players within the same treatment. We find strong evidence for heterogene-

TABLE 8. Breakdown of Strategy Types in Unanimous Juries without Deliberation (Innocent Signals Only) Session 4 Total 2 3 1 Strategy Type 0 (0/0) 11 (0/93) 3 (0/27) 4 (0/31) 4 (0/35) 1: Sincere 10 (32/75) 28 (95/213) 6 (19/41) 7 (24/57) 5 (20/40) 2: Mlxer 3 (23/23) 9 (61/61) 2 (15/15) 3(18/18)1(5/5)Convicter Note: (Guilty Votes/Innocent Signals) is in parentheses

ity in our data. As a simple way to categorize behavior, we divide players into three strategy types, based on how analogous jurors would vote when they receive an innocent signal. Strategy type 1 always votes sincerely, that is, $\sigma(i) = 0$. We call these honest voters "sincere." Strategy type 2 mixes when an innocent signal is received, that is, $\sigma(i) > 0$. We call these voters "mixers." Strategy type 3 always votes to convict, independent of the signal, that is, $\sigma(i) = 1$. We call these voters "convicters." To implement this classification, we use frequency of choices.

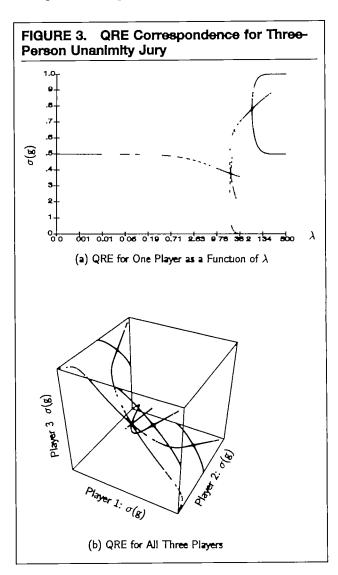

Table 8 presents the breakdown of strategy types by session. Overall, 23% of the voters are always sincere, 58% mix, and 19% always vote to convict.

The numbers in parentheses indicate the number of guilty votes and the total number of innocent signals observed by all voters classified in that cell. For example, in session 1, in the unanimity/no-deliberation treatment, four subjects always voted sincerely when they received an innocent signal. They received a total of 31 innocent signals and voted to acquit in every instance. In that same session, seven subjects mixed, that is, they neither always voted to acquit nor always voted to convict when they received an innocent signal. They received a total of 57 innocent signals and voted to convict 24 times.

To illustrate the range of possible asymmetric equilibria in jury games, consider the simplest case of three-person juror unanimity juries with no deliberation. In this case there is an equilibrium with two convicter types and one sincere voter. To see that this is an equilibrium, first look at the convicters. Either of them is pivotal if and only if the sincere player votes to convict, which happens only if she receives a guilty signal. Thus the best response is to vote to convict with a guilty signal and to vote either to convict or to acquit (indifferent) with an innocent signal. For the sincere voter, since the other two players are always voting to convict, conditioning on being pivotal is uninformative, so sincere behavior is strictly optimal for either signal. Using similar reasoning, one can easily show that for any probability $p \in [0, 1]$, there is an equilibrium in which one sincere voter, one punitive, and one mixer will vote to convict with a innocent signal with probability p (and always vote to convict with a guilty signal). An even wider range of asymmetric equilibria exist with six-person juries. Ladha (1998) has shown that the pure strategy asymmetric Nash equilibria maximize the accuracy of information aggregation in jury games.

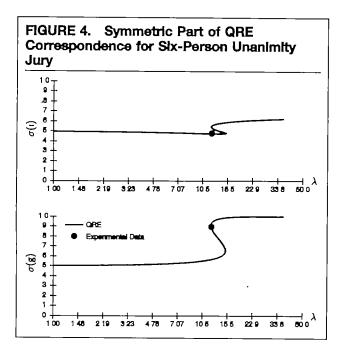

We have not fully characterized the asymmetric equilibria, but the point is clear. There are lots of equilibria, so the empirical restrictions of equilibrium behavior are limited. But we point out that in all these equilibria for three-person juries, the aggregate probability of a vote to convict, given an innocent signal, is above one in three.

The issue of asymmetric equilibria is further complicated if one takes into account the possibility that subjects may make errors. In Figure 3 we plot the full QRE correspondence for the three-person unanimity game under the assumption that iteratively dominated strategies are not played (i.e., a player who receives a

¹³ Since nearly all jurors always vote to convict with a guilty signal, we do not break down the individual strategy types based on that.

¹⁴ There are no voters who always vote to acquit.

guilty signal always votes guilty). Even under this assumption, it is evident from the figure that the full QRE correspondence is quite complicated. First, it bifurcates in several places. This is not a generic feature of the QRE correspondence, and it happens here because the game is symmetric and hence is not generic. In generic games, as shown by McKelvey and Palfrey (1995, 1998), the principal branch of the ORE correspondence selects a unique equilibrium (i.e., there is no bifurcation). For nongeneric games, such as these jury games, such a selection is no longer possible. In this case, the forks or bifurcations in the QRE correspondence are places where the equilibrium correspondence branches to connect to the asymmetric equilibria. Thus, if we drop the focus on asymmetric equilibria, the QRE gives no guidance as to which asymmetric equilibrium should be selected. Second, if subjects make errors, then in addition to the limiting points of the correspondence, one predicts that other points on the correspondence could occur. If there is a failure to coordinate on any equilibrium, then matters are further complicated.

Figure 3 deals only with the three-person jury. For the case of a six-person jury, matters become even more complicated and there are too many parameters to solve. Figure 4 plots the symmetric part of the QRE correspondence for a six-person jury using the unanimity rule. This graph is the same as in Figure 2 but is viewed from a different projection into the coordinate axes. In this view, we see that even the principal branch of the symmetric part of the QRE correspondence is not monotonic in λ. Thus, if one follows the principal branch of the QRE starting at $\lambda = 0$, one reaches a point (at about $\lambda = 15$) where the curve bends backward for a while. In this region, the symmetric branch of the QRE is multiple valued. For the six-person case, we have not been able to compute the full QRE correspondence that would include the asymmetric QRE. But since there is no unique selection of a

symmetric QRE for some values of λ , this may even increase the probability of a lack of coordination as well as the tendency toward asymmetric behavior.

LEARNING

The game we implemented in the laboratory is complicated. We asked subjects to make choices based on limited partial information in an uncertain environment with asymmetric information. They were not guided by any clues that would make it easy to connect the group decision problem they were solving to reallife situations that they have experienced. This was intentional, since we did not wish to bias their decisions or distort their induced preferences in ways that are difficult to predict or measure. Furthermore, in order to make the most of this information, they needed to anticipate how other subjects in the room would make decisions based on their (different) partial information.

Given the complexity of the task, we expected to find trends in the data. For example, the concept of conditioning a decision on the event that one's vote is pivotal is a very subtle notion, yet that is the main idea underlying the equilibrium of these games. It is conceivable that in early rounds subjects are less aware of this equilibrium effect and experience is required before it affects their decision making. The difficulty of the task was one factor that motivated the repeated trials feature of our design.

For the majority rule experiments, the aggregate data are a close match to the equilibrium prediction that voters will be sincere. This is not surprising, since the simple intuitive rule of voting sincerely corresponds to the optimal decision rule when one conditions on being pivotal. In six-person groups with majority rule, we found significantly more deviation from sincere voting, but this can be explained by the fact that voting sincerely is only a weak equilibrium in a group that size. That is, with a blue (innocent) signal, a voter is indifferent between voting red (guilty) and voting blue (innocent).

To test whether the observed phenomenon of strategic voting was partly the result of learning, we focus on the decisions by voters with blue (innocent) signals in the unanimity treatments with no straw poll. This was the only case in our experiment in which players are predicted to vote against their signal in the Nash equilibrium. For these voters, we compared the frequency of voting against their blue signal (to convict) for the first five rounds of data and the last five rounds of data. In all four sessions, the frequency of voting red (guilty) with a blue (innocent) signal in the last five rounds was higher than in the first five rounds and was closer to the Nash equilibrium prediction.

As expected, the time trend data from other voter types in other treatments do not show much of a pattern. Breaking the data down by session, treatment, and signal (a total of 28 cases), we found that in 61% of the cases the decision frequencies moved closer to the Nash equilibrium or remained constant in the later periods, ¹⁵ whereas in 54% of the cases the decision

¹⁵ In all but one of the cases in which there was no change between

frequencies were farther from the Nash equilibrium in the later periods.

CONCLUSION

Our experiments reveal a definite tendency to vote strategically in the case of a unanimous rule and no straw vote. In three-person groups more than one-third of the time players with blue (innocent) signals voted against this signal, which is very close to the Nash equilibrium prediction. In six-person groups, this frequency increased significantly, also as predicted by the theory, but the increase was not as great as Nash equilibrium predicts.

Individual behavior is explained well by the game theoretic model, but at the level of group decisions, there are numerous discrepancies. In particular, contrary to Feddersen and Pesendorfer (1998), in our experiments there were fewer decisions analogous to incorrect conviction under unanimity rule than under majority rule, and larger juries may convict fewer innocent defendants than smaller juries under unanimity. We simultaneously accounted for the individual and group data by using quantal response equilibrium to model the error.

Our study suggests that during deliberation, which we implemented experimentally with nonbinding straw polls, voters tend to reveal their signals but not to the full extent predicted by the theory. Most of them then use the public information to make their final vote. Thus, the introduction of straw polls largely (but not completely) eliminates strategic voting by juries in the case of the unanimity rule. Surprisingly, straw polls may lead to more strategic voting under the majority rule. The fact that there is a residual of strategic revelation even with straw polls results in some departure from the "sincere" equilibrium path of the final stage. As expected, it appears that straw polls increase the frequency with which juries make correct decisions in the case of a guilty defendant.

APPENDIX A: EXPERIMENT INSTRUCTIONS

Decision-Making Experiment (Condorcet Jury)

This is an experiment in group decision making, and you will be paid for your participation in cash, at the end of the experiment. Different subjects may earn different amounts. What you earn depends partly on your decisions, partly on the decisions of others, and partly on chance.

The entire experiment will take place through computer terminals, and all interaction between you will take place through the computers. It is important that you not talk or in any way try to communicate with other subjects during the

We will start with a brief instruction period. During the instruction period, you will be given a complete description of the experiment and will be shown how to use the computers. If you have any questions during the instruction period, raise

the first and last periods, all the early data are exactly at the Nash equilibrium.

your hand, and your question will be answered so everyone can hear. If any difficulties arise after the experiment has begun, raise your hand, and an experimenter will come and assist you.

In this experiment, one subject will act as a monitor. The monitor will be paid a fixed amount (\$20.00) for the experiment. The monitor will assist in running the experiment by generating random numbers for use in the experiment, and serving as someone who can check that the experiment is run correctly. We will select the monitor by having you each select an envelope. Open your envelope, and read the card inside to determine if you are the monitor.

[PASS OUT ENVELOPES]

Will the monitor please go to the master computer, and we will now pass out record sheets to the subjects in the experiments.

PASS OUT RECORD SHEETS

Please put your name at the top of the record sheet. The experiment you are participating in is broken down into 4 separate sessions. Each session will consist of 15 matches. At the end of the last match of the last session, you will be paid the total amount you have accumulated during the course of the 4 sessions. Everyone will be paid in private, and you are under no obligation to tell others how much you earned. Your earnings are denominated in francs. 16 Your dollar earnings are determined by multiplying your earning in francs by a conversion rate. In this experiment, the conversion rate is .005, meaning that 100 francs is worth 50 cents.

We will now begin the computer instructions for the first session. We will teach you about the experiment and how to use the computer by going through a short practice match. During the instruction session, do not hit any keys until you are told to do so, and when you are told to enter information, type exactly what you are told to type. You are not paid for the practice match.

START JURY PROGRAM

When the computer prompts you for your name, type your full name. Then hit the ENTER key, and confirm by typing Y.

First Screen

You now see the first screen of the experiment. At the top center of the screen, you see your subject number. Please record that on your record sheet now. This session consists of 15 matches. In each match, you will be matched with another group of subjects. Your group number and the number of subjects you are matched with is on the top right side of your screen. In this session, each of you is matched with two other subjects, in groups of size 3.

There are two jars, which we call the red jar and the blue jar. The red jar contains 7 red balls and 3 blue balls. The blue jar contains 7 blue balls and 3 red balls. At the beginning of the match, we will randomly choose one of the two jars for your group. This will be done by the monitor, who will roll a die to determine the color. If an odd number is rolled, the jar will be blue; if an even number is rolled, the jar will be red. Different groups may have different colors. You will not be told which jar has been chosen. You may now press a key to advance to the next screen.

¹⁶ The use of francs (or some other form of artificial currency) is common in experimental work, and is done primarily to allow for calibration of total payout via adjusting the exchange rate rather than adjusting the payments on the payoff tables viewed by the subject. This allows numbers in the payoff tables to be in whole numbers and avoids the use of decimals.

Second Screen

To help you determine which jar has been selected for your group, each member of your group will be allowed to select one ball, at random, from the jar. This is done on the computer by randomly ordering the balls in the jar for each subject, but leaving the colors hidden. You can then use the mouse to click on one of ten balls. When you select a ball, its color will be revealed to you and displayed on your screen, and you must record this information on your record sheet. This is called your "Sample." You are not told the colors of the sample balls drawn by the other members of your group. Note that the balls are numbered. This is just so that you can remember and record which ball you selected.

Each subject in your group selects a ball on their own, and only sees their own sample ball. The balls are ordered differently for each subject. However, all the members of your group have the same number of red and blue balls. That is, if the true color of the jar for your group were red, then all members of your group are drawing their sample balls from a list containing 7 red and 3 blue balls. If the true color of your group's jar is blue, then all members of your group would be drawing their sample balls from a list containing 3 red and 7 blue balls. Please select a ball now, and record its color and number on your record sheet. When you have finished recording, press a key to continue.

Third Screen

After everyone has drawn the sample, you will be asked to vote for either a red jar or a blue jar.

[READ EITHER A OR B]

- A Unanimity instructions: If (and only if) everyone in your group votes red, your group decision is red. Otherwise, your group decision is blue. That is, if anyone in your group votes blue, the group decision is blue.
- B Majority rule instructions: If a majority (two or more) of your group votes red, then the group decision is red. Otherwise, your group decision is blue. That is, your group's decision will be whichever color receives more votes.

The table on this screen tells you your payoffs. If your group's decision is the same as the true color, then the decision is correct, and each member of your group earns 100 francs. If your group decision is different from the true color of the jar, then the group decision is incorrect, and each member of the group earns 10 francs. You may vote by selecting, with your mouse, either the red or the blue jar and then confirming. In the actual experiment, you may vote however you like. In the practice match, please vote red if you are on the left side of the room, and blue if you are on the right side of the room. Please vote now.

Fourth Screen

After everyone has voted, the vote is tallied, and you and the others in your group will be told what the result of the vote was, and what the true color of the jar for your group was. Please hit a key to proceed.

Fifth Screen

After all decisions have been made, you are given a summary of the decisions up to now. Please record this information on your record sheet. This marks the end of the match. After you have recorded all of the information, please hit a key to continue.

Sixth Screen—Display Overhead

We will now illustrate in more detail how the sample is drawn. Your computer screen now shows the balls you drew your sample from with all of the colors revealed. The ball that you drew is outlined with a white box.

Prior to the experiment, all of the lists of sample balls for each subject, and each match, and each possible true jar color have been generated by a random number generator. We have a printout of this information that will be available to the monitor. You now see on the overhead projector screen a copy of the first page of this data, which is for the practice match. Find your subject number and the true color of your group's jar. Compare the display on your computer screen to that on the overhead projector. The color of the balls should be identical. Please look at the overhead projector screen. Note also that the ordering of the balls for all subjects is different, even if they are drawing from the same jar.

During the actual experiment, you will not be shown this screen. However, your samples will be done in exactly the same way. We have printed out the similar sheet for all of the matches to follow. If you record the number of the ball that you drew each match, then at the end of the experiment, if you wish, you may ask the monitor to check your sample against this sheet to verify that the ball you selected was the correct color.

After a match is over, and everyone has recorded the information about their match, you will be randomly rematched into another group consisting of different subjects. A new jar will be randomly drawn for your group, you will get a new sample from a jar of the group color, you will vote, and a group decision will be determined as described above. After we have finished 15 matches in this manner, the first session of the experiment will be over, and we will give you instructions for the next session.

Are there any questions before we begin with the actual experiment?

[EXPERIMENTER TAKES QUESTIONS]

We will now begin with the actual experiment. If there are any problems from this point on, raise your hand, and an experimenter will come and assist you.

[START EXPERIMENT]

Rules for Experiment Session #2

This experiment session will also last for 15 matches. The rules are the same as in the first session, with one exception.

[READ A OR B]

- A Recall that in the previous session, your group decision was red if and only if all three members of your group voted red. Otherwise your group decision was blue. In this session there will be a slight change in the voting rule. Now, if a majority (two or more) of your group votes red, then the group decision is red. Otherwise, your group decision is blue. That is, your group's decision will be whichever color receives more votes.
- B Recall that in the previous session, your group decision was red if two or more members of your group voted red. Otherwise your group decision was blue. In this session there will be a slight change in the voting rule. Now, if (and only if) everyone in your group votes red, your group decision is red. Otherwise, your group decision is blue. That is, if anyone in your group votes blue, the group decision is blue.

Are there any questions?

Rules for Experiment Session #3

This experiment session will also last for 15 matches. The rules are the same as experiment session #2, with one exception. In this experiment, each group will conduct one preliminary vote before making the final vote. In the preliminary vote, you may vote for either the red jar or the blue jar. You do not receive any earnings for the preliminary vote. The number of blue and red votes in the preliminary vote will be revealed to you and the other members of your group. After you have been told this preliminary vote outcome, your group will conduct the final vote, in the same manner as in experiment session #2. We will conduct a practice session to illustrate how the preliminary vote is conducted.

Are there any questions?

Rules for Experiment Session #4

This experiment session will also last for 15 matches. The rules are the same as experiment session #1, with one exception. As in the previous experiment, each group will conduct one preliminary vote before making the final vote. You do not receive any earnings for the preliminary vote. The outcome of this preliminary vote will be revealed to you and the other members of your group, including the exact number of red votes and blue votes. You are not paid anything for this outcome. You must record this information on your information and record sheet. Then your group will conduct the final vote, in the same manner as experiment session #1. That is,

[read A or B]

- A Unanimity instructions: If (and only if) everyone in your group votes red, your group decision is red. Otherwise, your group decision is blue. That is, if anyone in your group votes blue, the group decision is blue.
- B Majority rule instructions: If a majority (two or more) of your group votes red, then the group decision is red. Otherwise, your group decision is blue. That is, your group's decision will be whichever color receives more votes.

Are there any questions?

APPENDIX B: SOLUTION FOR THE CASE N = 3, UNANIMITY, WITH STRAW POLL

Notation and Strategles

We use the notation of Feddersen and Pesendorfer (1998) and Coughlan (2000) in this appendix. To translate to the experiment, read guilty as "red," innocent as "blue," convict as "vote red," and acquit as "vote blue."

Denote by:

- $s = \{G, I\}$ the signal (either guilty or innocent);
- p = the probability of receiving the correct signal;
- $v_t = \{C_t, A_t\}$ the vote (either convict or acquit) in the straw poll (t = 0) and in the decisive final vote (t = 1);
- i = {0, 1, 2} the number of other convicting votes in the straw poll;
- $j = \{0, 1, 2\}$ the number of other matching signals.

Payoffs are defined as follows:

 0 for making the right decision (that is, convicting the guilty and acquitting the innocent);

- q for acquitting a guilty defendant (where $q \in [0, 1]$);
- q-1 for convicting an innocent defendant.

Each agent's strategy consists of a pair of probabilities, σ_0 , that specify the likelihood of voting to convict in the straw poll (as a function of one own's signal) and in the final vote (as a function of one's own signal, one's own vote in the straw poll, and others' vote in the straw poll):

$$\sigma_0(s) = \frac{e^{\lambda E U_{EP}(C_0, s)}}{e^{\lambda E U_{EP}(C_0, s)} + e^{\lambda E U_{EP}(A_0, s)}},$$
(3)

$$\sigma_1(s, v_0, i) = \frac{e^{\lambda EU_{PV}(C_1, s, v_0, i)}}{e^{\lambda EU_{PV}(C_1, s, v_0, i)} + e^{\lambda EU_{PV}(A_1, s, v_0, i)}}, \qquad (4)$$

where EU_{SP} (EU_{FV}) is the expected utility for casting a given vote in the straw poll (final vote).

Expected Utility for the Straw Poll

$$EU_{SP}(v_0, s) =$$

$$\begin{cases} \sum_{j=0}^{2} \sum_{i=0}^{2} \pi(j) \mu(i,j) EU_{FIN}(G, \nu_{0}, i) & \text{if } s = G \\ \sum_{j=0}^{2} \sum_{i=0}^{2} \pi(j) \mu(i, 2-j) EU_{FIN}(I, \nu_{0}, i) & \text{if } s = I \end{cases}$$

where $\pi(j)$ is the (conditional) probability of other j matching signals:

$$\pi(j) = \left\{ \begin{array}{ll} p^3 + (1-p)^3 & \text{if } j = 2\\ 2[p^2(1-p)] + p(1-p)^2] & \text{if } = 1\\ p(1-p)^2 + p^2(1-p) & \text{if } j = 0 \end{array} \right.,$$

that is, in a more compact form,

$$\pi(j) = (2 - |j-1|)[p^{j+1}(1-p)^{2-j} + p^{2-j}(1-p)^{j+1}].$$

 $\mu(i, j)$ is the (conditional) probability that i other jurors will vote to convict in the straw poll when the number of their matching signals is j:

$$\mu(i,j) =$$

$$\left\{ \begin{array}{ll} [\sigma_0(G)]^{l}[\sigma_0(I)]^{2-j} & \text{if } i=2 \\ j\sigma_0(G)+(2-j)\sigma_0(I)-2[\sigma_0(G)]^{l}[\sigma_0(I)]^{2-j} & \text{if } i=1 \\ (1-\sigma_0(G))^{l}[1-\sigma_0(I)]^{2-j} & \text{if } i=0 \end{array} \right. ,$$

and EU_{FIN} is the weighted combination of the expected utilities from voting either to convict or acquit in the final vote, where weights are given by the strategy for the final vote:

$$EU_{FIN}(s, v_0, i) = \sigma_1(s, v_0, i)EU_{FV}(C_1, s, v_0, i) + [1 - \sigma_1(s, v_0, i)]EU_{FV}(A_1, s, v_0, i).$$

Expected Utility for the Final Vote

In order to make the analysis clearer, consider first the case of a guilty signal (for now, s = G). By the end of the straw poll, all jurors can observe all the votes (so that they know j), but they still do not know what the true state is (either guilty or innocent) and what signals the other jurors received (where the number of other guilty signals can be 0, 1, or 2). This leads to $2 \cdot 3 = 6$ information sets. The conditional probability of being in any of these sets is given by:

$$\hat{\beta}(\iota, k) = \frac{\beta(\iota, k)}{\sum_{l=1}^{6} \beta(\iota, l)},$$

where

$$\beta(i, k) =$$

$$\begin{cases} (2 - |k - 2|)p^{4-k}(1 - p)^{k-1}\mu(i, 3 - k) & \text{if } k = 1, 2, 3 \\ (2 - |k - 2|)p^{k-1}(1 - p)^{4-k}\mu(i, 3 - k) & \text{if } k = 4, 5, 6 \end{cases},$$

For an intuition about these coefficients, notice that we ordered the information sets so that the defendant is guilty in the first three of them (k = 1, 2, 3), innocent otherwise. So $\beta(l, k)$ are the conditional probabilities for the signal being correct (as in this case we are taking s = G) for k = 1, 2, 3; incorrect otherwise.

For the case of s = I, we can define similar coefficients:

$$\mathcal{E}(i, k) = \frac{\varepsilon(i, k)}{\sum_{l=1}^{6} \varepsilon(i, l)},$$

where

$$\varepsilon(i, k) =$$

$$(2 - |k - 2|)p^{4-k}(1 - p)^{k-1}u(i, k - 1) \quad \text{if } k = 1$$

$$\left\{ \begin{array}{ll} (2-|k-2|)p^{4-k}(1-p)^{k-1}\mu(i,\,k-1) & \text{if } k=1,\,2,\,3 \\ (2-|k-2|)p^{k-1}(1-p)^{4-k}\mu(i,\,k-1) & \text{if } k=4,\,5,\,6 \end{array} \right. .$$

Notice that the unanimity rule in the final vote implies that, whenever a juror votes to acquit, independently of what the other jurors voted, the payoffs are determined (0 if the true state is innocent, q-1 otherwise). So:

$$EU_{FV}(A_1, s, v_0, t) = \begin{cases} (q-1) \sum_{k=1}^{3} \beta(i, k) & \text{if } s = G \\ (q-1) \sum_{k=1}^{3} \mathcal{E}(i, k+3) & \text{if } s = I \end{cases}.$$

The formulas for EU_{FV} when the final vote is to convict are more complicated. Consider the case in which the juror receives a guilty signal and votes to convict in the straw poll:

$$EU_{FV}(C_1, G, C_0, i) = (q - 1) \sum_{k=1}^{3} \beta(i, k)[1 - \theta(i, k)]$$

$$-q\sum_{k=1}^{3}\beta(i,k+3)[\theta(i,k)].$$

To understand this formula, notice that the final payoff is 0 only if the true state is guilty and everyone is voting to convict. The payoff is q-1 (as shown in the first addend) if the true state is guilty (so that the sum is over k=1,2,3) but someone votes to acquit (with probability as expressed in $1-\theta$). The second addend represents the other case, when the true state is innocent, but everyone votes to convict. The θ s are defined as follows:

$$\theta(i, k) = \begin{cases} \sigma_1(G, A_0, 1)^{3-k} \sigma_1(I, A_0, 1)^{k-1} & \text{if } i = 0 \\ \frac{1}{2} [\sigma_1(G, C_0, 1)^{1-\alpha} \sigma_1(I, C_0, 1)^{1-\alpha} & \\ \sigma_1(G, A_0, 2)^{1-w} \sigma_1(I, A_0, 2)^{w} + \\ \sigma_1(G, C_0, 1)^{1-w} \sigma_1(I, C_0, 1)^{w} & \\ \sigma_1(G, A_0, 2)^{2} \sigma_1(I, A_0, 2)^{1-2}] & \text{if } i = 1 \\ \sigma_1(G, C_0, 2)^{3-k} \sigma_1(I, C_0, 2)^{k-1} & \text{if } i = 2 \end{cases}$$

where
$$x = 1.5 - |k - 1.5|$$
 and $w = 1.5 - |k - 2.5|$.

The case for a guilty signal and a straw poll vote to acquit $(EU_{FV}(C_1, G, A_0, \iota))$ is similar, except that everyone else observes one vote to convict less than in the previous case. The formulas are as above, but for subtracting an observed

vote to convict in the θ s; for example, $\sigma_1(G, C_0, 1)$ becomes $\sigma_1(G, C_0, 0)$.

The case for an innocent signal is similar, except that it involves the ê coefficients, and the exponents in the formulas are switched. More precisely, consider the case of a straw poll vote to convict.

$$EU_{FV}(C_1, I, C_0, i) = (q - 1) \sum_{k=1}^{3} \mathcal{E}(i, k + 3)[1 - \eta(i, k)]$$
$$- q \sum_{k=1}^{3} \mathcal{E}(i, k)[\eta(i, k)],$$

where

$$\begin{split} \eta(\iota,k) = \\ \begin{cases} \sigma_1(G,A_0,1)^{k-1}\sigma_1(I,A_0,1)^{3-k} & \text{if } i = 0 \\ \frac{1}{2}[\sigma_1(G,C_0,1)^{\bullet}\sigma_1(I,C_0,1)^{1-\nu} & \\ \sigma_1(G,A_0,2)^{1-x}\sigma_1(I,A_0,2)^{\tau} + \\ \sigma_1(G,C_0,1)^{1-x}\sigma_1(I,C_0,1)^{x} & \\ \sigma_1(G,A_0,2)^{\nu}\sigma_1(I,A_0,2)^{1-\nu}] & \text{if } i = 1 \\ \sigma_1(G,C_0,2)^{k-1}\sigma_1(I,C_0,2)^{3-k} & \text{if } i = 2 \end{cases} \end{split}$$

Using the above analysis, we constructed a numerical algorithm to compute the logit QRE correspondence. The logit equilibrium correspondence has multiple solutions, due to the multiplicity of Nash equilibria in the voting game with a straw poll. There is exactly one of these that converges to the fully informative equilibrium identified by Coughlan (2000). That is, for this branch of the equilibrium correspondence, as λ becomes large, voters vote informatively in the straw poll (i.e., vote the color of their signal), and, in the final vote, they vote according to the majority outcome in the straw poll.

The key feature of the QRE correspondence is that, for all positive values of λ , voter strategies in the final vote stage are influenced by their private signal as well as the outcome of the straw poll, in contrast to the full communication equilibrium. Moreover, this conditioning follows a very logical pattern. For any combination of how the other jurors vote in the straw poll, the QRE predicts that a voter is more likely to vote to acquit if they received an innocent signal than if they had received a guilty signal. For example, consider the QRE choice probabilities at our estimated value of λ . If both other jurors voted to acquit in the straw poll, a voter with an innocent signal is predicted to vote to acquit approximately 75% of the time, while a voter with a guilty signal is predicted to vote to acquit slightly less than half the time. Similar comparisons hold for the cases in which one other voter voted to acquit in the straw poll and in which neither other voter voted to acquit. These qualitative comparisons are all borne out in the data.

We then fit the data to the logit QRE solutions using maximum likelihood analysis. Because there are multiple QRE solutions, this required searching over all branches of the QRE correspondence and over all values of lambda. Perhaps not surprisingly, the branch that best fits the data is the one that converges to the full information equilibrium identified by Coughlan (2000). The estimated value of λ is 38.34. We also fit the NNM model to the data in a similar fashion. Table B-1 shows the parameter estimates.

While the QRE picks up the qualitative features of conditional voting in the second stage, it does not provide a very good fit quantitatively. In fact, the NNM estimates provide a somewhat better fit to the data than the QRE, even though NNM does not make the right qualitative predictions.

TABLE B-1:	Model Estimates for Three-Person Groups with Unanimous Rule and Straw Vote							
•	п	f,	QRE	NNM	Nash			
$\sigma(g)$	151	.954	.882	.904	1.000			
$\sigma(I)$	149	.067	.293	.096	0.000			
σ(gC0)	31	.419	.574	.096	0.000			
σ(gC1)	47	1.000	0.995	0.904	1.000			
σ(gC2)	66	.955	1.000	0.904	1.000			
$\sigma(gA0)$	2	1.000	0.501	0.096	0.000			
$\sigma(gA1)$	2	.500	0.895	0.904	1.000			
σ(gA2)	3	0.000	1.000	0.904	1.000			
σ(IC0)	4	.250	0.093	0.096	0.000			
σ(IC1)	3	0.000	0.099	0.096	0.000			
σ(IC2)	3	0.000	0.751	0.904	1.000			
$\sigma(IA0)$	49	.061	0.259	0.096	0.000			
σ(/A1)	68	.074	0.378	0.096	0.000			
σ(IA2)	22	.682	0.978	0.904	1.000			
$\lambda \dot{\gamma}$			38.42	0.807				
$\lambda_{Io} \gamma_{Io}$			37.28	0.756				
$\lambda_{hi} \gamma_{hi}$			40.00	.850				
- <u></u>			279.63	190.62				

The reason the quantitative fit of QRE is not as tight as the NNM fit is not entirely clear. QRE predictions of choice probabilities vary substantially across information sets. For some of these sets, the QRE choice probabilities converge to 0 or 1 very quickly (especially in the second stage); for others they converge very slowly (especially in the first stage). Yet, the data in the first stage have *less* noise than the data in the second stage! Therefore, we cannot get a good fit either for the first stage or for the second stage with a single value of λ .

There is a second possible explanation. In the QRE, the frequency of voting informatively should be much higher with a guilty signal than with an innocent signal. This reflects the fact that voters who receive innocent signals are less likely to be pivotal in the second stage, so their vote in the first stage is less likely to make a difference. Consequently, the QRE choice probabilities conditional on an innocent signal converge to the informative Nash equilibrium more slowly than the QRE choice probabilities conditional on a guilty signal. The data support this qualitative prediction, but the difference is not statistically significant (.067 for innocent signals, .046 for guilty signals).

Based on this post hoc analysis, several fixes may improve the QRE fit, such as estimating a separate value for λ in the first and second stages, for different signals. Since these fixes are ad hoc, we have not pursued them.¹⁷

¹⁷ A more interesting alternative is to estimate a version of QRE that incorporates a second "tremble" term, similar to NNM, but that (unlike NNM) is accounted for in the computation of equilibrium. This would effectively bound the QRE a fixed distance from 0 and 1. We have not pursued this due to issues of computational feasibility.

Military Capabilities and Escalation: A Correction to Bueno de Mesquita, Morrow, and Zorick

M. CRISTINA MOLINARI University of Venice

Bueno de Mesquita, Morrow, and Zorick analyze the evolution of crises as a two-sided incomplete information game in order to illuminate the relationship between observable military capabilities and the escalation of a dispute to armed conflict. I show that an error in the derivation of the equilibria invalidates their conclusions, and I offer a few suggestions on how to model the evolution of crises as incomplete information games.

n "Capabilities, Perception, and Escalation," Bueno de Mesquita, Morrow, and Zorick (1997) model the evolution of disputes between nations as a game of two-sided incomplete information and test empirically their theoretical results. Their main conclusion is that the relationship between the ex ante probability of a crisis escalating to armed conflict and the countries' observable military capabilities is not monotonic; in particular, this probability is initially decreasing and then increasing. In other words, the ex ante probability of an escalation to armed conflict is at a minimum when power, measured by observable military capabilities, is balanced. Although these findings are supported by the data, the analysis of the equilibria contains a mistake that invalidates some of the statements.

This note explains the nature of the mistake and discusses how the conclusions change once the correct equilibria are considered. I find that the relationship between the observed military capabilities and the probability of armed conflict given a crisis is constant and equal to one. Therefore, observable military capabilities have no role in explaining differences in the evolution of crises, and we are left with no explanations for the empirical findings of Bueno de Mesquita, Morrow, and Zorick.

I close with a few comments about the generality of these new conclusions. In particular, I show that they are related to a result known in the economics literature as the no speculation theorem. This sheds a new light on ways to model the evolution of crises as incomplete information games.

THE UNRAVELING OF NEGOTIATIONS

Bueno de Mesquita, Morrow, and Zorick's escalation game can be summarized as follows. Two countries decide sequentially whether to challenge the status quo and resist the challenge, respectively. If a challenge is made and resisted, a simultaneous choice of either negotiation (N) or hostilities (H) takes place. When at least one country chooses hostilities a war ensues; its outcome depends on two elements: the observable

military capabilities (K) and the unobservable military abilities $(p_i \text{ and } p_j, \text{ respectively, for the two countries})$. Nation i prevails if $p_i + K \ge p_j$.

From the analysis of the equilibria of this game,

From the analysis of the equilibria of this game, Bueno de Mesquita, Morrow, and Zorick draw two main conclusions. First, the relationship between the observable military capabilities K and the probability of war given a crisis is nonmonotonic; in particular, the chance of war decreases and then increases (hypothesis 3). Second, the ex ante probability of a negotiated settlement first rises with K and then falls with K (hypothesis 4). These findings are at odds with the literature but are supported by Bueno de Mesquita, Morrow, and Zorick's data.

The claim relies on the existence of equilibrium 3 described in their article. In this equilibrium, nations whose unobservable military capabilities fall between the thresholds *pil* and *pih* or between *pil* and *pih* do not want to fight; nevertheless, they respectively make and resist demands in the hope of gaining a negotiated settlement. The proof of the existence of equilibrium 3, however, contains a mistake.

On page 26, the authors state that initiating hostilities (H) is a best reply for i if:

$$\frac{p_{i} + K - \beta}{1 - \beta} - c \ge \left(\frac{1 - \gamma}{1 - \beta}\right) \left(\frac{p_{i} + K - \gamma}{1 - \gamma} - c\right) + \left(\frac{\gamma - \beta}{1 - \beta}\right) U_{i}(N)$$

and that this is equivalent to $p_i \ge \theta$. This is incorrect since, by simplifying the inequality, p_i drops out. A few lines below, the same mistake is repeated in showing that h is j's best reply for $p_i \ge \gamma$.

Since the main conclusions of the article rely on the existence of an equilibrium in which disputes sometimes end in negotiations, it is interesting to verify whether such an equilibrium can be found. Unfortunately, this is not the case.²

Proposition 1. In no perfect Bayesian equilibrium does a dispute end in negotiations.

The formal argument is presented in the Appendix, but an informal intuition of the result is as follows. In

M. Cristina Molinari is Assistant Professor of Economics, University Ca' Foscari of Venice, Italy (cmolinar@unive.it).

I wish to thank an anonymous referee for pointing out the relevance of the no speculation theorems.

¹ See the original article for a precise description of the game and its

² As pointed out by a referee, negotiation is not an equilibrium outcome in a much larger class of games than that in Bueno de Mesquita, Morrow, and Zonck (1997). See the Appendix.

choosing whether to negotiate, country j is not interested in drawing inferences about country i's unobservable capabilities when the latter is prone to initiate hostilities. This is so because violence occurs when either country chooses it; therefore, country j is going to have a fight with the country that initiates hostilities, regardless of what it chooses.

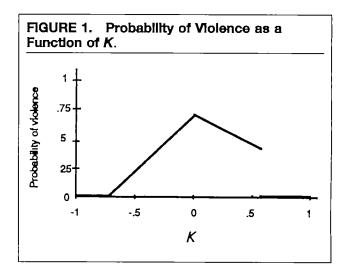

What really matters in choosing a battle over acquiescence is the unobservable military strength of a country that is prone to negotiate. If this is expected to be low, a fight is preferred, because the probability of winning it is high, and the favorable outcome of an armed conflict is preferred to negotiation. If, instead, this is expected to be high, negotiation is a better option.

Suppose that, in a crisis, j expects only countries above a threshold pih < 1 to initiate hostilities. This implies that j expects those willing to negotiate to be weaker than the average country. Therefore, even when country j is somewhat weak, it may still be willing to use force; but this implies that the threshold pjh is low and that the average strength of j (when it is willing to negotiate) is low. This inference induces an even weaker country i to use force, which further reduces the threshold pih, and so on. The equilibrium unravels, and a negotiated settlement is impossible. In other words, the willingness to negotiate is a sign of weakness that spurs more violence.

Proposition 1 implies that hypotheses 3 and 4 of Bueno de Mesquita, Morrow, and Zorick are no longer correct. Once amended, they say that the probability of an armed conflict, conditional on having a crisis, is constant and equal to one and that the ex ante probability of a negotiated settlement is constant and equal to zero. Therefore, differences in observable capabilities are of no use in explaining the evolution of crises in this model, and we are left with no explanation for the empirical evidence illustrated by Bueno de Mesquita, Morrow, and Zorick.

Note, however, that a country's observable military strength K is not trivially related to the ex ante probability of violence. For example, consider the case $U_{\iota}(SQ) = 0, \ U_{\iota}(D) = 1, \ U_{\iota}(SQ) = 1, \ U_{\iota}(D) = 0,$ and $U_{i}(N) = U_{i}(N) = 1/2$, which, for c < 1/2, satisfies all the assumptions on pages 17 and 18. This game has a very intuitive interpretation in terms of a dispute about the sharing of power. The value of power is normalized to 1; the status quo (SQ) corresponds to country i being in power; granting the concession (D)corresponds to letting country j seize power; and negotiations lead to an equal share of power for the two countries. In Figure 1 I plot the ex ante equilibrium probability of violence occurring as a function of K when c = 0.45. As shown, for extreme values of K (equilibrium 1 and 4) the probability of violence is zero, whereas for intermediate values of K the probability increases to a maximum of 0.7 (equilibrium 2) and then declines to a minimum of 0.4 (equilibrium 4).

The relationship depicted in Figure $\hat{1}$ can be explained by interpreting K as a measure of the balance in the observable military capabilities of the two countries. When this balance is tilted in favor of either state

(extreme values of K), the state that is known to be weaker backs out of the fight in order to save the cost of the conflict. When there is no known advantage for either state (intermediate values of K), the uncertainty about the military strength of one's foe makes an aggressive action potentially beneficial, and war is more likely.

These amended conclusions are consistent with the preponderance of power school³ and with the formal results of Smith (1998), which models crises and warfare as complete information games.

CONCLUSION

As we know, and as the data set used by Bueno de Mesquita, Morrow, and Zorick shows, disputes sometimes end in negotiations. Thus, we should ask what is missing in the assumptions of the game. An answer not only would provide a new starting point to explain the empirical findings of Bueno de Mesquita, Morrow, and Zorick but also would illuminate important strategic aspects of the evolution of crises.

The model of perception and capabilities proposed by the authors has much in common with a family of economic models regarding the existence of speculation due to asymmetries of information. (See Geneakoplos 1994 for a survey.) According to one version of the model, two individuals are given one card each from a shuffled deck. After seeing their own card, they simultaneously decide whether to deposit a fee in a pot or to walk away. If they both deposit the fee, the player with the highest card wins the pot, and the other gets nothing. Otherwise, they both get nothing. Choosing to deposit the fee is equivalent to a bet on the value of one's card being higher than the opponent's.

The no bet theorem for this game says that common knowledge of rationality is enough to guarantee that in no Bayesian equilibrium of this game will the bet be taken. In fact, each player knows that the bet will occur only when the other accepts it, but the opponent is more likely to bet when he has a higher card. Because

³ See Blainey 1973 and Wagner 1994 for the dispute between this school and the balance-of-power school.

each knows that his bet will be taken when he is more likely to lose it, he would rather not bet. Notice that the equilibrium outcome is the same as it would be with complete information on the values of the cards (and common prior).

Consider now the perception game. Initiating hostilities can be interpreted as a bet that one's unobservable military capability is greater than that of the opponent. The game is similar to the card game, but in the perception game only one player need take the bet; in other words, each player can force the bet on her opponent. This difference leads to a bet theorem: In every Bayesian equilibrium of the subgame, war occurs because at least one player is willing to engage in hostilities (to bet). As in the card game, the only equilibrium outcome is the one that would occur if the military capabilities of the two players were known (and the countries shared the same prior).

This shows that the perception of the opponent's strength plays no role as long as the conflict is perceived (and therefore modeled) as a bet that can be unilaterally implemented. But is this modeling choice appropriate?

For at least two reasons it might not be. The first concerns the choice of modeling the decision on how to handle a crisis as a bet. In a bet, once each player has shown his card to the other, the result is deterministic, and there is no role for unexpected events or noise to determine the outcome. This assumption is probably inappropriate for wars, whose final outcome often may depend not only on military power, both observable and intangible, of the countries involved but also on random and unexpected events.

The second reason concerns the assumption that crises can be seen as the choice about whether to bet. What is missing in this assumption is that in a dispute the utility of the "no bet" outcome, that is, what one would get by negotiating, is generally not independent of what the two countries have learned about their respective intangible capabilities during the crises. In other words, negotiating offers should be modeled as endogenous (as, for example, in Fearon 1995 and Powell 1996).

APPENDIX

The proof is given for a more general game than that of Bueno de Mesquita, Morrow, and Zorick. In this game, the unobservable military capabilities p, and p, are real numbers with any strictly positive probability distribution.

*Proof.*⁵ Suppose there is a perfect Bayesian equilibrium in which negotiations occur with strictly positive probability, and consider the subgame starting after a demand is made and resisted. Let $F(\cdot)$ and $G(\cdot)$ be the cumulative distribution function representing, respectively, the updated distribution of p_i and p_j in the subgame. Using an incentive compatibility argument, we know there are threshold values pih and pjh such that all types $p_i < pih$ and $p_j < pjh$ who reached the subgame choose to negotiate. Suppose F(pih) and G(pjh) are strictly positive.

Consider type p_i . Its expected utility for hostilities is

$$Pr(p_{i} \leq p_{i} + K) - c = G(p_{i} + K) - c,$$

and its expected utility for negotiating is

$$\begin{split} &G(phy)U_{i}(N) + (1-G(phy))[Pr(p_{j} < p_{i} + K | p_{j} > phy) - c] \\ &= G(phy)U_{i}(N) + (1-G(phy))\bigg[\frac{G(p_{i} + K) - G(phy)}{1-G(phy)} - c\bigg]. \end{split}$$

Thus, type p_i prefers to fight if

$$G(p_i + K) - c > G(phj)U_i(N) + G(p_i + K) - G(phj)$$
$$- (1 - G(phj))c,$$

which simplifies to

$$1-c>U_{\iota}(N).$$

This inequality is true by assumption; therefore, all types p_i prefer to fight, and $F(p_i) = 0$.

⁴ Notice that, in contrast to the no speculation theorems, violence occurs even if negotiations are ex ante Pareto optimal, that is, when $1/2 - c < U_i(N)$, i = 1,2. This is so because in the no speculation theorems the ex ante Pareto optimality of the initial allocation is required to rule out trade for reasons different from pure speculation; therefore, it plays no role in the speculation result I get.

⁵ I thank a referee for suggesting this line of proof, which is cleaner than the one originally proposed.

Reply to "Military Capabilities and Escalation: A Correction to Bueno de Mesquita, Morrow, and Zorick"

BRUCE BUENO DE MESQUITA Hoover Institution JAMES D. MORROW Hoover Institution ETHAN R. ZORICK University of Essex

e thank Professor Molinari for bringing the error in our article (Bueno de Mesquita, Morrow, and Zorick 1997) to the attention of the readers of the *Review*. Despite the inadequacies of the model we presented, we continue our efforts to explain our empirical results. This brief reply sketches lines of argument that we are pursuing in our research.

A state in a crisis judges whether it is willing to accept a negotiated settlement by comparing the settlement to its prospects in a war. Conventionally, the latter is modeled as a known and fixed expected value for a state based on the importance of the stakes, its willingness to suffer costs, and its relative military capabilities (e.g., Fearon 1994; Powell 1996). That expected value is often treated as private information, where the sides do not know one another's value for war but do know their own. War, however, is a contest in which those values for both sides affect the outcome. Consequently, we cannot assume that either side in a crisis knows its expected value for war because the outcome of the war depends on the private information of both sides (Wagner 1998).

In the game analyzed in our article, we attempted to address this issue by treating the decision whether to use violence as simultaneous and by examining the deterministic relationship between private information and war outcomes. We address changes in both these features.

War results when both sides choose to use violence to resolve their dispute. As our data analysis shows (see Bueno de Mesquita, Morrow, and Zorick 1997, Figure 4), unilateral uses of violence occur frequently in crises. One side chooses to use force; the other side must then decide whether to use violent means to resist that force. Our model did not differentiate reciprocated violence from unilateral violence, although our data analysis did. An alternative sequence gives each side a chance to escalate to violence with a subsequent decision by the target to respond with violence. If the target does not respond with force, then the initiator of violence wins the stakes. This sequence differs from some notable models of crises where one party alone can initiate war (e.g., Fearon 1994). It also changes the

Bruce Bueno de Mesquita is Senior Fellow and James D. Morrow is Senior Research Fellow, Hoover Institution, Stanford University, Stanford, CA 94305. In fall 2000 James D. Morrow will be Professor of Political Science, University of Michigan, Ann Arbor, MI 48109. Ethan Zorick is Lecturer in International Relations, Department of Government, University of Essex, Wivenhoe Park, Colchester, CO4 3SQ, UK.

decision involved in escalating to violence because the sequence creates the possibility of gaining the stakes without suffering the costs of war (Bueno de Mesquita and Lalman 1992).

We modeled the outcome of war as deterministic in the sides' private information. Molinari comments that random elements are likely to play a role in war, and we agree. Yet, random factors whose probabilities are common knowledge simply become part of players' expected values for war. Furthermore, such expected values are likely to be less extreme than deterministic outcomes based on private information, making the weaker side more willing to use violence in a crisis. Adding random events then would not address the question of why all actors wish to use violence in any equilibrium of the model. Instead, we suspect that the expectation from war must be more extreme than surrendering the stakes of the crisis by refusing to resist violence. This would result when the victor in a war expands its demands beyond the original stakes of a crisis.

We are exploring these variations and others in our attempt to explain our empirical results with a formal model. Any such revised model must not only explain the patterns we have found so far in the data but also must predict some pattern that we have not yet observed, thus predicting novel events as well as known regularities.

Finally, Molinari also suggests that a model of crisis bargaining should allow the negotiated alternative to war to be endogenous. We agree and look forward to Professor Molinari's efforts in this direction.

ncreasingly, demands for liberty and equality have been transmuted into, or combined with, calls for recognition of previously excluded or marginalized groups. This shift is due in part to the fact that simple group separation or autonomy is rarely feasible in postmodern societies. Instead, subordinated groups must find a path that combines integration as equals with retention of and pride in their distinctive lives. Contemporary discussions of recognition have ranged from the most general to those with a specific focus on racial, ethnic, and national minorities or gender or a combination of the above (see, e.g., Benhabib 1995; Honneth 1996; Taylor 1992). Virtually none of these works has approached the question of sexual minorities in heterosexual regimes. The more politically sensitive among them list gays and lesbians in a line of subjugated or excluded peoples, but none has questioned the distinct contours of gay and lesbian oppression and

Although some of the feminist work in political theory mentions lesbians and gays and draws connections between sexism and heterosexism, by and large feminist theory has failed to adequately understand the position of sexual minorities. Feminist analyses understandably center on gender and generally treat sexual oppression (if at all) as a simple consequence of gender oppression. Same-sex couples serve Susan Okin (1989, 140), for example, to demonstrate the link between gender hierarchy and family roles, but they receive no discussion on their own terms; clearly for Okin, as for most feminist theorists, they are the "foreigners" who demonstrate what might be rather than subjects in their own right. Okin is not concerned to investigate the particulars of same-sex couples or to understand how

gender operates within these couples to produce patterns of privilege quite different from those between heterosexual men and women (although, in her defense, most of the empirical work on these patterns was done after her book was published). Instead, her glancing mention of same-sex couples serves as a rebuke to heterosexual inequality. Iris Marion Young's (1990) more nuanced treatment seems to account for the specificities of lesbian and gay existence as distinct from gender and, indeed, highlights homophobia as "the paradigm of ... border anxiety" (p. 146), more abiding and visceral than racism and sexism. Still, Young's aim of a general theoretical argument makes lesbians and gays just one example in an account that largely takes sexism, racism, heterosexism, ageism, and ableism as distinct but equivalent problems.

These projects have been important contributions to political theory. Still, there is a need for theories that begin from the issues and perspectives generated by differences in sexuality. We need to see how the world looks if we begin from the position of lesbians and gays rather than from that of heterosexuals. This includes revisiting theories that have proved both useful and problematic. The putatively neutral subject of liberalism has, as many critics have shown, turned out to be a member of dominant groups whose notions of reason work to silence others rather than include them. How might theories change if that subject is, and knows itself to be, a sexual minority? The authors under review here offer different and illuminating answers.

This essay evaluates the ways in which thinking about lesbian and gay lives can illuminate and improve liberalism and diagnoses the strange persistence of this flawed cluster of theories. The liberal/communitarian debates of the 1980s, and feminist political theory in that same period, demonstrated that liberalism does not require an abstract self and that rights can be construed in a relational framework and within a genealogy that includes the rise of disciplinary apparatuses. These debates have made their way into contemporary lesbian and gay political theory (Phelan 1989, 1997) but not simply in a derivative manner. Instead, recent work demonstrates that using the lens of (homo)sexuality illuminates hidden or muted elements in liberalism. A group that is targeted for discipline, whose rights have been continually unsure, and whose relationships (erotic and otherwise) have had to be fought for must necessarily rethink what sort of self, and what sort of rights, is worth fighting for. Although

¹ Angelia R. Wilson (1994, 36) notes that "gay and lesbian political theory" amounts to a different project from earlier inquiries into homosexuality precisely because "one is about fitting the example of homosexuality, as a moral act, into a known philosophical or moral scheme and the other is about exploring how different philosophical frameworks can facilitate a gay and lesbian political movement which takes as a premise that sexuality is part of individual identity."

the books under review here present many arguments and themes, together they produce a series of reflections on whether liberalism is an adequate or useful political theory for lesbians and gays and on what sort of liberalism might quality for that status.

The most obvious and simple-minded liberalism among advocates for lesbian and gay rights is found in *Virtually Normal*. Andrew Sullivan contends that a sound "politics of homosexuality" consists in the "principle" that "all *public* (as opposed to private) discrimination against homosexuals be ended and that every right and responsibility that heterosexuals enjoy as public citizens be extended to those who grow up and find themselves emotionally different" (p. 171). This means

an end to sodomy laws that apply only to homosexuals; a recourse to the courts if there is not equal protection of heterosexuals and homosexuals in law enforcement; an equal legal age of consent to sexual activity for heterosexuals and homosexuals, where such regulations apply; inclusion of the facts about homosexuality in the curriculum of every government-funded school, in terms no more and no less clear than those applied to heterosexuality (although almost certainly with far less emphasis, because of homosexuality's relative rareness when compared with heterosexuality's recourse to the courts if any governmental body or agency can be proven to be engaged in discrimination against homosexual employees; equal opportunity and inclusion in the military; and legal homosexual marriage and divorce (pp. 171–2).

Sullivan maintains a liberalism that focuses only on the relation between the state and individuals and rejects any state responsibility for the social status or welfare of citizens. His is the most rigorous (one might say rigid) sort of "negative liberty." Ending sodomy laws is for him a classic case of the expansion of freedom from the state rather than freedom via the state. Allowing same-sex marriage and the equal participation of homosexuals in the military is not, for Sullivan, a matter of state support (although I doubt that Orrin Hatch will agree) but of removing state barriers to participation. The latter involves changing the military culture, no small task indeed, but legally it is less a matter of direct intervention than of ceasing active discrimination. Marriage simply involves removing statutes (currently multiplying like rabbits) that ban such marriages. Sullivan rejects other projects, such as employment nondiscrimination, on the grounds that they interfere with private choices, choices based on personal morality that he argues cannot be mandated from above.

Sullivan rests his argument on the distinction between and separation of civil society and the state. He argues that true social change is the province of civil society. In this most writers of whatever stripe would agree. What is occluded, however, is the question of the state's role in civil society. Sullivan treats individuals either as presocially constituted (in the case of sexual desire) or as shaped in realms of family and civil society that are presumed to be separate from, even opposed to, the state. Civil society, in its turn, appears as simply "there," akin to the abstract individual in its lack of intrinsic relation to government apparatus. The

role of the state in fostering public realms, and the reciprocal constitution of the state in civil society, is obfuscated by the liberal separation. This obfuscation prevents us from asking how the state is constituted as a heterosexual body and how heterosexual imperatives constitute citizens. These are precisely the questions that must be asked if we are to challenge heteronormativity. A new liberalism that will speak to the situation of gays and lesbians (as well as others) cannot begin simply from normative theoretical principles; rather, it must unite these with attention to the construction of states and communities in order to find the particular articulations of those principles that will work for those states and communities—not simply reinforce their existing ways of life but enable them to adapt and change.

The problems of orthodox liberalism led gays and lesbians, along with other new social movements, to explore other theoretical resources. Gay liberation theory grew out of Marxism, in particular Marcuse's treatment of sexuality in Eros and Civilization (1955), and focused on the relation between sexuality and capitalism. Dennis Altman ([1971] 1993), Mario Mieli (1977), and Guy Hocquenghem (1978) each offered analyses suggesting that without the guilt and renunciation demanded by capitalist discipline we would all be polymorphously perverse, free to experience pleasure with a variety of different partners. This "liberationist" theorizing is now virtually unknown and/or discredited even by students who see themselves as radical (Lehring 1997). In academic circles Marxism was pushed aside not by liberalism, however, but by poststructuralism. This shift marked the decline of utopian or universalist theories that aimed at the end of repression in favor of theories that sought to account for the particular constructions of self and society that include not only repression but also forces of desire, meaning. and agency—that is, theories that understand the heterosexual self not simply as one forced to abandon its homosexual desires upon pain of expulsion but as a self created and given meaning precisely by the lure of belonging to the "normal."

In the formation of lesbian and gay theory, the version of poststructuralism with the most influence was that of Michel Foucault. Foucault's documentation of the move from punishment to discipline, and the supplementation of sovereignty with normalizing power, was centered around the creation and use of "sexuality" as a mechanism for discipline. Sexuality, Foucault pointed out, was the perfect node for this new constellation of power. Through it, policymakers could combine the macro goal of population management, what he calls "a bio-politics of the population," with the need for control and regulation of individual bodies for capitalist production and consumption—"an anatomo-politics of the human body" (Foucault 1978, 139).

Central to this new regime of biopower was the idea of sexuality as something to be discovered, regulated, and managed. This is evident in everything from the new field of sexology, to eugenics campaigns, to school programs for sex education and hygiene. Sexuality

became something that defined the self, one's innermost truth. Those whose sexuality was found to be different became populations to be studied and cured. Thus, in Foucault's (1978, 43) famous phrase, "the sodomite had been a temporary aberration: the homosexual was now a species." (p. 43). Repression is not abandoned as a problem, but it is elaborated within a larger network of productive power that creates subjects for whom repression appears as an issue: The struggle against repression, central to liberationist theory, is presented by Foucault as "a tactical shift and reversal in the great deployment of sexuality" (p. 131). (Sullivan, who conflates Marcusean liberationism with contemporary "queer theory," completely misses the importance of this point.) Foucault championed the need to make sexuality a project, part of one's subject formation, not in a disciplinary sense but as an ascetic exercise. The disciplinary apparatus, he argued, should be challenged not by simple opposition in the name of some preexisting desire or nature but by the creation of new relationships and forms of meaning. His insistence on the historical nature of sexual identities, which is shared with Jeffrey Weeks (1981, 1985) and later many others, provided an alternative to understandings of sexuality as simply "natural" (or not), immutable on a personal level, with its own transhistorical categories. In the light of Foucault's work, we are cautioned against claims that lesbians and gays form a natural unit or share any sort of continuous history. Gay and lesbian theory, and sexuality studies in general, has been a primary site for thinking about social construction precisely because sexuality is one of the clearest examples of the relation between the construction of subjects, economics, and public policies (Stein 1990). It is also a preeminent site for challenging neat lines between civil society and the state.

Through a constructionist lens, sexual types are "real" but not timeless categories. As Foucault and others have agreed, the biology of sex may or may not show links between bodily differences and differences in "sexual orientation." Constructionists do not (or do not all) deny the "reality" of biology, but they suggest that biology is not the principal site for the organization of sexuality. As Weeks puts it in Invented Moralities (p. 7), "the real problem does not lie in whether homosexuality is inborn or learnt. It lies instead in the question: what are the meanings that this particular culture gives to homosexual behavior, however it may be caused, and what are the effects of those meanings on the ways in which individuals organize their sexual lives." A social constructionist perspective simply makes clear that sexual categories are a human creation, varying across cultures and times, and that the variety of categories gives rise to substantively different lived experiences.

It does not follow from constructionism that a given category or boundary is right or wrong. Rather, social constructionism forces us to abandon arguments founded on God or nature in favor of substantive moral arguments about the sort of people we want to be. As Stanley Fish (1999) has recently noted, nothing follows from social constructionism in terms of partic-

ular moral stances; rather, what changes is the ground of legitimation for one's arguments. As an hypothesis about history, social constructionism mandates attention to the historical formation of categories that we take to be timeless. It is precisely this thesis of historical formation that alarms both those who would bar sexual change and those who would claim rights in the name of their inviolate identities. Sexuality is such a complex and fruitful arena for political theory because it is a major terrain for battles over the relation between identity and behavior, the social construction of political identities (and the political construction of social identifies), the role of the regulation of sexuality in modern governance, and the nature and extent of freedom, power, and justice.

Activists for lesbian and gay equality have by and large sought to bypass these issues by focusing on sexuality as a nexus for identity, a point with which our authors would have few objections. Activists part company with many academics, however, by presenting sexuality as immutable, a matter of ascription rather than choice, so as to bypass moral debates (Currah 1995). This strategy has been at least a partial success, as heterosexual Americans have become more tolerant of those "others" who "cannot help it." It is for this reason that activists have been largely suspicious of constructionist theory. Fearing that construction is too much like arguments centered on behavior or choice (a misconstrual not uncommon even among academic readers of constructionist theory), they charge theorists with hurting "the cause." The reality of the matter is more complex. Constructionism does not eliminate claims to equality, membership, and rights but changes the ground for these claims from the atomistic individual. "born" with a nonnegotiable sexuality (of whatever orientation) that must be respected, to a subject formed through processes of meaning and power that must be critically examined. Our authors disagree on the question of whether, or to what extent, a constructionist ontology necessarily challenges liberalism. They also, as we will see, differ in their careful attention to the implications of constructionism for their consideration of group formation, maintenance, and position.

The relative invisibility and mutability of sexual minorities produce an experience unlike that of most other groups other than (most) religious minorities. As opponents of inclusion are fond of pointing out, we are only attacked or fired or arrested if we make our homosexuality apparent. Of course, current conceptions of gender and sexuality mean that some will always be virtually unable to pass; very butch women or femme men are assumed to be queer and are treated as such. The argument for mutability tends to be a weapon of opponents as well, suggesting that we have a choice and therefore should bear the onus if we choose "sin" or "deviance." (This, in fact, was my mother's response when I reported to her a series of rapes of lesbians while I was in graduate school.) In response, activists have largely insisted that sexuality is immutable, a matter of genes or early conditioning rather than conscious choice.

As Vera Whisman (1997) has shown, however, the

debate about immutability is far from settled; many lesbians, and fewer gay men, understand themselves as "queer by choice." In both visibility and mutability, lesbians and gays are closer to religious group members than to racial or ethnic minorities. Like those whose religion is important to them, their specificity is sometimes easily apparent (e.g., dress codes for Orthodox Jews or Sikhs) and more often not. Like them, too, religion is something that is mutable but also quite stable over time; we acknowledge that someone born "one way" may turn to another in life, but we do not consider the later religion to be less authentic or important for that person's identity as a consequence of being chosen. The irony of this kinship has been noted by several authors (Mohr 1988; Phelan 1994; Richards 1999), but it has yet to make its way into the mainstream of public discussion or legal interpretation.

If the questions of visibility and mutability shape a distinctive experience, perhaps greater is the fact of growing up in communities that do not mirror our distinctive difference. This presents a problem both for individuals and for communities, but it also represents a unique opportunity for what Mark Blasius calls "ethical self-constitution." On his way to characterizing this self-constitution, Blasius offers in Gay and Lesbian Politics the most faithfully "Foucauldian" analysis of the authors under consideration here (indeed, readers of Foucault will find little that is new in the early chapters). Successive chapters on the possibility of gay and lesbian politics, the politics of sexuality, subjectivity and identity, rights, and "an ethos of lesbian and gay existence" follow Foucault's later work on power and subjectivity while developing a specific argument for gays and lesbians.

For Blasius, "being lesbian or gay today is by definition political" (p. 1) insofar as one comes out, that is, figures oneself as lesbian or gay through one's relationships with others. Of course, not all those who have sex with others of the same sex, or all of those who want to, are lesbian and gay; many who do so refuse to acknowledge either the desire, the activity, or the identity. Blasius asserts that those who do not come out "exist in the prepolitical condition of domination" (p. 2) (a situation in which "the actions of one...elicit and guide or command the actions of another with a high degree of certainty" (p. 21). Those who do come out become lesbian or gay, persons formed through "subjection," a process of discipline that forms identities and guides actions without the lack of reciprocity characteristic of domination.

This is still, however, short of agency; Blasius states that agency for lesbians and gays follows from "erotics," the creation of new forms and forums of sexuality to challenge subjectification. His notion of an "ethos" describes a "way of life" that "emerges not so much from moral as from existential criteria" (p. 209), specifically the content of lived experience. In this ethos, lesbians and gays "invent themselves, recognize each other, and establish a relationship to the culture in which they live" (p. 183). He contrasts an ethos with a lifestyle or a community (while acknowledging elements of both in lesbian and gay life): lifestyle is too

narrowly consumerist a notion, while community presumes too much unity and preexisting definition. An ethos, in his terms, allows for self-creation in all seriousness, allowing for both ethical and aesthetic elements without collapsing into either abstract normativism or moral relativism.

Although Blasius devotes considerable time to the distinction between the agency of erotics and the faults of moral relativism, in the end it is less clear what sorts of limits he might accept than what he rejects. He rejects any "codes of behavior" such as Kirk and Madsen's (1989) infamous "Self-Policing Social Code," which urges restraint in front of heterosexuals and incorporation of middle-class white standards of comportment (including rules such as honesty and a ban on negative gossip), but he gives no real clues as to what values might guide us. Blasius cites Sarah Lucia Hoagland's Lesbian Ethics (1988) for support on ideas about community and ethos, but he does not engage her more serious treatments of ethical questions. In the end, it seems, the only thing that clearly does not go for Blasius is moral codes.

Central to the creation of self and ethos, states Blasius, is the elaboration and defense of "lesbian and gay rights," aimed at "self-determination of one's relationships with others" (p. 137). This idea, as we shall see, runs throughout lesbian and gay political theory. This should not be surprising; a group stigmatized on the basis of its relationships might be expected to defend them. What may be more surprising is the richness opened by this thread. The development of relational arguments for rights may be the most significant advance offered by our authors, dovetailing with recent feminist legal and political theory on privacy and "the personal sphere" (e.g., Boling 1996) as well as anthropological accounts of alternative family forms (e.g., Lewin 1993, 1998; Weston 1991).

Blasius's formulation of the "relational right" construes it as the right of "self-determination and actualization" through relationships with others (p. 140). This right encompasses what he describes as the central "moments" in lesbian and gay rights struggles, rights for sexual freedom, equality, and "equity in the cultural and social acknowledgment of one's health needs and the consequent receipt of the benefits of citizenship" (p. 152). Blasius's primary target in this formulation is the primacy of privacy strategies in arguments for rights, a primacy that had already sharply receded after the Supreme Court upheld antisodomy statutes in Bowers v. Hardwick (1986). For Blasius, "privacy" seems to be the name for liberal strategies that do not account for the "normalizing-disciplinary ordering of power" (p. 133) which makes "juridico-discursive" models inadequate. The central insight that Blasius draws from Foucault is the need for rights to account for and improve the ways in which we live our daily lives, in relationship with others, rather than as abstract individuals carrying our rights bundles with us as we jostle with others to reach our goals. Because gays and lesbians are not vilified for some internal essence (although that has been introduced into arguments) but for the ways we interact with others, rights that

presume and defend our relationships with others are essential to equal citizenship. (Of course, this is the case for all people, as Weeks will make clear; a queer angle may give a certain salience to this issue, but it is not an issue for queers alone. Indeed, such an insight is at the heart of all communitarian thought and most feminism as well as poststructuralism.)

Blasius's claim to an equity right is elaborated through the example of AIDS politics, but it extends beyond that to a general claim for "a right of access to protection from any biological risks derived from sexual relations" (p. 151). Blasius derives this right from the larger right to sexual self-determination, arguing that in an era of biopower and population management the government has an affirmative responsibility to ensure the health of its citizens. This point clearly reflects his anger over the U.S. government's (non) handling of AIDS for the first several years when it was taking hold here and its continuing stigmatization of nonheterosexual people with AIDS. There is still enough in his argument, however, to give the reader pause. Do governments, even ones heavily invested in biopower and strategies of governmentality, have a responsibility to protect citizens from all health consequences of their behavior? If this holds only for sexual behavior but not for other forms of self-creation and expression (and it is not clear that Blasius would so limit it), what would justify such privileging? Blasius notes that sexual relationships are a central means through which we (gays and lesbians, at least) define ourselves. Do governments then have an obligation to support all the central ways in which we define ourselves? This argument lurks in the text, but it is not sufficiently spelled out to be defended against those who might object. What of those whose means of definition is a religion that disapproves of homosexuality? Should they be allowed to discriminate against people whose sexual tastes they abhor? If not, why exactly should sexuality be privileged over other forms of identity formation and maintenance?

The reason is likely to be more personal than philosophical. Many lesbians and gays of color have criticized white male politics for treating sexuality as a variable that can be understood in isolation from race, gender, and class. For otherwise privileged men, their homosexuality stands out as the barrier to equality and integration. Other differences, while acknowledged, are less likely to be integrated into analysis or action. Given Blasius's stated concern for "lived experience," it is striking how little the author acknowledges the differences between the experiences of lesbians and those of gays, or those of varying racial or class backgrounds. Throughout the 1970s and 1980s (and to a large extent in earlier and later periods), lesbians remained separate from gay organizations and communities. Although heterosexuals and gay men often interpret lesbianism solely through the lens of "homosexuality," lesbian theory and politics throughout the twentieth century have sought to incorporate the lens of homosexuality with the experience of female assign-

Blasius denies this distinctive perspective, and in so

doing he crucially misreads the few lesbian sources he cites. Lesbians appear in Blasius's work with their feminist commitments and analyses elided. In her classic essay, "Compulsory Heterosexuality and Lesbian Existence," Adrienne Rich (1980) analyzed "compulsory heterosexuality" for women as a primary instrument of women's subordination and argued for a desexualized lesbianism ranging from Chinese marriage resisters, to nuns, to "Boston marriages," to contemporary lesbians under the sign of female-identification and resistance to patriarchy, but it emerges here (as in much recent gay writing) as a critique of enforced heterosexuality for both men and women. Likewise, Hoagland's Lesbian Ethics, on which Blasius relies for descriptions of culture and community, loses the lesbian separatism at its heart in favor of claims for "a common lesbian and gay male culture" (p. 201). Of course, authors are not required to read and use texts only as their authors understood them; but given Blasius's concern for concrete historical experience, his abstraction and flattening of historical and contemporary differences sharply limits his claims. As Lehr points out in Queer Family Values (citing L. Brown 1995) lesbians and gays not only experience different social positions and challenges but also do not even agree on conceptions of sexual identity and its stability. An "ethos of lesbian and gay existence" that does not include acknowledgement of these differences will be of limited use.

For all his language of community, culture, and ethos, Blasius seems to see these as detached from issues of state or polity. Quite strikingly, his argument for equity bypasses traditional social-democratic or welfare-state principles that would mandate accessible and knowledgeable health care for all citizens, no matter what the genesis of their malady, on grounds of the common welfare or minimal standards of civility and decency. Instead, he proceeds down a route much more in keeping with individualism. Not our common concerns, but our need and right to form intimate relationships, justify equity rights. The relationships that he deems ontologically basic to humans do not extend beyond the intimate sphere, or the zone of communities based on a shared ethos, to include the much more distant and yet inescapable relations of modern bureaucracy and urbanization. The government, even after biopower, appears in strikingly liberal guise as the guarantor of basic services rather than a creative power, although Blasius agrees with Foucault's diagnosis of the risk of governmentality, his concern for private creation in resistance to medical authority leads him to conceive of government in strikingly liberal

Blasius's focus on an ethos reflects another peculiarity of lesbian and gay existence. Unlike most other marginalized groups, as Lehr notes in her work (p. 139), lesbians and gays grow up in communities that actively stigmatize them even before they know that they "belong" to the group. As a result, both the families and the communities shaped among lesbians and gays tend to consist only of adults. One of the strongest contributions in *Queer Family Values* is the

discussion of the question: "Who are our children?" Lehr argues that the current focus on creating families, either through adoption or with the children of earlier marriages, must be combined with the creation of service agencies and programs that provide models of homosexual maturity. This is part of a larger project of a "politics of family" that is organized around care rather than rights (although, as I will note later, rights are not so easily disposed of). Successive chapters move between treatments of feminist and radical democratic theory and analysis of current trends in "family politics" that are too often treated in isolation from lesbian and gay issues.

The chapter on social problems and family ideology is a must read not only for those in lesbian and gay studies but also for anyone concerned about the implications of the "ideology of the heterosexual nuclear family as the means of raising good citizens" (p. 107). Lehr powerfully engages conservative theorists such as David Blankenhorn, who argues for the necessity of heterosexual, two-parent families, and she demonstrates the ways in which conservative gays and lesbians share their premises and fears about social change. Lehr argues that the current drive for marriage and "normal" families must be seen within the context of larger American family politics, including the increasing conservatism manifest not only among the religious Right but also among communitarian and neoliberal thinkers. She suggests that prioritizing marriage colludes in a larger sexual conservatism, manifest among lesbians and gays as well as heterosexuals. This conservative politics takes sexual orientation as fixed but detaches it from gender so as to suggest that gender nonconformity is a sign of immaturity (see also Gamson 1998).

Lehr's discussion of the political stakes in sexual immutability is invaluable. She draws examples from youth support group manuals, from legal arguments, and from legal and political theorists such as Thomas Eskridge and Andrew Sullivan. For Eskridge and Sullivan, gender nonconformity is a product of oppression that will vanish as equality nears. Yet, since Eskridge (1996) believes that male sexuality is inherently unruly, requiring social constraints, gender conformity does not equal "maturity" for men; maturity must be acquired through marriage and the renunciation of other partners, as "sexual liberty" gives way to "civilized commitment." The widespread popularity of these ideas testifies to the fact that sexual oppression does not guarantee a critical perspective on gender. It is not accidental that Lehr is more centrally involved with feminist theory than queer theory or lesbian and gay studies; as Martin (1996) has noted, recent queer theory has largely abandoned or ignored gender, and many authors have faulted it for its blindness about class and economic issues (Evans 1993; Hennessy

Lehr challenges virtually every comfortable element in contemporary lesbian and gay politics. Along with immutability and the desirability of marriage, she challenges readers to come to terms with polygamy, racial differences in understandings of sexuality, and violence

within marriage. Her critique of identity politics in a book focused on gays and lesbians points to the paradox of constructionist theorizing about lesbians and gays. Lehr recognizes that such groups exist, but she does not accept that they are natural or fixed, nor does she believe that a politics centered simply around sexual identity is sufficient for social change. "To reinforce an understanding of identity as unified around a single aspect of our experience through identity politics is to accept an understanding of the self and definitions of naturalized social reality that make systemic change difficult, if not impossible" (p. 81). Change is made difficult, she argues, because a politics in which some groups simply "assert their separate identity" leaves others (such as "those who are straight, male, or white") unable to respond (p. 83). One wishes that Blasius had had this book available to him when he wrote.

In general I agree with Lehr's critique of identity politics, but it is important to distinguish two issues that are often conflated. First is the question of the naturalization of identities, exempting them from negotiation and change. Related, but not the same, is the political question of whether one's struggle and issues articulate with those of others. Although we often see these two together (as in the insistence of many gay men, recently highlighted at the annual convention of Log Cabin Republicans, that abortion and other "women's issues" are not "gay issues"), they are not inevitably linked. One may understand one's homosexuality as fixed and innate and still understand one's oppression as generated by the same forces that produce other oppressions; one may also be an ontological constructionist and see one's situation in isolation from all others. Constructedness does not guarantee alliance, although many of us would like it to; nor does a belief in immutability necessarily equal consumerist lifestyle politics (Evans 1993).

Lehr opens Queer Family Values with a sharp critique of "rights talk," suggesting that "the extension of rights depoliticizes issues that need to be subject to public debate and discussion" (p. 14). Drawing centrally upon Wendy Brown's (1995) recent work, Lehr states that conceptualizing freedom in terms of rights "keeps us from asking what 'freedom' means" (p. 15) and prevents us from understanding the importance of our collective decision making and mutual self-creation. Questions about "the right to marriage," for example, do not seriously question the institution of marriage itself but, rather, presume both its value and its structure—presumptions that Lehr sees as problematic for gay and lesbian equality. She follows Joan Tronto's (1993) work on care ethics and argues for a more public culture of care to replace the relegation of care and caring activity to the family. These are all important points. Liberal individualism has consistently privatized the most important issues of human life, including those that are in fact decided or structured in "public" arenas. Lehr, however, relies on a narrow interpretation of liberalism to make this point. For her, liberalism is represented by Locke (and, secondarily and by implication, Rawls). She is entirely on target

with her criticism of Lockean liberalism, but that is not the only liberal tradition, indeed, not even the only American liberal tradition. John Stuart Mill's attempt to combine individual liberty of action and expression with economic coordination and John Dewey's liberalism of care and community are absent from the book. Thus, Lehr does not dispose of liberalism as thoroughly as she would like. Her preferred option, radical democracy, in fact has emerged from a synthesis of Gramsci, poststructuralism, and liberalism. Lehr's analysis perhaps would have been sharper had she articulated her target not as "liberalism" per se but as individualism and the remnants of patriarchy. These are her actual targets, and the book is strongest when she trains her sights on them through the reading of contemporary profamily literature of all persuasions. The question of liberalism's usefulness to lesbians and gays is not disposed of by either Blasius or Lehr, it awaits a more direct confrontation.

Lesbian and gay political theory not only includes theory directly focused on the situation(s) of gay and lesbian people but also affords new perspectives on sexual values and the role of sexuality in politics. Just as feminist theorists have not contented themselves with writing about "women" but have used the analytical lens of gender to examine (re)production, the "social contract," citizenship, freedom, obligation, and other "traditional" issues of political theory, so lesbian and gay theorists are focusing on sexuality, and sometimes through sexuality, to gain new insights.

Jeffrey Weeks (1981, 1985) and Steven Seidman (1996), both sociologists of a historical bent, recently have offered considerations of what Weeks calls "sexual values in an age of uncertainty." Drawing on Anthony Giddens, Zygmunt Bauman, Agnes Heller, Michael Walzer, and Charles Taylor, Weeks fashions an argument in Invented Moralities for a "radical humanism" that centers on the values of care, responsibility, respect, and knowledge. His previous work on the history of sexuality and lesbian and gay history has been a major resource for social constructionist arguments. Weeks bases his position on a "historical approach to the erotic" (p. 5), which assumes that sexuality is not simply "there" as a bodily impulse but is subject to social forces. The consequence of this is not the end of values, as conservative opponents allege, but the need for a conscious reexamination and reconstruction of sexual values. Successive chapters outline "the postmodern condition" of uncertainty and its implications for the active shaping of moralities before moving directly to the question of sexual identities; the relationships among privacy, intimacy, and everyday life; and the implications for rights struggles. Throughout, Weeks moves between the general theme of sexual values and the specific situations of lesbians and gays, but his clear intent is not to write a book "about gays and lesbians" but to address all moderns about sexuality.

As his sources might suggest, Weeks begins and ends with a sort of postmodern communitarian position. His premise, a problematic one for the United States, is that "we" live uniformly in a "post-Christian" age,

having "escaped the ethical codes of the Christian era" in favor of a no less oppressive scientific-disciplinary ethical system. This, of course, is a theme shared by Giddens, Foucault, Bauman, and others, but those in the United States may pause. It is surely the case that the ground for values, and the need for ground, has shifted; but a book that begins with the premise that Christianity is no longer a dominant force in public and private life assumes too much for American readers. This premise, however, serves Weeks in his concern about "sexual libertarianism" (p. 29) and "radical individualism." These follow from the belief that "if God is dead, everything is permitted"; they are the continuing companions of traditional onto-theological systems, not the product of (post)modern thought itself. In offering a postmodern sexual ethics, Weeks aims to "reground" ethics in actually existing communities as they foster the autonomy of individuals through mutual support.

Throughout the book Weeks stresses the social supports needed for autonomy and the importance of rights, not in order to escape or construct barriers against others but to enter and be included. In this he is joined by feminist theorists of care as well as communitarians of all stripes. Indeed, the catchwords of "responsibility," "respect," and "care" are as much central to New Right discourse as to progressive politics in the past two decades. Weeks devotes several pages in the last chapter to distinguishing his understanding of care, responsibility, respect, and knowledge from those of the British New Right, for whom these words have signaled the need for privatization of social services, traditional values, and the exclusion of alternative family forms. For Weeks these values are part of an ethic that can stand in the face of death, exemplified by the devastation of AIDS. As he puts it, a recognition of our "equality of vulnerability" in life and death should form the foundation of our values and our rights (p. 141).

If Weeks's largest concerns are communitarian, his particular awareness of marginalization and oppression leads him to a healthy respect for individual rights. Like Lehr, Weeks's concern for care and his appreciation of contingency and construction take him beyond individualism. Unlike Lehr, however, Weeks's rejection of individualism does not lead him to abandon rights; as he says, "the inadequacy of rights-based arguments lies not in the claim to right in itself, but in the absence of a wider social context in which the notion of rights becomes meaningful" (p. 141). Rights should not be seen as the possession of sovereign selves but as an element in the shape of relationships between incomplete and vulnerable selves. It is not our sovereign subjectivity that merits and demands rights but our need for protection and support.

The neediness of the self runs through all the works reviewed here. This is not simply a theoretical fashion or trend. Much less even than gender can we imagine a politics of sexuality that does not center the self in need of others. Sexuality is understood relationally, even in the absence of actual sexual partners. We might imagine sovereign selves in sexuality as in politics, indeed,

many desire exactly that; but bisexual, lesbian, and gay theorists in all fields have made clear the centrality to sexuality not only of relationship but also of vulnerability. For some this relationality seems to mandate a rejection of liberalism, but just as powerful is its reformulation with stronger "communitarian" ontologies. Basing rights not in a sovereign self but in a constructed and vulnerable one makes all the difference. This vulnerable self does not demand privacy, but needs it in order to associate with the intimate and perhaps not-so-intimate others who make up its world. As Morris Kaplan shows us in Sexual Justice, this vulnerability fosters what is best in liberalism over its atomistic contenders,

Although Weeks is part of this reformulation of liberalism, in the end his book is disappointing. Those new to the field will find much to stimulate them, and its lucidity makes it useful in classes, but political theorists will likely find that Weeks does not offer new ideas. This is not a consequence of training but perhaps rather a matter of caution: He seems to see the merit in every view, and explains that merit clearly, but he continually backs away from points that might be controversial. Weeks has interesting ideas, and his analyses of the linkage among rights to difference, to space, and to exit and voice (chap. 4) are often original. but he too rarely argues those points; instead, he asserts and cites others. For example, Weeks does not abandon the idea of authentic sexuality, so central to the modern Western experience of the self, but he proposes to understand it not as "realization of a true self, or a dissolution of the self in the pursuit of polymorphous pleasures," but in the context of "the meaningfulness of our practices of freedom" (p. 69). Yes, I think, but then wonder: What exactly does he mean? It is clear what he rejects (Thatcherite conservatism), but what exactly is he recommending? Annoving hints such as this too often substitute for argument. I found myself agreeing with him but was rarely surprised or challenged.

There is more challenge in Steven Seidman's Difference Troubles. The author begins from quite a different place and assumes a different audience. This fine book consists of several essays published over the last twelve years and many new ones (indeed, there are too many chapters, which results in some repetition). Seidman's theme is the rejection of difference in both sociology and in social theory and politics and the need for a "pragmatic turn" in social theory. The first five chapters address the resistance of sociological theory to conceptualizing otherness, especially sexual difference. The second and third parts move directly to questions of sexual identity in postmodern culture before returning to epistemological concerns, and an epilogue briefly explicates Seidman's view of the relation among pragmatism, difference, and democracy. Perhaps reflecting his position in the U.S. academy rather than the British, Seidman offers extensive notes on the role of religion in education and the diversity of public spheres, and his view of postmodern societies, although largely in accord with Weeks, is much more nuanced.

Seidman's overarching argument is that social theory

has been unable to conceive of differences other than as "problems." He links methodological issues to political and ethical concerns and argues that "epistemological pluralism" and "postdisciplinarity" are not only methodological virtues but also political ones, for "a vital, democratic intellectual culture should include, at its core, the recognition of epistemic and social differences" (p. 41). He faults contemporary sociological theory for abandoning the "moral intent" that he sees as integral to the history of social theory. Political theorists will recognize his critique of a narrowly quantitative sociology and the theory entwined with it as reminiscent of the concern for the political as well as conceptual consequences of behaviorism elaborated by Charles Taylor (1985) and William Connolly (1980). Like Weeks, Seidman hopes that social theorists will again become participants in "elaborated social and moral argumentation over consequences and social values" (p. 59) rather than isolated specialists divorced from public discussion. The criteria for evaluating social theories would be "pragmatic," with an eye to "their intellectual, social, moral, and political consequences" rather than "absolutist justifications," "theoretical logics and epistemic casuistries" that remove them from their contexts (p. 50).

All very well, but one might ask: But what has this to do with queer politics? Seidman has several answers. First, his indictment of sociological theory is focused through that theory's neglect of sexuality: "If our view of modernity derived exclusively from the sociological classics, we would not know that a central part of the great transformation were efforts to create a sphere of sexuality, to organize bodies, pleasures, desires, and acts as they relate to personal and public life" (p. 82). Contemporary sociology incorporates sexuality, but often in ways that do not reflect the concerns or self-understandings of those studied. Those who attempt to "queer" sociology are met not only with sexual stigma but also often with methodological and episemological restrictions that prevent the recognition and study of "sexual regimes," those structures of "sexual meanings, discourses, and practices that are interlaced with social institutions and movements" (p. 86). The study of such regimes is central to the development of both social and political theory away from treating the politics of sexuality as simply another interest group or identity.

Seidman is at his best in the middle chapters. He offers one of the most accessible and helpful treatments of the difference between "studying queers" and "queer theory" that I have read. Unlike "studying queers" (or gays, lesbians, bisexuals, and transgendered people), in which a population is examined using the methods and perspectives "appropriate" to a discipline (e.g., voting studies, the history of lesbians and gays in a given time/place, the effect of violence on sexual minorities—what feminists referred to as the "add women and stir" approach—queer theory begins from the positions and perspectives of sexual minorities in order to reread the social world. Queer theorists have resided primarily in literature and humanities departments, but writers such as Judith Butler (1990,

1993, 1997), Eve Sedgwick (1990, 1993), and David Halperin (1990, 1995) are widely read by scholars in social science departments. Queer theory is overwhelmingly poststructuralist, looking for the ways that sexual identities are constructed in social movements, texts, films, and other cultural media as well as in law and politics. Queer theorists also focus on "queering" ideas, concepts, and practices that are currently exempt from scrutiny, looking both for the ways that queers might become more included or central and for the changes required in the categories for that to happen.

Although much queer theory is now read and taught in sociology and political science departments, humanities scholars have not made comparable use of social science scholarship. Seidman challenges the division between humanities and social science, demonstrating that queer theory has as much to learn from social science as social science from queer theory.2 He faults the lack of "institutional analysis" in queer theory, a lack that produces readings divorced from historical or sociopolitical research. Seidman offers a historical sociology that traces the development of modern gay and lesbian identities and offers a concrete location for critique of the new "ethnic politics" of gays and lesbians. He makes good on the promises of queer theorists to demonstrate that queering identity politics fosters a linkage between specific group politics and a broader democratic agenda.

The concluding chapters of Difference Troubles return to the theme of difference and epistemology, this time through explicitly normative concerns about sexual ethics. Seidman advocates a "communicative sexual ethic" in place of the "morality of the sex act." He argues that the site of normative dispute is not acts or individuals but sexual communities that negotiate over meanings, "moral logics," and institutions (p. 226). A communicative sexual ethic, he suggests, would provide that judgments be "focused on particular acts and ... guided by contextually informed, minimalist, and consequentialist reasoning," with the result that "large stretches of social practice related to bodies and intimacies would lack moral weight" (p. 232). The guiding values of such an ethic would be consent, responsibility, and reciprocity. Seidman is confident that such a "formalist" position affords the best hope for negotiating sexual difference in modern democracies.

Although (or perhaps because) these chapters are the most directly addressed to debates in political theory, they are also the most frustrating. Issues such as sex between children (which he prohibits) and sadomasochism (which he allows) are held to be quite straightforwardly resolved by such an ethic, but reasons are not always sufficiently elaborated. What do "we" mean by "responsibility" in communicative practice? Far from buying general agreement, Seidman's formulation postpones the inevitable conflict over nonformalist substantive values. Because he has substantive

commitments that he knows are controversial, Seidman begins the liberal strategy of bracketing issues from substantive discussion. This leads him to betray other commitments he has made. Seidman's rejection of "reason-based consent" in favor of substantial areas of "pragmatic accommodation" belies his earlier nuanced postmodernism, which persuasively rejected the split between reason and interest. Indeed, notions of consent and responsibility rely on some idea of reason for their content. We might suggest that Seidman's target is the disembodied reason of the foundationalists he abhors, but we should have more guidance from him as we do so.

It must be noted that neither Seidman nor Weeks seems to thoroughly "get" feminism. This is most evident in Weeks, who seems to have no knowledge of feminist scholarship and too little awareness of women's continuing subordination; for example, he characterizes a British feminist journalist as "not marginalized but on the contrary much admired" (p. 166), as though these two are mutually exclusive. The lack appears as well in Seidman's contention that, unlike issues such as the choice (and age) of one's partner and what consenting adults do together, issues clearly derived from battles over gay and lesbian rights, questions of pornography, and abortion rights are "outside the purview of the communicative sexual ethic" (p. 235). These issues will be "resolved at the level of interest and pragmatics." But why should this be? Why does his sexual ethic speak directly to the sexual concerns of one group but not of another? Why are consent, responsibility, and reciprocity so feeble before these questions? Consent and reciprocity seem central to evaluation of pornography, and consent, responsibility, and reciprocity (not only between sexual partners, but between pregnant women and the state) have been key ingredients in the abortion controversy. The relevance and scope of this ethic is not a given matter at all, not in the nature of the questions, but is itself a result of "interest and pragmatics"—in this case, Seidman's interest in sexual freedom for gays and lesbians (qua sexual minorities, rather than lesbians qua women). We can see, then, that working from "the perspectives of gays and lesbians" is not more complete than other perspectives but simply shines the light differently. It does not supplant, but complements, other angles of view.

The treatment of sexuality in isolation from other avenues of power will only take us so far. Like feminist theorists who treat women as implicitly heterosexual, or whose understanding of lesbianism is limited to the "womanness" of it, lesbian and gay theorists who attempt to study sexuality in isolation from race, gender, and economic structures will inevitably provide partial answers at best. Although conceptual separation of systems is useful at certain moments, that separation cannot violate the complexity of lived reality without doing damage to our ability to formulate rights and responsibilities that address the range of needs and conflicts that we encounter in our common life.

In contrast to Blasius and Lehr, who deny a liberalism that they nonetheless seem unable to abandon,

² It should be noted that Seidman has contributed mightily to this synthesis through his edited collections, *Queer Theory/Sociology* (1996) and *Social Postmodernism* (edited with Linda Nicholson, 1996).

Seidman and Weeks offer a pluralism, perhaps even (in Weeks's case) a liberalism, that remains incognito. They adopt positions and authorities that are understood themselves as part of an enlarged liberal project, but they avoid the name that now seems synonymous with abstractions that have been roundly discredited in postfoundationalist theory. In Sexual Justice, Morris Kaplan both defends and extends liberalism, but his liberalism is substantially richer than Sullivan's. His aim is "to go beyond the thin conceptions of legal personality and negative freedom that inform liberal theory and to insist on the concrete social dimension of the assertion of equal citizenship by lesbians and gays" (p. 13). This is quite explicitly not a repudiation of liberalism but a renewal. Kaplan begins from the three "moments" or kinds of claims currently being made: for decriminalization of acts between adults; against discrimination in housing, employment, and accommodations; and for "legal and social recognition of the ethical status of lesbian and gay relationships and community institutions" (p. 14). He demonstrates how these may be justified through (quite different) liberal principles. The first claim may safely rely on negative liberty and the "right to be let alone," but the others require quite different grounds. The second, in common with other civil rights struggles, asks the state to function as a positive guarantor of fairness. The third, as many opponents correctly suggest and defenders often hedge about, requires a commitment to "the moral legitimacy and ethical validity of lesbian and gay ways of life" (p. 17).

Rather than craft an argument that subsumes homosexuality into a more general claim about sexual autonomy, as Weeks does, or focus on gays and lesbians so specifically that heterosexuals may feel themselves to be spectators at an internal debate, as may happen for both Blasius and Lehr, Kaplan simultaneously addresses the specificities of lesbian and gay ways of life (and notes their plurality) and provides general principles for understanding the relation between sexuality and politics. Three chapters act as bookends, addressing the historical construction of lesbian and gay identities and arguing for the three claims described above. These chapters are linked through chapters on Plato, Freud, Arendt, and Thoreau, in each of whom is found components of the author's larger argument. From a reading of Plato's Symposium Kaplan discerns a general "queerness" in sexuality that "derives not simply from its resistance to whatever social norms are historically in place but rather from its figuring of neediness and excess in a dynamic interplay that reveals the human condition as inherently divided and incomplete" (p. 83). This dynamic prevents us from certainties about hierarchies and oppositions between "masculine and feminine, straight and gay," and so might afford us greater humility in our judgments and conclusions. Just as important, the distance between Plato's world and ours, including Greek acceptance of pederasty and the gap between pederasty and modern homosexuality, reminds the reader of the historically bounded nature of ideas about sexuality.

Plato's recognition of the role of the erotic in binding

male citizens is pursued in the chapters on Freud and Thoreau. Freud's teaching of "the pervasiveness of sexuality and the multiplicity of its forms" (p. 118), which has made him so central to contemporary queer theory, also should be important for political theorists seeking to understand the foundations of common life. Thoreau emerges from Kaplan's pen as a teacher of interdependence and friendship, of homoerotic (masculine) democracy. More important for his argument, however, is Kaplan's reading of resistance not as the act of isolated individuals but as a form of action through which "even the worst off" may exercise agency while exhorting "those better off to recognize their involvement in the fates of all who are excluded or marginalized by contemporary regimes" (p. 185). Resistance is a central locus of self-creation and the formation of desire.

Self-creation is central to Kaplan's discussion of Arendt. Arendt treats the public sphere as the central location for self-making and disclosure, both as individuals and as groups. This does not mean, however, that "the public" is the only important location for citizens. Kaplan follows through on his commitment to link theory to concrete circumstances by focusing on Arendt's more directly engaged work, such as her essays on Jewish politics and The Origins of Totalitarianism. He extends Arendt's brief discussion in Origins of the comparisons between Judaism/Jewishness and sodomy/homosexuality, in which she acutely notes (without Foucault's help) the rise of the "homosexual as personage" with an etiology, characteristic flaws, and so on, and sees in it the same hand of medicalization that creates "Jewishness" as a quality extending far beyond religions or cultural specificity to describe an essential type. In both cases, Arendt observes that the transition from "crime" to "vice" was not a benevolent improvement for subject populations. Such transformation allowed the bourgeoisie to combine a fascination with the "interesting" homosexual or Jew with scorn or hatred for the mass of those populations (Arendt, 1968, 80ff). Through readings of contemporary scholars in queer theory and Jewish studies, Kaplan develops Arendt's remarks to argue against essentialism. Kaplan links the critique of essentialism to the goal of equal citizenship, citing Arendt's belief that self-creation is central to democracy. Those whose practices of self-creation are banned, or whose practices construct identities that are legally stigmatized and devalued, are not full citizens. They will instead ride the see-saw of parvenus and pariahs, "good homosexuals" and "bad queers" (Smith 1997), a see-saw shared with racial, religious, and national minorities.

The final chapter returns to contemporary politics to argue for lesbian and gay marriage. Unlike neoconservative gay authors on the subject, such as Sullivan and Eskridge, Kaplan does not argue that marriage is important for "civilizing" men or that it is uniquely sanctified among forms of human relations. Nor, he asserts, should monogamous, sexually exclusive marriage be privileged among family forms. Returning to the discussion in the first chapter of Blackmun's dissent in *Bowers*, Kaplan argues that relational autonomy

requires public recognition of the relationships that give meaning to our lives and that marriage is the premier vehicle of this recognition (p. 210). The fight for marriage is for him the most visible manifestation of the shift from "a defensive fight for mere survival towards an effort to secure the social conditions of human flourishing on equal terms with other citizens" (p. 211). These conditions, furthermore, cannot be mandated but must be continually reinvented and negotiated, as Kaplan's defense of bathhouses and sex clubs demonstrates: He argues for them on the same relational basis he employs for marriage.

In this defense of a "variety of institutions of intimate association" (p. 238), Kaplan reiterates the theme that runs through all these works. Along with Blasius, Lehr, Weeks, and Seidman, Kaplan draws on the experiences and institutions of lesbian and gay life in contemporary Western democracies to adumbrate an understanding of the relation between individuality and relationality that appears in various guises in Hegel, Tocqueville, Mill, Dewey, and Arendt. These authors are not generally treated as a "school" or a "natural group," but they share a distinctively modern concern for individuality and freedom that is combined (in quite different ways) with a "communitarian" recognition of the social networks that create and sustain individuals. Even Kantian liberals, who tend to highlight the individual in contrast to her environment, have learned this lesson. Yet, the slip from the general to the particular is where many liberals fail (in varying degrees) to afford sexual minorities the purchase they need to gain recognition as equals. Abstract individualism is not the only threat to actual equality; more concrete or communitarian formulations that theorize solely from heterosexual presumptions also fail to account adequately for the other possibilities that are the daily realities of many. Our authors demonstrate that the major social cost of lesbian and gay existence is not (only) formal or legal exclusion but the invalidation of the ethical legitimacy of our lives. Denied acknowledgment, we are stripped of the supports of family that heterosexuals take for granted. This denial has spurred a host of creative institution-building, but it is denial nonetheless. Being barred from the bedsides of our loved ones (or their funerals) because we are "not family," rejection from our families of birth (or acceptance conditional on pretending not to have relationships), and unanswered vilification in public are as damaging to the creation of the individuality vaunted by liberalism as physical violence and legal

The authors under consideration here all recognize that such a situation requires the remedy of rights, but they clearly disagree about what rights mean. Blasius's formulation of relational rights suggests that they are needed specifically in order to counter disciplinary power, whereas Kaplan, Weeks, and Seidman argue from a more general recognition of the limits of abstract individualism and the need to locate subjects and their rights in the larger contexts of their lives. Lehr, the sharpest critic of rights, argues for the necessity of meaningful changes in economic systems if

rights are to be effective for more than a minority. The fact of their agreement that rights are needed, while they offer different (sometimes overlapping) arguments for rights, leads us to wonder what each finds in rights that is so important. Simplifying, I would say that the shared thread they find is protection. As Patricia Williams (1990) has noted, white critical legal theorists may reject rights with more confidence than do critical race theorists precisely because they are less endangered in a world without rights. Like racial minorities, sexual minorities find themselves in need of rights and rights talk to protect their lives, their relationships, and their presence in schools, at work, and in a host of other institutions that might otherwise simply dismiss or persecute them. Even the most critical of queer theorists returns to rights when needed.

Of course, there is more to liberalism than rights. Liberalism includes claims about the sanctity of the private (neatly marked off in ways that never quite succeed)—the separation of church from state, economy from government, and bedroom from polity-that provide endless ground for rearticulation. Liberalism's principles of tolerance leave it open to castigation from right, left, and elsewhere. Yet, liberalism funnels all these controversies through the narrow path of rights. And it is precisely the intense need for rights that continually leads minorities to reencounter, reformulate principles that are so obviously defective on logical, ontological, and (finally) political grounds. In the current state of things, only a close relative of liberalism can assist those who seek to live among the heterosexuals. That does not mean that they must endorse a particular version of liberalism; these books make clear that liberal concerns are not always or only addressed by Rawls or Dworkin or Habermas, and that "liberal concerns" might include the needs of a vulnerable self for whom relationships and recognition are as basic as the need for food. Although these authors range in their attitudes toward liberalism, from Kaplan's defense to Lehr's critique, in the last analysis they do not so much dispose of it as transpose it to another key. This transposed liberalism allows for complex melodies of interdependence in which that interdependence requires not conformity and unity, as more faithfully communitarian siren songs have claimed, but proliferation of opportunities for selfcreation. As radical democrats such as Chantal Mouffe (1993) argue in criticizing Rawlsian liberalism, and as Seidman and Weeks emphasize, this proliferation does not lead to chaos but to new counterpoints that enrich the theme of liberty and equality.

Social change is enabled, as well as blocked, by the institutions of liberal democracy. These institutions, in turn, depend upon citizens' understanding of their importance for their lives as individuals and as a community. In their concern both for their particular communities and for the relation between those communities and wider polities, these books all speak to the heart of political theory—who we are and how we live together. Readers of all persuasions will find much to work with in these books, and in the scholarship that they make possible.

BOOK REVIEWS

Political Theory

Ethics for Adversaries: The Morality of Roles in Public and Professional Life. By Arthur Isak Applbaum. Princeton, NJ: Princeton University Press, 1999. 288p. \$29.95.

Dan Sabia, University of South Carolina

Impressive substantive knowledge, analytical rigor, and Kantian and liberal democratic commitments are all in play in this careful exploration of the morality of roles in adversary institutions. Extending the concept from its usual location in accounts of legal, especially criminal, representation in the American legal system, adversary institutions and professions are conceived as practices in which role players like business executives, lawyers, public officials and bureaucrats adopt partisan and limited, and therefore often conflicting, perspectives and interests, and claim the right to intentionally harm others, on the ground that such partiality, conflict, and conduct will help promote or secure valued outcomes or goods such as prosperity, justice, and legitimate government.

The "central question" addressed in the book is how acting in an adversary institution and role can morally justify or "morally permit actions that otherwise would be morally wrong" (p. 10). Many common justifications are examined, and all are found to be "weaker than [often] supposed." Adversary "institutions and the roles they create ordinarily cannot mint moral permissions to do what otherwise would

be morally prohibited" (p. 3).

A very brief account of the main justifications considered, and criticisms made, follows. Adversaries may try to defend themselves by appealing to role prescriptions, including permissions to harm, as if their mere existence justified compliance. But the argument of chapter 3 is that roles have no "independent moral force or ... grounding," and therefore cannot by themselves create moral obligations or permissions to do anything, much less anything wrong (p. 45). Another defense, explored in chapter 4, is that a role which has moral value imposes on its occupants moral obligations "to defer to authority and comply with its rules," including the common rule demanding neutrality, or the suspension of personal judgment regarding the substantive merits of what one is supposed to do (p. 60). Focusing on civil servants in a liberal democratic setting, the author contends to the contrary that the suspension of political and moral judgments regarding both the legitimacy and justice of authoritative orders and policies is unacceptable since the morality of the role and its obligations presuppose the legitimacy of both and of any actions they may prescribe. Unreflective deference is never justified; resistance and disobedience sometimes is.

Ensuing chapters canvass more interesting and challenging defenses. Chapter 5 examines "the strategy of redescription" or the claim that professional practices and roles "create new ways of acting that can be judged only by the rules of the practice" (p. 10). Rules governing the legal profession, for instance, permit or require a variety of deceitful actions which, however, are said to be misdescribed as deceitful; actually, these actions are forms of zealous advocacy, and they are legitimate, even obligatory, and cannot possibly be moral wrongs. Acknowledging that this strategy tracks compelling accounts of how social practices can constitute action descriptions (by, e.g., John R. Searle, Speech Acts, 1969), the author nonetheless mounts a successful critique of it. The essential point is that the strategy fails because it forgets that institutionally constituted action descriptions (or redescriptions) are not exclusive or even privileged. Although it is true that "practice-defined descriptions can be judged only by the terms set out by the practice," it is not true that a "practice-defined description is the only apt description" (p. 91). Thus, while advocacy that involves misleading jurors or litigants is on most accounts of legal practice truly good or competent legal behavior, it is also deceitful behavior that needs to be, if one cares about morality, justified. Moral scrutiny is not blocked by redescription.

Another justification of harmful advocacy behavior, discussed in chapter 6, appeals to rules of the game. The defense is that victims consent to, or as a matter of fairness must accept, their treatment, much as players in a game of poker must accept being targets of deceit. The key criticism of the consent argument, made before by many writers (e.g., Sissela Bok, Lying, 1978, and Dennis Thompson, Political Ethics and Public Office, 1987), is that it asserts what is usually false: Victims of adversary practices typically do not consent to being mistreated. The argument from fair play reflects a careful reworking of well-known literature asserting, and questioning, the idea that persons may incur obligations to do their part in a just scheme of cooperation by virtue of their voluntary acceptance of benefits provided by others in that scheme; the reworking holds that permissions to harm persons are justified if they accept or receive benefits in a just scheme. The author's basic criticism of this argument is that, at least in games of market competition, electoral politics, and adversary law, consumers, citizens, and litigants are typically neither advantaged by, nor do they voluntarily seek, the games' benefits. "Business managers, public officials, and lawyers may satisfy the conditions of fair play in their deceptive or coercive dealings with one another," however, so when they are deceived or coerced they "may have no reasonable grounds for complaint" (p. 135).

In the longest and most technical chapter of the book, chapter 7, the author explores defenses that reflect and develop debates between consequentialists and Kantians concerning the permissibility of intentional harm. Considerable effort is expended establishing a "conceptual case for morally permissible violations of persons [on nonconsequentialist or Kantian grounds]" (p. 173). When refusing to violate a person(s) is "self-defeating" because the person(s) will suffer a more serious violation as a result, or when refusing is "Pareto-inferior" because the person(s) will suffer anyway and others will as well, a Kantian can ("with reluctance and regret") justifiably violate the person(s), knowing that "reasonable" persons would, ex ante, consent to such treatment (pp. 150, 165). After making this "conceptual" argument, the author (with unintended irony) explains that it provides little help for those who would defend most of the violations adversary practices permit, since those practices typically permit violations in circumstances that would not warrant reasonable consent (although there are exceptions which the author describes).

A final defense, or set of related defenses, is examined in chapter 7, where the focus is on appeals to the social goods secured by adversary institutions. One central criticism of such appeals is that they characteristically exaggerate the good results adversarial practices manage to produce. Another is that, even if some adversary practice does produce, overall, good outcomes, this can at best justify institutional permissions to harm but not, necessarily or automatically, intentional harming. This is so for two reasons: First, particular cases of harming may not serve, they may even undermine or subvert, the ends which justify institutional permissions; second, even if the end and action of an adversary agent in a particular case does serve good institutional purposes, intentionally harming others is not thereby justified. Good ends alone do not justify wrongful behavior.

This last point, of course, is a conclusion compelled by the author's commitment to Kantianism; it is not, therefore, wholly compelling. It would not persuade adversaries and defenders of adversarial practices who knowingly embrace some variety of moral consequentialism. Perhaps the central weakness of this thoughtful book is the author's admission that "if consequentialism is the correct moral theory, there is no serious objection to an adversary institution that produces enough social good to outweigh... the bad" (pp. 176-7). A related weakness is his relative neglect of what might be termed the phenomenology of role playing, which can explain not only why adversaries and other role occupants may be deaf to the demands of morality but also may make particular moral judgments of which he cannot approve (see, e.g., Elizabeth Wolgast, Ethics of an Artificial Person, 1992).

Because I have focused on the central question addressed by the author, I have neglected other chapters, and virtues, in the book. Well-written, full of interesting cases and real and imagined examples, Applbaum has drawn on much of his previously published work to present an illuminating and forceful critique of the arguments even good people in professional and political life employ to justify the bad things they do. For those interested in role morality and professional ethics, and who appreciate the style and results of analytical moral and political philosophy done by the likes of Nagel and Williams, Rawls and Dworkin, David Luban and Dennis Thompson, Ethics for Adversaries is a must read. Undergraduates would probably find it a hard go.

Why I Am Not a Secularist. By William E. Connolly. Minneapolis: University of Minnesota Press, 1999. 210p. \$29.95.

J. Donald Moon, Wesleyan University

This is the latest in a series of works in which Connolly has been interrogating liberalism and its fellow travelers. Drawing on thinkers such as Nietzsche, Foucault, Deleuze, and Arendt, he has become one of liberalism's deepest and most original critics today. And he is one of liberalism's most valuable critics, in part because his own intellectual journey begins with the experiences and preoccupations that led to liberalism. This is evident in the title of this work, which echoes and pays homage to Bertrand Russell's Why I Am Not a Christian, a text that is very much in the tradition of the secularism Connolly criticizes. It is also reflected in an engaging biographical story that introduces the work, in which Connolly describes how at a tender age he came to be an atheist. But for Connolly, liberalism generally and secularism in particular do not provide viable accounts of these experiences, or answers to these concerns.

Connolly conceives of "secularism" broadly, as the "wish to provide an authoritative and self-sufficient public space equipped to regulate and limit 'religious' disputes in public life" (p. 5). Thus, secularism offers itself as the alternative to the aggrandizing claims of religious truth to constitute the moral and political center of society, an alternative that becomes increasingly attractive as religious truth becomes religious truths and competing visions lead to sectarian conflict and violence. But in offering itself as the new center for political life, secularism commits the same errors as its traditional antagonists; although only one voice in the conversation, it sets itself up as the single, authoritative source to adjudicate the differences among the others. In doing so it fails to see its own limitations, and it creates its own forms of dogmatism and intolerance, which, ironically, intensify the

very forms of sectarian conflict that it was intended to overcome.

Perhaps the greatest failing of secularism is its faith in reason, or rather a certain conception of reason, one that is blind to what Connolly calls "the visceral register of subjectivity and intersubjectivity" (p. 24). Drawing on various sources, including recent brain research, Connolly insists that thinking, remembering, and feeling cannot be reduced to or modeled in terms of conscious, linguistically formulated processes of thought. Ethical life, similarly, should not be seen as enacting (or conforming our actions to) our beliefs and ideals but includes practices that actively engage "the visceral register of being" (p. 29). Public life cannot even in principle be a matter of pure argument delivering authoritative judgments that all rational citizens must, on account of their being rational, accept; rather, it is "always accompanied and informed . . . by visceral intensities of thinking, prejudgment, and sensibility" (p. 36). And that can be a good thing, since it can lead to creativity and new forms of communica-

Not surprisingly, if there is a single figure with whom Connolly is wrestling in these pages, it is Kant and his contemporary descendants, notably Habermas and Rawls. Much of the book consists of sustained engagements with these figures, but it also addresses the political failings of a secular vision of politics, including the war against drugs, the use of the death penalty, and the debate over a right to assisted suicide. Running throughout these analyses is what we might call a therapeutic intention, an effort to wean us away from the need for unity, for structure, for authoritative centers and control. One of Connolly's favorite images is the rhizome, literally a root-like structure consisting of a system of interconnected roots, tubers, stems, and so on, with no single or main stem to which they all feed. Culturally and politically, Connolly calls on us to embrace what he calls 'deep pluralism," whereby we are connected to others in a variety of ways, organizing ourselves into a complex array of partially overlapping and intersecting associations, without the need for a common center, whether it be the idealized nation or the majesty of public reason or even the purity of Arendtian politics. Against the secularist strategy of insulating political life from contested religious or metaphysical views, we should embrace a politics of contestation in which conflicting perspectives are admitted into political life. By embracing these conflicts, rather than seeking to transcend them, we are more likely to come to see the contestability of our own moral sources and to discover new possibilitiesnew questions, new ways of engaging with others, new alternatives. The strategy of secularism was an effort to avoid conflict by retreating to an ever more rarified conception of the public realm, and it has failed. Instead, we need a "democratic ethos of engagement across multidimensional lines of difference" that is "jointed to a sensibility that affirms the ambiguity of being and the deep contingency of things" (p. 186).

This is an attractive vision. Connolly is correct to argue that the "reciprocal acknowledgment" by all that "no party has shown its perspective to be undeniable" could widen the scope for a "politics of forbearance, generosity, and selective collaboration between interdependent partisans" (p. 187). But one wonders how real a break this is from the politics of secularism. In the first place, secularism also demands that we reciprocally acknowledge the contestability of our own positions, and it is precisely this demand that has been—and is being—resisted by those who seek to embody their own ideals in legislation and public policy. But more important, it is hard to see how Connolly's "ethos of forbearance and

generosity" could dispense with the basic strategy of secularism. While admirable in avoiding false claims to finality and universality, rhizomatic pluralism would, like secularism, have to limit the scope of political authority and action to create spaces within which differences can be expressed and partial, limited collaboration among antagonists could be achieved. Furthermore, an ethos of forbearance and generosity could hardly endorse the use of political power for ends that citizens have good reason to reject. Perhaps these similarities are not surprising, for Connolly does not reject secularism but, rather, seeks to chasten it.

The Dark Side of the Left: Illiberal Egalitarianism in America. By Richard J. Ellis. Lawrence: University Press of Kansas, 1998. 426p. \$34.95.

Don Herzog, University of Michigan

In this elegantly written, provocative, and sometimes just plain provoking book, punctuated by bits of anguish and rather more pique, Richard Ellis worries that the American Left has been so passionate about equality that it has run roughshod over liberty. So put, the thesis is not exactly news. It has been the recurrent lament of conservative indictments—Tocqueville's is the canonical statement, but he has plenty of precursors and followers. And it has its scholarly variations, too, such as Arthur Lipow, Authoritarian Socialism in America: Edward Bellamy and the Nationalist Movement (1982). No profound surprises are on offer here.

So what does Ellis bring to the hoary old wisdom? For one, he writes as himself a liberal, "a card-carrying member of the American Civil Liberties Union and an avid supporter of public broadcasting and Big Bird" (p. ix). He is unwilling simply to write off leftist causes as so much pernicious tripe, so his criticism does not just sound different; it has different force. For another, he does not rest content with stylized abstractions, or the same old two or three fabled stories you have heard countless times before. The book is a colorful and detailed, if opportunistic, tour through American history. Ellis has done some primary research, but he also draws heavily on familiar published works by American historians. Then again, historians have something to learn from his blunt and well-done challenge to Richard Hofstadter's influential view that we should see this illiberal terrain as the property of paranoid right-wingers.

The tale opens with abolitionist opponents of slavery, whose fierce moralism, their conviction that slavery was evil incarnate, made them famously uncompromising. (I do not think Ellis quite wants to counsel, against Garrison, compromise with slaveholders, but he does want to warn us right away of the political dangers of striking such a pose.) One might wish the tale had started earlier, indeed, as early as the Puritan settlers and their sustained efforts to run pure, even holy, commonwealths. It would be nice to know what, if anything, changed after the ratification of the Constitution and the arrival of the United States of America.

Ellis moves on, rapidly, through tours of utopianism from Bellamy to Llano and left-wing contempt for the "masses" of ordinary people from Walt Whitman to communist writer Mike Gold. Picking up steam, he offers a genuinely savage skewering of the New Left, its romanticization of the lumpen-proletariat and other benighted groups and polities, and the pathologies and idiocies surrounding their abortive campaigns to have political organizations without leadership or authority. Turning a now thoroughly jaundiced eye to the contemporary scene, Ellis pillories radical feminists—his

account of Catharine MacKinnon is blurry at best, sometimes downright misleading—and environmentalists.

There is much food for thought here, but too much of the digestion is left for the reader. Ellis owes us a more precise account than the one he furnishes of just which versions of "equality" conflict with just which versions of "liberty." If you think equality means everyone has identical income and wealth, and liberty means an unregulated free market, then hey, prestol the two conflict. But suppose you think equality is a matter of the state ignoring the religious attachments of its citizens; of the law ignoring irrelevant facts about race, poverty, sexual orientation, social status, and the like; more generally of all institutions' ignoring contextually irrelevant facts. This is itself just a classical liberal demand. Does it conflict with any interesting sense of liberty? Or, indeed, is it partly constitutive of what we mean by liberty?

Or try this: Ellis's strategy is to locate leftists who say and do disturbingly illiberal things and then notice that they are egalitarians. But it does not yet follow that their egalitarianism is the source of their illiberalism. Are egalitarians always illiberal? (Ellis acknowledges that William Randolph Bourne's "radical egalitarian vision" [p. 99] offers much for liberals as well as radicals, but then he suggests very quickly that it cannot be sustained for long. I suppose Bourne died too young for us to be sure. To give one of many examples he simply does not discuss, what of the politics that led Emma Goldman and Alexander Berkman to abominate both World War I America and its hundred-percenters and the Soviet Union?) Ellis notices (pp. 279–84) that more remains to be said on this subject, that the historical vignettes cannot interpret themselves or settle anything.

Fair enough. But in fact, his own book says more. For instance, Ellis has intriguing things to say about radical and utopian social organizations that cut off contact with the broader society, painting it as corrupt; and about how such dynamics help set up or reinforce Manichaean us/them distinctions that invite contempt for the other. So the machinery he actually develops has more working parts, more nuance, than any simple wire running straight from equality to illiberalism. My suspicion is that the most we can say in these matters is that there are loosely knit, highly contingent, but still recognizable constellations of political positions featuring both some kinds of egalitarianism and some kinds of illiberalism, and that it is just mistaken to assign priority to any one position in such constellations. But even if I am right, this would not make it sensible to set aside Ellis's book. His evidence and argument are better than his title and official statement of purpose suggest.

New Wine and Old Bottles: International Politics and Ethical Discourse. By Jean Bethke Elshtain. Notre Dame, IN: University of Notre Dame Press, 1998. 104p. \$14.95 paper.

Douglas P. Lackey, Baruch College and the Graduate Center Ctty University of New York

This book provides a revised text of Jean Elshtain's Hesburgh lectures, delivered at Notre Dame in 1996, together with comments by Fred Dallmayr, Martha Merritt, and Raimo Vayrynen.

Élshtain, Laura Spelman Rockefeller Professor of Social and Political Ethics, University of Chicago Divinity School, combines in her books a capacity for philosophical dialectic with a keen eye for historical detail, somewhat in the manner of Hannah Arendt, whose mantle, these lectures show, she has inherited. There is the same sense of deep moral concern, the same ability to view history from an almost Hegelian

height, the same impression of historical processes unfolding with tragic grandeur, the same somewhat paradoxical emphasis on individual responsibility in the midst of these processes.

The grand concepts around which these lectures are organized are sovereignty, nationalism, and forgiveness (in the sense of forgiving political injustices, not personal affronts). The first two concepts blur together in the phrase "national sovereignty," but Elshtain distinguishes them by distinguishing their histories. The notion of sovereignty was developed by such late-medieval theorists as Jean Bodin and found concrete expression in arrangements associated with the Treaty of Westphalia; it insists on the distinction between "external matters" and "internal matters" (usually via reference to geographical borders) and defines sovereignty as final control over internal matters. The program of nationalism was developed by late-eighteenth-century thinkers and found concrete expression in nineteenth-century antiimperial and twentieth-century anticolonial movements. It insists that membership in a nation is essential to personal identity and maintains that suppression of distinctive national ways of life is an evil more grave than war. The two concepts combine in the principle of national self-determination, which seeks to remedy the political suppression of national life by assigning to each nation or people a separate sovereign state.

It is a weary fact of recent history that movements for self-determination do well in overthrowing oppressive empires but do poorly in suppressing their own chauvinistic urges. Given a conceptual separation of sovereignty from nationhood, the apparent remedy for the excesses of nationalism is the relocation of sovereignty in transnational entities. But Elshtain steadfastly refuses to give up the primacy of national sovereignty. Instead, she advocates an attenuated or "chastened" version of it.

Why the insistence of national sovereignty? Because

the nation state is a phenomenon that cannot be imagined or legislated out of existence. Needing others to define ourselves, we will remain inside a state-centered discourse, for better or worse... Human beings require concrete reference groups in order to attain or secure individual identity... In order to sustain crivic life with any degree of robustness, a perceived sense of shared identity is necessary.... A world of many nations each with its own particular marks of identity, reminds us that we are not alone and that we cannot and ought not to make the world 'one' by cruelly obliterating diverse ways of life (pp. 23, 24, 28, 33).

Enunciated with such passion, this identity thesis demands careful reflection and attention to counterexamples. Consider someone who loves mathematics, undertakes mathematical research, posts results in journals and on the Internet, corresponds daily with mathematicians worldwide via email, and obtains a sense of identity in terms of this work. Does this mathematician not have an identity, and one that has nothing to do with national boundaries? Likewise the American Christian who is as concerned with non-American souls as American ones, and likewise the parent whose sense of purpose derives primarily from family life. They all require peace and order, but peace and order can be supplied by empires as well as nation-states. For all of them the nationstate is a means, not an end. Saying so is no endorsement of conformity. Diverse communities do not require diverse nations.

Why is Elahtain averse to transnational solutions? One problem is that a larger confederation cannot be checked by any of its component parts, and totalitarianism looms (p. 7). This point was urged before by the Whiskey Rebels of 1793, but the United States, despite lapses at Waco and Ruby Ridge, has thus far avoided the full collapse of liberty. A second problem is that confederations and empires do not

evoke the love and loyalty that nations do, and hence they lack the necessary spiritual glue that supplies order without force. Here perhaps a possible reply is that affective loyalty can be invested in local communities and affinity groups, and a different, self-interested loyalty can be directed to the larger entities that provide safety for the smaller.

Reason and self-interest play a small role in Elshtain's thinking and remedies. But the sense of self-interest that ended the religious wars of the seventeenth century in favor of Westphalian arrangements may prevail over the nationalist irredentisms of the late twentieth century, which cannot claim to be more passionate. Elshtain's suggested alternative escape from the cycles of passion and revenge is forgiveness, which "disrupts automatic processes and opens a space for something new to begin" (p. 41). But forgiveness is sometimes prudent, sometimes not, and reason is needed to tell us when the time is right for forgiveness.

According to Elshtain, for example, "the Japanese government has apologized to all women still alive who were forced into prostitution as 'comfort ladies' under Japanese dominion in World War II" (p. 45). But in truth there has been no official apology (only an acknowledgment of fact in 1993), and compensation has been doled out indirectly through a nongovernmental organization, so no Japanese official touches money that is received by a victim of these crimes. Forgiveness in the face of such duplicity goes against all that is reasonable.

Elshtain includes a derisive paragraph about Sir Julian Huxley, who predicted that science would prevail and religion disappear by the end of the century. Myths indeed we still have with us, and they inspire and move many to do great things. Elshtain is right to remind us of the power and virtue of myth. The problem comes, and here the line must be drawn, when myths get armies.

The Community of Rights. By Alan Gewirth. Chicago: University of Chicago Press, 1996. 396p. \$39.95 paper.

Benjamin R. Barber, Rutgers University

We live in an era of the triumph of market ideology—an era of privatization and commercialization after the "end of big government," in which no government intervention (however mild) is safe from criticism, and no market mechanism (however violent and unjust) is subject to rebuke. It is thus of more than merely scholastic interest that the distinguished philosopher Alan Gewirth has written a sequel to his classic Reason and Morality that sets out a powerful case for an active government role in securing positive economic and social rights. The Community of Rights is premised on the passionate conviction that there are "vast unfulfilled needs for freedom and well-being on the part of masses of persons in the United States and throughout the world" (pp. 356-7) that are not being addressed by conventional political rights or the conventional centrist politics that accompany them. Gewirth means to make a philosophical argument around the construct of "the community of rights" that brings into a "relation of mutual support" the seemingly antithetical notions of rights and community.

Gewirth's project engages him in a challenging defense of positive rights, a critical analysis of community and communitarianism, a discussion of welfare statism and its costs (especially dependency), and an elucidation of concrete governmental strategies for securing community and positive rights—above all economic rights. His argument unfolds as a logical exploration of the entailments of agency (at the core of rights discourse) in a world of action that reveals agency's

primal interdependence. Because, Gewirth argues, agency entails action, and action requires intentionality (purposiveness) whose end is well-being, rights holders "logically must acknowledge they have correlative duties" and recognize that their rights commit them to the proposition that "all other agents have the same rights equally" (p. 17). From this consideration comes what Gewirth calls the "Principle of Generic Consistency," which dictates that one must "act in accord with the generic rights of your recipients as well as yourself" (p. 19). That is, "the agent recognizes that other persons are similar to her in being prospective purposive agents and having the needs of agency, and on this ground she rationally accepts that they have the same positive rights she necessarily claims for herself" (p. 19). In this manner, rights and community are brought together.

Claims of this kind are not, of course, without precedent. Gewirth comes out of a long tradition, about which he is curiously mute, a tradition that can be traced from Rousseau and Hegel through T. H. Green. As did Rousseau, such thinkers know that rights "must be based on convention" (The Social Contract). Gewirth would certainly agree with Cass Sunstein and Steven Holmes, who in their new book, The Cost of Rights (1999), posit that "rights are public goods: tax-payer-funded and government managed social services designed to improve collective and individual well-being. All rights are positive rights" (Sunstein and Holmes 1999, 48).

Gewirth applies himself to rooting his argument in logical consistency (a philosophical task), but he also demonstrates how positive rights grounded in agency play out in the justification of interventionist social and economic policies by a strong government (a political task). Hence, despite its philosophical Kantian injunction to obey consistency, The Community of Rights gives a political utilitarian inflection to rights discourse: It is rooted in the value of individual agency (as are negative rights arguments), but it affirms that rights are necessarily positive and communitarian-vehicles for sustaining "more healthy and happy persons" whose needs are accommodated by the whole community, even when that means compromising or abrogating private rights to property. Autonomy cannot, Gewirth is sure, entail an absolutist defense of individualism or property, for the very existence of poverty is a "prima facie violation of human rights" (p. 108). Moreover, while Gewirth wishes to soften the opposition between freedom and common ground that characterizes the rift between liberals and communitarians, he is also clear that "the scope of economic democracy must be broadened so that it encompasses a whole national economy" (p. 298).

The power of this approach is that in ameliorating the stark dichotomies of individual and community it provides a broad justification, compatible with rights discourse, for positive governmental health, education, and welfare policies as well as for a politics of redistribution. Yet, it would underestimate the ambition of Gewirth's work to understate the problems it encounters. Some are theoretical, and some are very practical and political in nature.

On the philosophical plain, I do not find the argument from rational consistency to be persuasive. Political agents obey interests, not formal rationality or logical necessity. Kantian moral formulas that enjoin people to act as if the principles underlying their actions were to become universal may describe a moral deontology, but they do not capture political conduct in a consequentialist world of the kind to which Gewirth's utilitarianism commits him, a world inhabited by free riders, interest-mongering egoists, and their unruly cousins.

More than such theoretical questions, however, it is prac-

tical political dilemmas that are posed by Gewirth's analysis. It is not always clear that Gewirth has fully absorbed the lessons of the failures of progressive politics in America and Europe over the last half century. (I say this as a progressive.) It is not simply that as a utilitarian he seems at times a little tone deaf to the claims of individuals, as when he subordinates private property (liberty's twin) to the claims of liberty properly understood (the claims of the common good to which agency logically must be wedded). It is that he seems blind to the political and historical consequences of his rationally grounded refusal to distinguish liberty's negative imperative (Leave me alone! Laissez faire!) from its putative positive entailments (Help me! Do for me!).

However powerful the philosophical case for the commingling of the two on logical grounds, the politics of negative rights is limited government liberalism, while the politics of positive rights is a potentially limitless governmental encroachment, as with the formula "poverty is a prima facie violation of human rights." Gewirth does not back off from acknowledging the socialist consequences of his positive liberty logic, but he obviously worries about the political consequences of his socialist logic (so readily apparent in the history of socialist political experiments in the twentieth century.) The kinds of command economies mandated by social justice and the cry "eradicate poverty" have often failed to forge justice, have endangered liberty, and have sometimes made for poor economics as well. (Again, I say this as a progressive.)

Perhaps these difficulties are related to the portentous asymmetry between negative rights arguments rooted in the safe cry "Don't do that!" and positive rights arguments rooted in the alarming injunction "You must do that!" It is certainly true that "leaving people alone" to enjoy their freedom who do not possess the means to be free in the first place is a treacherous kind of hypocrisy, but it is also true that demanding from those who are free a supererogatory effort on behalf of those who are not may compromise generic rights fatally. Gewirth acknowledges as much when he offers balancing warnings about the dangers of "duty overload" and reminds welfare statists that when they take from some to empower others to acquire liberty, those who give must be in "a position to give it without comparable cost," in other words must have a "surplus."

But who measures the "comparable cost?" How are we to determine when the free have a "surplus" from which the unfree can draw to increase their own share? If the choice is discretionary—dependent upon supererogatory choice—there is no moral problem of encroachment, but there is not very much likelihood of redistribution either. If the choice is coercively imposed, it can hardly be regarded as consistent with agency and is likely to be politically tyrannical as well. Just how far-reaching the encroachment may be is evident in Gewirth's striking claim that the haves may be obligated not only to guarantee the have-nots welfare assistance or jobs but also to assure that they have creative jobs. That is to say, welfare recipients must literally be "given realistic hope that they can develop their abilities of productive agency so that they are not forced to work at the lowest levels of their competence, but instead are enabled to come as close as their latent abilities permit to the creative mode of work" (p. 131). What the costs in coercion (some might say totalitarianism) of legislating this excessively positive notion of rights might be is scarcely to be imagined (or perhaps all too readily imagined).

Greater attention to Rousseau's formula making ongoing participation in the creation of the general rules regarding

justice the condition for obedience to just community principles might have helped Gewirth soften the coercive entailments of positive rights political strategies, but he seems more interested in getting rights to secure just ends than in legitimating them through consent, participation, and political engagement, and thus protecting autonomy. He tries always to contain the contraries of individual and community in his own formulas, but at times this has more the feel of fudge than dialectic. Will workers use the "creative potential" caveat to "shirk" work? Perhaps, but shirking is "a more complex phenomenon." Should welfare mothers be constrained from bringing more children into the world? "There is merit" on both sides of the argument is his evasive reply. Even on the large issues, Gewirth displays an ambivalence camouflaged as dialectic: "In one respect," he writes, "there should be common or public ownership of the means of production," but then, thinking better of so radical a statement, he adds: "but in another respect not" (p. 196). This is not very helpful.

Perhaps Gewirth's approach to the hard questions of welfare would have been helped by greater reliance on the empirical social science research of such scholars as Bill Wilson, Frances Fox Piven, and Andrew Hacker, who take up the moral and rights questions that exercise Gewirth from a sociological perspective on welfare realities. As it is, his political good will and enthusiasm sometimes outrun his empirical political grasp, putting outcomes in front of democracy and justice before autonomy.

These criticisms are meant as a tribute to a remarkable book that more than any other in the last decade marries philosophical and political analysis and grounds the argument for governmental involvement in issues of welfare, redistribution, and social justice in a rigorously rationalist examination of the logic of rights. If it is not fully persuasive in its conclusions, this is only because Gewirth is grappling with the most intractable dilemmas of political philosophy, and in the best tradition of Rousseau, Kant, and Rawls he is attempting to give political expression to his deep sense of justice without violating the spirit of autonomous agency on which—if it is not to become that "gentle despotism of reason" favored by Enlightenment rationalists—justice must ultimately rest.

The Inclusion of the Other: Studies in Political Theory. By Jürgen Habermas. Cambridge, MA: MIT Press. 1998. 300p. \$32.00.

James Johnson, University of Rochester

This volume contains ten essays that Habermas wrote in the mid-1990s. The essays trace the connections between his claim that morality has universalistic bases and pressing political issues raised by what we might loosely call "multiculturalism." The volume thus is valuable to the extent that it renders Habermas's earlier philosophical work accessible by extending it to more topical issues of politics. Yet, because they presuppose familiarity with that earlier work (as developed in *The Theory of Communicative Action* [1985/1987] and Between Facts and Norms [1996]), the essays place a considerable burden on the reader.

The first essay goes some distance toward relieving this burden. There Habermas seeks to defend what he calls the "cognitive content of morality" by arguing that moral claims can be justified with reasons. To do so he invokes the central tenet of his theory of communicative action, namely, that reasons, depending on their subject, necessarily embody validity claims to truth, normative rightness, or sincerity. On

this basis he endeavors to identify the conditions of successful deliberation on moral, legal, or political questions. He develops his own views in ongoing contrast with a variety of philosophical alternatives and in the process inadvertently underscores the parochialism of much analytical political thought. Although Habermas discerns and explicates the central arguments of a wide array of prominent and even relatively obscure Anglo-American philosophers and political theorists, those same authors typically demonstrate scant ability or willingness to reciprocate.

The point of the opening essay is not merely to reiterate and summarize Habermas's views. Rather, it is meant to show how, even under conditions of irreducible ethical and cultural pluralism, the communicative processes in which all political agents unavoidably participate afford the conditions needed for "a nonleveling and nonappropriating inclusion of the other in his otherness" (p. 40, emphasis in original). Stated oversimply, communicative action necessarily trades on the force of validity claims that in principle can be criticized. It is this susceptibility to criticism that highlights the importance of norms of openness and reciprocity. Discourse, understood as the reflexive form of everyday communication (p. 41), thus itself defines the permanently permeable bounds of an inclusive community within which political agents might, as equals, negotiate ethical and cultural differences.

The remaining essays in the volume are distributed across four sections that address, respectively, Habermas's extended exchange with John Rawls, questions of citizenship and nationalism raised by (among other things) the reunification of Germany, the status and force of international human rights, and problems with deliberative conceptions of politics. In all these essays Habermas confronts what he takes as the unavoidable, unprecedented religious, moral, ethnic, and cultural pluralism of contemporary societies (p. 117). His aim is to offer theoretical resources that might "sharpen sensitivity to the diversity and integrity of the different forms of life coexisting within a multicultural society" (p. 225).

Habermas first contrasts his own discourse theoretic approach to this problem with the "political liberalism" that Rawls defends. He charges that in the latest development of his thought Rawls abandons the terrain of "a universally binding practical reason" and instead relies on the fortuitous "convergence of reasonable worldviews" to sustain an overlapping consensus on justice (pp. 82-3). The problem with this, as Habermas sees it, is that the parties to any overlapping consensus might, as observers, agree that they have attained such convergence, but their diverse individual ethical, religious, aesthetic, and political commitments nevertheless remain opaque to one another. Within the Rawlsian "political" conception of justice, the inhabitants of an overlapping consensus are under no pressure, as participants, to defend any "metaphysical" position that they might embrace. Each simply must ascertain whether the consensus, in fact, accommodates their own comprehensive metaphysical doctrine (p. 91). By contrast, Habermas argues that the validity claims we necessarily raise in communicative action, just insofar as they are criticizable and so demand defense, press us to justify our commitments through discourse. He thus contends that, unlike the position Rawls advances, his own discourse theoretic approach "does not bracket the pluralism of convictions and worldviews from the outset" (p. 59).

From his engagement with Rawls, Habermas proceeds to more directly practical, political issues. He first turns his attention to problems of European nationalism. He offers an historical vignette intended to establish that within European nation states citizenship has encapsulated both a legal status defined by rights established in positive law and a sense of

cultural membership. Habermas argues that these components of citizenship coexist uneasily and that our contemporary confrontation with ethnic, linguistic, and religious diversity underscores that tension. Habermas notes that a common response to this tension is to treat cultural membership as "the prepolitical fact of a quasi-natural people" (pp. 115, 219), and he reminds us that recent experience affords numerous examples of the dangers that attend any such interpretation. In the face of such dangers he rightly thinks it imperative that the rights of citizens be disentangled from any claim to membership in a homogeneous, prepolitical group. He advocates a discursively grounded "constitutional patriotism" in which members of each nation state elaborate 'a distinctive interpretation of those constitutional principles that are equally embodied in other republican constitutions—such as popular sovereignty and human rights—in light of its own national history" (pp. 118, 225). He suggests that a minimal core of any such accommodation very likely will be solid recognition of social and cultural rights in addition to less controversial liberal rights of individuals.

This last claim raises the question of whether the sorts of collective security and identity that such measures are meant to provide can "be reconciled with a theory of rights that is individualistically designed" (p. 204). Habermas insists that only an unsupportable "selective reading of the theory of rights" (p. 210) can sustain the view that collective rights to economic security or cultural identity are fundamentally incompatible with the traditional liberal preoccupation with individual rights. His claim is based on the observation that the autonomy of individuals to whom we ascribe rights itself necessarily trades upon intersubjectively recognized collective identities (pp. 207–8, 221). And these identities, in turn, must be understood (as above) not as prepolitical social facts but as the product of discursive political interpretation and deliberation.

We thus readily can see why Habermas aims to make a "proceduralist conception of deliberative politics the cornerstone of the theory of democracy" (p. 246). It is only under procedures that insure inclusive, free, and equal participation that collective identities, political traditions, or legal enactments might be justified to diverse populations who inhabit contemporary polities. It is crucial to recognize this, according to Habermas, if we hope to specify a conception of democratic institutions that might simultaneously include now marginal constituencies without absorbing them into a culturally homogeneous polity (p. 139). And that, he rightly insists, precisely is the challenge that confronts those who pursue democratic politics in multicultural societies.

Reconstituting Social Criticism: Political Morality in an Age of Scepticism. Edited by Iain MacKenzie and Shane O'Neill. New York: St. Martin's, 1999. 217p. \$65.00.

Wayne Gabardi, Idaho State University

The eleven essays in this volume are the product of a conference held in June 1996 at Queen's University, Belfast. As the title indicates, the theme was the current status (O'Neill refers to it as "the contemporary crisis," p. 1) of philosophically grounded social criticism in a time of postsocialism, neoliberal globalization, and postmodern skepticism. As O'Neill makes clear in the Introduction, the Left must regain its theoretical self-confidence and advance a powerful, alternative progressive vision to the present order of things.

O'Neill's introductory essay does a good job of defining the challenges facing contemporary critical theorists and summarizing the work of the eleven contributors. The essays are

lucid, topical, significant, and short. All these qualities are virtues. The essays also offer a rich variety of alternative theoretical strategies for advancing progressive social and political critique. They strive to clarify and modify the work of Marx, Walzer, Foucault, Castoriadis, Rorty, Habermas, and Rawls, among others.

This book is divided into four sections. The essays by Simon Caney, Keith Graham, and John Baker advance arguments in defense of moral universalism as a normative foundation for social and political critique. Those by Aletta J. Norval, Jon Simons, and Caroline Williams reaffirm the validity of contextual critique and the poststructuralist contesting of boundaries. The contribution by Nicholas H. Smith sorts out the positions of Richard Rorty and Jürgen Habermas. Norman Geras revisits the Holocaust in order to illuminate that "a contract of mutual indifference is a reality in the contemporary world" (pp. 10-1). The concluding essays, by Richard Bellamy, Maeve Cooke, and Thomas McCarthy, deal with the task of negotiating normative critique in a time of cultural pluralism from the respective perspectives of liberalism, deliberative democracy, and neo-Kantian conceptions of cosmopolitan justice. The essays by Norval, Simons, Smith, Cooke, and McCarthy speak most directly and significantly to the book's stated challenge of reconstituting philosophically grounded social criticism at the present time.

Norval draws upon Derrida's thesis of "iterability" to bolster Walzer's account of thick and thin moralities. Walzer has argued that morality is thick (deeply embedded in history and culture) and thus critique must be immanent and interpretive, but local critique can become global through an existential or crisis encounter in which a thin, universal morality emerges out of the experiential interchange of cultures. The problem, however, is that Walzer conceptualizes cultures, and therefore moralities, as bounded, intact, univocal voices (a closed "we"). Derrida's thesis of the repetitive alteration of a constructed identity or sign allows us both easier movement between thick and thin narratives and a greater appreciation of the complexity of situated and reconstituted critique.

Simons employs Fredric Jameson's idea of aesthetic "cognitive mapping," Foucault's critical genealogies, and the work of Virginia Woolf to make the case for "fictive theory." Unlike critical theory, which is committed to epistemological foundationalism and emancipatory social scientific knowledge, fictive theory employs aesthetic cognition in developing critical narratives and images that can contest existing power networks. Simons makes a compelling argument that an aesthetic politics is often more effective and resonates better with its interpretive audience or community of action than does critical theory's appeal to epistemological rigor and "the force of the better argument." I agree. In a postmodernized world, the pragmatic power of fictive representations and symbolic politics allows us more scope for effective action.

Smith tackles the attempts made by Rorty and Habermas to advance new modes of critique while acknowledging contingency. In the case of Rorty, the human condition is structured by radical contingency. In the case of Habermas, the formal structures of speech and moral claims about justice or "right" transcend contingency. Smith's insightful exposition and critique of both positions leads him in a thought-provoking direction. Smith reminds us, and Rorty, that a commitment to radical contingency in all things can undermine both the pursuit of self-creation and social solidarity. As for Habermas, his "postmetaphysical" model of procedural-discursive reason results in both a too narrow and too demanding idea of a philosophically constituted social

criticism. By contrast, Smith opts for a greater appreciation of "ontological reflection" linked to substantive ethical orientations. Although Smith does not develop this approach, significant work has been done in this area by Fred Dallmayr.

Contending that ethical conflicts are reconcilable in principle, Maeve Cooke makes the case for a modified version of Habermas's model of deliberative democracy. Cooke believes that substantive ethical values can be given more weight in relation to procedures of moral justification and that the regulative ideal of rational consensus needs more slack. Despite its weaknesses, Habermas's model of democracy is better than those advanced by postmodernists because the latter lead us in the direction of a privatization of ethical matters. On this point I find Cooke unconvincing. As I read William Connolly and Chantal Mouffe, their postmodern models of radical democracy do not, in principle, result in an ethos and politics of privatization.

McCarthy, convinced that the time is ripe for rethinking cosmopolitan ideals, turns to the theories of justice advanced by Rawls and Habermas to illuminate this conviction. Rawls's recent attempt to develop a theory of international justice in "The Law of Peoples" (Critical Inquiry 20 [Autumn 1993]: 36-69) is a disappointment for McCarthy. In order to accommodate "well-ordered, non-liberal societies," Rawls's liberal ideas of justice and "reasonableness" undergo "considerable dilution" (p. 197). McCarthy concludes that Rawls jettisons distributive and democratic concerns and reduces civil liberties to a bare minimum in order to make justice acceptable to nonliberal societies. The result is cosmopolitan but not very just. McCarthy concludes with a very brief sketch of "an alternative route" (p. 207) closer to the spirit of Kant and Habermas and designed to accommodate both multicultural cosmopolitanism and a legal-political structure of human rights and global federalism. If one is searching for a much more sophisticated neo-Kantian account of cosmopolitan justice, however, I would recommend David Held's model of cosmopolitan democracy in Democracy and the Global Order (1995).

One section is missing in this fine collection of essays. This would map out the existing power structure to which all these critical theories and alternative models of criticism are opposed. Not one essay seeks to give us an idea of what our current postsocialist, neoliberal, globalized condition looks like. Should not this be our starting point in the development of critical theories and progressive political agendas?

Capitalism, Democracy, and Ralph's Pretty Good Grocery. By John Mueller. Princeton, NJ: Princeton University Press, 1999. 335p. \$29.95.

Paul Cammack, University of Manchester

Mueller wants us to ask less of democracy than some of its keener advocates have promised; to value capitalism, particularly as a moralizing force, more highly than it has generally been valued; and overall to accept that the two together provide pretty much all we might need. When the two coincide, we are in Ralph's pretty good grocery, Garrison Keillor's fictitious Lake Wobegon store, where, if you cannot get it, you can probably get along without it. After a brief description of the contrasting "image mismatches" to which capitalism and democracy are subject—capitalism having an unjust negative image, and democracy an unrealistic positive one—four chapters advance the case for capitalism as a force for virtue, and three warn of the dangers of expecting too much of democracy. The book then concludes with a brief discussion of connections and disconnections between the

two and an inventory of seventy-six propositions that helpfully restate the argument. Mueller makes his case in a deceptively folksy style, but at the same time he is explicit about his purpose of creating an enabling myth for capitalism, and he is ruthless in pursuing it. If he is not entirely successful, it is because of the glaring contrast between his treatment of capitalism, on the one hand, and democracy, on the other, a fundamental ambiguity in the case made for capitalism; and a range of reference so narrow and selective that reasoned argument continually gives way to crass boosterism and caricature.

At the close of his brief discussion of the sources of capitalism's negative image (chap. 2), Mueller recalls Paul Samuelson's description of capitalism as an "efficient but unlovable system with no mystique to protect it" (p. 68), and he laments the fact that the virtues of capitalism—honesty, integrity, compassion, and civility (elsewhere supplemented by fairness and heroism)—are rarely stressed by "propagandists for the system as a whole" (p. 69). These passages give the game away. Mueller is out not to present a balanced analysis of capitalism but, rather, to create a noble mystique to support it. He does so first by proposing that honesty pays in business, and all that is needed is for one or two entrepreneurs to realize this and act upon it in order for the rest to learn and prosper. His pioneering heroes, who make early and repeated appearances in the text, are P. T. Barnum, the nineteenth-century showman, and John Wanamaker, the nineteenth-century retailer; their virtue consists in giving customers a square deal. Leaping to the late twentieth century, Mueller claims that governments now understand how to make capitalism work by promoting free trade, leaving wages and prices to find their own level, abandoning enterprises that can be handled by the private sector and allowing those that cannot compete to fail, keeping regulation to a minimum and taxes low, and accepting a considerable amount of economic inequality (pp. 114-22). In these circumstances capitalism can flourish if only people will learn to love it. Mueller's contribution is to create folk heroes from the past to provide a supporting mystique for capitalism in the present.

This beguiling construction is undermined, however, in two ways. First, Mueller equivocates, arguing that "capitalist morality," being nothing more than hard-headed business sense, is not strictly speaking morality at all but calculation, and he escapes with the lame proposition that it is nevertheless only convincing when sincerely espoused. Second, he backtracks, arguing at times not that capitalism's virtues are bound to assert themselves but that they would assert themselves if only capitalists could see their utility. This strengthens the case for propaganda but only by weakening the supposed causal mechanism that necessarily generalizes the virtues of capitalism in the first place.

In stark contrast to this romanticized and idealized depiction of capitalism, the chapters on democracy take a diametrically opposed approach. Mueller attacks the image of participation and equality, captured in a Norman Rockwell painting of a working man putting forth his point of view in a New England town meeting, as a "misty-eyed, idealized snapshot" with "almost nothing to do with democracy in actual practice" (p. 137). He mercilessly debunks "democratic myth-builders" who have "chosen to emphasize the occasional political success of upstarts raised in log cabins" (p. 150), and he dismisses democracy's supposed virtues in favor of the proposition that it is "essentially a governmental gimmick" that has succeeded as a result of astute marketing (p. 203). Mueller then argues that democracy is a system in which apathy is to be applauded and in which the play of

special interests in petition and lobbying, in which those with greater material resources necessarily win out, is the "whole point" (pp. 153, 171–85). These are familiar themes in empirical democratic theory, but even so Mueller is unceremonious in the extreme, questioning the need for elections and scorning Dahl and others for suggesting that new mechanisms should be devised to enhance popular participation.

In sum, Mueller is out to puncture a myth associated with democracy and to inflate another associated with capitalism. The more or less conscious purpose of the whole proceeding is to make capitalism the direct source of virtue and reduce democracy to what contemporary capitalism can bear. For my money, the effort is too transparent and too contradictory to convince. In any case, Mueller himself has to concede at the close that his version of democracy and capitalism may lack an answer to the great philosophical themes of truth, the good, and the meaning of life (p. 240). He responds, with Voltaire's Candide, by shrugging and proposing to cultivate the garden. Were he to venture into it, he might meet an individual who does not figure in the text but who hovers over it throughout—the unlucky Dr. Pangloss, whose perpetual response to the horrors of the world was the dogged insistence that everything in it was ordained for the best.

Barbarism and Religion, Vol. 1: The Enlightenment of Edward Gibbon, 1737-1764. By J. G. A. Pocock. Cambridge: Cambridge University Press, 1999. 323p. \$49.95.
Barbarism and Religion, Vol. 2: Narratives of Civil Government. By J. G. A. Pocock. Cambridge: Cambridge University Press, 1999. 413p. \$49.95. Two-volume set \$90.00.

Robert Booth Fowler, University of Wisconsin-Madison

These two substantial volumes are part of J. G. A. Pocock's projected multivolume exploration of the thought of Edward Gibbon (1737–94), the still controversial author of the even longer Decline and Fall of the Roman Empire (1776–88). Pocock devotes so much effort to Gibbon because he believes Gibbon was a "very great figure" (Vol. 2, 402), although exactly why he makes this judgment is not especially clear in this study.

In volume 1, Pocock endeavors to situate Gibbon in terms of his intellectual journeys—both geographic and mental—during his younger years. This is absolutely essential for Pocock's entire project, since he believes that Gibbon and his work cannot be understood unless they are explained contextually. Pocock succeeds splendidly in this effort, constructing a picture of the worlds of the young Edward Gibbon of considerable nuance and texture.

Less interesting is his other objective in volume 1 (and volume 2 as well), his determination to show that there were several Enlightenments, not just one. Pocock makes this case skillfully, as always, but this claim is now so widely shared that it is not obvious why it is worth his while to make it.

In volume 2 Pocock undertakes to set the Enlightenment intellectual scene for *The Decline and Fall of the Roman Empire*. He does so by exploring in characteristic depth other historians in the Enlightenment. The result of this effort is a marvelous, remarkable achievement. In the masterful manner we know to expect from Pocock, one which reflects the "complexity" (Pocock's favorite word) of his subjects, Pocock considers the major Enlightenment historians who were contemporaries of Gibbon. Some, such as David Hume and Adam Furguson or Voltaire and D'Almbert are common

currency in Enlightenment studies; others, such as Pietro Giannone or Freret, are much less so. In each case, though, Pocock provides a similar serious treatment, usually several chapters long. His discussions are models of judicious presentation of the historian's work and thoughtful analysis of his ideas and historical context.

Along the way, Pocock expresses gentle admiration for these (and other) Enlightenment historians, however they proceed. He consistently shows an understanding and respect for other scholars, past and present, that is generous and never detracts from his commitment to serious analysis and reflective judgement.

Pocock's volumes are least warm to Voltaire and his histories. In part, this is because Pocock's narrative of Gibbon involves the story of Gibbon's rejection of Voltaire's method of historical study. But it is not only Gibbon who is critical of Voltaire. Pocock obviously shares Gibbon's negative conclusion. Gibbon rejects Voltaire's history as "superficial" (Vol. 1, 153), flashy and unsubtle, too committed to history as a species of grand philosophy, reflecting Voltaire's too easy radical skepticism (about most anything or everything), and Pocock evidently agrees.

In these volumes, Gibbon emerges as someone who over time learned the demanding craft of writing history, in a manner that turns out to be close to that which Pocock most respects. Thus, these two magnificent volumes are not, one soon appreciates, just about Gibbon and his intellectual context or the historiography of the Enlightenment historians. These tasks are central for Pocock, and they are wonderfully achieved. But in Barbarism and Religion Pocock has also written a major treatise on historical method, especially regarding the history of ideas. Granted, Pocock honors his well-known avoidance of ideologically driven and presentist scholarship in this work. But he hardly hides his affection for Gibbon's project, because he and Gibbon share much in common in their methodology.

This methodology focuses, above all, on erudition, which for Pocock seems to mean a deep and serious scholarly engagement with authors' works and with their intellectual and cultural contexts. It also involves commitment to accurate and lively narrative history as well as a degree of overall philosophical exploration and unity. It always includes a profound appreciation for complexity and irony in history. For example, Pocock makes a major point of insisting that the involvement of the Anglican Church in the English Enlightenment involved a complexity both in terms of conflicts within the Church of England and with the larger state and society that simply cannot be grasped neatly as too many Enlightenment discussions try to do. And he lauds Gibbon because he loved the ironies of history and of his own history while he wisely rejected "following philosophy at the expense of facts" (Vol. 2, 157). For example, Gibbon perceived the irony revealed by close study of early popes that they were often friends as well as enemies of human freedom (Vol. 2, 71).

As yet another example of Pocock's laudable scholarly studies, the two volumes of Barbarism and Religion offer the author's fellow scholars a great deal: a study of Gibbon in his intellectual and personal contexts, a splendid discussion of historians in the Enlightenment, and a pointed discourse on method in history. While this work is hardly for the general reader, Barbarism and Religion is a reassuring reminder that serious historical scholarship continues to appear and inform us. And it is yet more evidence that J. G. A. Pocock is a master of this increasingly precious art.

Equality, Responsibility, and the Law. By Arthur Ripstein. New York: Cambridge University Press, 1999. 319p. \$54.95.

Mark A. Graber, University of Maryland

Legal systems are concerned both with standards of responsibility and with allocating the consequences of luck. Whether a person is held liable in tort for dropping a hammer depends partly on whether the person should be blamed for dropping the hammer and partly on whether the hammer fell harmlessly to the ground or hit another person. Sometimes persons who shot at what they believed was a deer and hit a human being are punished as severely as persons who shot at what they believed was a human being and hit a deer. Distributive justice presents similar mixed questions of responsibility and luck. Americans debate both what constitutes "unearned" income and whether such income should be taxed more than earned income.

Arthur Ripstein has written an important work on the interaction among responsibility, luck, and justice. His study details and largely defends the circumstances under which present Anglo-American law holds persons hostage to fortune. Equality, Responsibility, and the Law maintains that the law uses, and should use, objective reasonableness standards in those instances "where luck has a role to play-accidents, mistakes, emergencies and attempts" (p. 6). "Rather than asking everyone to expend the same degree of effort," Ripstein insists that "the law demands the same degree of care from everyone and protects all to the same degree" (p. 86). Criminal liability does not depend on whether I shot at what I thought was a deer or even if I did my best to ensure that my target was a deer, but on whether a reasonable person would have thought the target a deer. Reasonableness standards similarly determine tort liability and the resources necessary to live a responsible life.

This objective reasonableness standard is necessary to preserve the "fair terms of interaction" (p. 105). Subjective tests are unfair because they make the rights of persons depend on the particular capacities of other persons. Whether A consents to a trade would depend entirely on whether B thought A consented. This unfairly makes "one person's security depend on another's state of mind" (p. 105). Similarly, the law should not obligate persons to perform easy rescues because such a rule "would make the security of those in peril depend on considerations about the welfare of those positioned to rescue them" (p. 92). Rather, Equality powerfully argues that the law treats people as equals only when "the line between the choices for which a person may be held responsible, and circumstances for which he may not, is set objectively" (p. 266). Persons are negligent when they fail to take reasonable precautions against injuring others. Persons are excused from crime when a reasonable person would have made the same factual mistake. Ripstein does go too far when he claims that "the criminal law serves primarily to protect and vindicate fair terms of interaction" (p. 134). Most societies punish some "victimless" crimes. Most people do not think the main fault with murder is that victims are deprived of the right to choose suicide.

Equality will serve as an excellent guide to the issues of responsibility central to much tort and criminal law. Ripstein has mastered the law and scholarship on these subjects, writes clearly, and offers intelligent solutions to important legal problems. Still, his arguments are hardly airtight. Objective standards are no more equal in the abstract than subjective standards. Some difference theorists maintain that persons are treated equally only when they are treated differently. This view may be wrong, but it is never discussed

in the book. Moreover, contrary to Ripstein's claims, one person's security always depends on the mental state of other persons. All we can do is our best. Telling us that we will be held liable in tort or criminally punished if our best does not meet a reasonableness standard is not particularly helpful in the absence of any specific public understanding of what acts are reasonable. Equality rarely discusses what acts are reasonable, or whose rationality a reasonableness standard at different times and in different places is likely to privilege.

Ripstein does do a nice job of demonstrating the close connections in the way tort law, criminal law, and distributive justice understand the relationship between luck and responsibility. His study demonstrates that what may seem obscure questions of common law raise fundamental issues of justice. In particular, Equality recognizes that legal liability is only meaningful when principles of distributive justice are satisfled. "If someone's opportunities are severely limited . . . by poverty or ill health," Ripstein declares, "it is unfair to hold him responsible for the costs of his choices" (p. 272). The chapter on distributive justice then provides an interesting exploration of the nature of the social safety net. The book does not, however, examine at length the extent to which persons who start with scarce holdings are excused from legal liability. Readers do not learn whether the desperately poor may steal a loaf of bread or the desperately ill may illegally use marijuana to ease their pain.

Equality, Responsibility, and the Law will interest more academic lawyers and philosophers than political theorists and political scientists. This is a fair description of the book the author wrote, not a complaint that a professor of philosophy and law should have written a different book. The main body of the work is devoted to an analysis of specific problems of tort and criminal law. Only the last two chapters discuss those broader issues of social organization that concern students of politics. The literature discussed and critiqued is largely legal and philosophical. Distinctively political science perspectives on tort and crime are not considered. Ripstein does recognize that problems of implementation are central to a just society, but he asserts that these issues are not his present concern. Thus, readers will not find out how objective a reasonableness standard enforced by juries is likely to be. The redistribution schemes necessary to ensure the fair terms of interaction are also beyond the scope of Equality. For these and numerous other reasons, the book is not likely to be assigned in many undergraduate or graduate political science courses. Still, good books do not have to be good political science books, and political scientists who read nothing but political science are likely to have little to say to the vast majority of persons who are not political scientists. Scholars interested in "a principled account of where the results of luck properly lie" (p. 2) will find Equality, Responsibility, and the Law an interesting, provocative read.

The Problem of Trust. By Adam B. Seligman. Princeton, NJ: Princeton University Press, 1997. 231p. \$29.95.

Steven M. DeLue, Miami University Ohio

As Adam Seligman points out, recent discussions of civil society in the work of Robert Putnam and Francis Fukuyama emphasize trust and civic engagement as critical to securing both economic flourishing and regard for individual agency. The basis for trust here is the existence of social roles, the norms attached to them, and the confidence that individuals will conform to each of these norms. But for Seligman, since the spaces in which individuals often live extend beyond the

reach of particular roles and the norms attached to them, trust is more enigmatic for civil society thinking than is portrayed in recent thought on this subject.

Following Durkheim, Seligman accepts the view that in a highly complex division of labor each individual is a particular agent who makes her own choices about the best way to navigate her life through role diffusion. But how is social stability maintained when individuals have the freedom and indeed the obligation to choose their own life plans in the midst of such role-complex differentiation? Others, as they look at me overriding the restraints and boundaries of various social roles during the course of the pursuit of my own agenda, may conclude that I have no commitment to limit my freedom in deference to their own. When this mentality is multiplied throughout society, the bonds of social cohesion are challenged.

Durkheim's approach to sustaining social stability was grounded in the view that the shared values attached to social roles restrict conduct to clear boundaries. These norms provide the basis for having "confidence," as Seligman uses the term, that others will live within expected restraints as they exercise their freedom. As people manifest confidence in one another's role compliance, stability throughout society is secured. But for Seligman, Durkheim fails to address how in a role-diffuse world autonomous agents seeking to cement their own identities upon their own choices cope with the risks associated with the exercise of their freedom. If I want to be a lawyer, musician, and family man, then I have to make decisions about how to marshal my capacities. But in trying to excel in so many different roles, I realize that I am vulnerable to those who demand conformity to this or that role. Indeed, my risks are many. I may lose my job as a lawyer, be ridiculed for my music, or be labeled a bad father by my children.

What sustains me throughout this endeavor is the trust I have in those who support my decisional autonomy and whose help allows me to make the best use possible of my various capacities as I negotiate my life across different roles. The kind of trust that serves this end is only found in the private sphere. The relationship most fundamental to securing freedom in the private sphere for Seligman is friendship, which evolves from trust among people who care enough for one another to make decisional autonomy possible. The location of the private sphere is found in the interstices existing between our diffuse roles. In these spaces we are free to build, outside the administration of role regimens, friendships with others, and through these friendships we are empowered to make our own judgments about the best course for ourselves in a role-diffuse world.

Civil society from Seligman's point of view is predicated since the Scottish Enlightenment tradition on those characteristics of personal integrity that secure trust. Seligman expertly outlines this tradition and demonstrates the way in which it helps shore up the private space that makes possible freedom without undermining trust or spawning social instability. Seligman's chapter demarcating the civic tradition from the civil society tradition succeeds in demonstrating the reasons for the demise of the former in deference to the latter. The civic tradition of Rousseau, for instance, turns individuals into citizens who subordinate their private yearnings to the society's collective, shared values. But for Seligman, the civic tradition cannot survive in a role-complex world in which, as a result of role differentiation, different and competing values become the norm, pushing shared values to the background. Civil society houses a private realm in which people maintain sufficient trust to permit individuals the freedom to negotiate their diverse roles in life, without cost to freedom or to the bonds needed for social stability.

Still, trust is fragile in the modern world. Why is this the case? In Seligman's account, social stability is threatened when role diffusion undermines shared core values. Trust is viewed as the alternative glue that holds together a society destabilized by the loss of common shared values. But, ironically, trust rests on shared core values, too, and once these values are undermined, so is trust. Seligman says that where forms of social solidarity based on shared values are no longer possible, "the individual as [the] basis of personal identity may disappear. In this disappearance the preconditions for trust do themselves disappear as well" (p. 172).

Seligman's argument would have been strengthened if he had addressed the irony of his own account of trust within a civil society setting. If trust can survive only in the presence of certain core values, what in fact is the nature of these values? Will those connected to the Scottish Enlightenment tradition, such as sympathy, do? Moreover, what is the role of the public realm in securing the bases for trust? The public realm often functions in Seligman's account to repair the damage to society from the loss of trust. The public realm provides necessary cohesive ties through bureaucratic programs designed to achieve full equality, often at the cost of the freedom needed to establish individual identity. To compensate for this loss, people substitute for trust an alternative cohesive force—group identities based on such characteristics as race, gender, and sexual orientation. Here, a particular group identity is given priority over the quest for individual agency protected by civil society.

None of what I have written is meant to detract from the contribution of this book to civil society thinking. Through a richly textured synthesis of major sociological and political theorists, Seligman demonstrates why trust is an issue for the modern person who finds herself negotiating an ever more differentiated and complex set of roles. Seligman's discussions contrasting faith and trust as well as his treatment of the evolution of conscience and the construction of the private sphere within Christian thinking are especially important contributions. Those who wish a treatment of civil society that incorporates trust would do well to read this book.

Sovereign Grace: The Place and Significance of Christian Freedom in John Calvin's Political Thought. By William R. Stevenson, Jr. New York: Oxford University Press, 1999. 200p. \$49.45.

H. M. Höpfl, Lancaster University

The main value of this book is that it is a "whole gospel" account of Calvin. Stevenson writes as a disciple and an exegete of Calvin from within the authentic Calvinist tradition. His work is therefore a valuable corrective to the usual accounts of Calvin written from the outside (so to speak), to say nothing of interpretations based exclusively on reach-medowns, procrustean generalizations, periodizations, ideal typifications, and all the rest. Stevenson's exegesis is neither apologia nor historical interpretation but simply the exposition, largely within Calvin's own vocabulary and horizon, of the coherence of Calvin's thought. Stevenson's tentative attempts to "sell" Calvin to a modern public do not try to modernize him or even to extenuate some of his more repellent doctrines (notably "double predestination" or the intolerant aspects of the Calvinist polity). Stevenson merely explains why to Calvin such doctrines connoted no arbitrariness or injustice on the part of God. For him, the truth and scriptural authenticity of Calvin's faith are entirely unproblematic: The Christianity of sacraments, contemplation, tradition, and the Church's magisterium only appear in terms of the construction placed on it by Calvin if at all. Stevenson is not fazed by the objections in terms of the psychological precariousness of faith understood as the believer's sense of certitude, confidence, and trust, a difficulty first raised long before Weber by sixteenth-century Catholic critics. He acknowledges freely that the Christian will look for external signs of his salvation, and he restates without equivocation the Calvinist notion that the providence of God is to be discerned by scrutinizing the course of events in this world.

Stevenson is, of course, not a know-nothing fundamentalist. On the contrary, he imperturbably and generously acknowledges everything modern scholarship since Weber has offered; the only acerbity is toward Voegelin and Walzer, whom Stevenson suspects of not having read Calvin; if anything, he takes too much notice of other scholars, with tortuous diversions via expositions of their contributions before he returns to his own. In other respects, the book is reader-friendly, providing prolegomena and summaries all along the way.

Stevenson's thesis is that Christian freedom is the (or a) buckle that joins Calvin's theology and his political thought, and it reconciles apparently contradictory tendencies in his thought and one-sided interpretations based on them. Stevenson does not claim that the doctrine is the center of Calvin's theology, only that it is a more significant and integral component than is generally appreciated. He also makes some more general claims for the doctrine, especially that it reveals the superficiality and shallowness of modern individualistic, communal, and historical-developmental conceptions of freedom. But he admits that he has demonstrated nothing of the kind (p. 151), and his postulate of perennial questions to which Calvin is all or part of the answer could only convince the Calvinist faithful. The substance of his argument about the place of Christian freedom in Calvin's thought seems to me ultimately unconvincing for precisely the reason Stevenson cites for regarding it as central: Namely, that unlike his political theory, ecclesiology, or the doctrine of predestination, Calvin never reconsidered, elaborated, or amended the formulation he gave it in the first (1536) edition of the Institution of the Christian Religion; in other words, he felt that there was no more to be said about it. Nevertheless, Stevenson convinces at least this reader that much of Calvin's political thought as well as his theology can be summarized in terms of what he says about Christian freedom, and that his discussion of it was not merely a matter of finding a way of accommodating an uncongenial item in the reformational inheritance which he could not jettison, coupled with an attempt to neutralize its anarchic potential.

On Stevenson's more nuanciated reading, Calvin's Christian freedom is freedom from punishment and from subjection

tion to human institutions, for obedience and willing service, in world-transforming corporate action, without subjection to indifferent things, adiaphora, such as local custom, tradition, ceremonies (described here anachronistically as "the tutelage of history"). Given this understanding of the situation of the redeemed Christian, it can be seen how faith (entirely unmerited certitude of salvation by "sovereign grace") will generate a certain individualism (in some respects resembling liberal individualism), activism, possibly revolutionary activism, and certainly a distanciated attitude to cultural artefacts and other time-bound things, such as custom, tradition, and established authority. This terminology is indiscriminate, and Stevenson's repeated recourse to the methodologically infelicitious concepts of "contribution" and "anticipation" leave uncertain what relationship he means to assert between Calvin and later thinkers and currents of thought: Sometimes it seems to be some idea of "influence" of the former, as when he implausibly speaks of the "Calvinist roots" of "modern activism" (p. 103).

But Stevenson is clear enough about the distance between Calvinian "individualism" and "activism" and its later analogues (e.g., pp. 56, 63); and although he does not reject the concept of revolution as anachronistic for the sixteenth century, he is properly skeptical about the term's appropriateness to Calvin. What he is concerned to stress is that these moments in Calvin's thought and teaching are held in check by other moments, notably the recognition of the individual's dependence on God, the duty of love and consideration for weaker brethren (a concept not explained here) and a signal illustration of his providence, and the collective character of Calvinist endeavors: building up the Church is not a private enterprise. Thus, the "authoritarian" Calvin and Calvin the ancestor of the liberal individualists, of constitutionalism, and of resistance to tyranny are equally authentic, but the tension between them is inherent in the biblically gounded notion of sovereign grace and is one that Calvin deliberately stressed and cultivated.

The weaknesses of this work are mostly the obverse of its strengths. The interpretation considers almost no context for Calvin apart from Scripture, and its *genuinus sensus* of which Calvin is the authoritative expositor at that. The contrast Stevenson draws between Calvin and Luther's understanding of the Law (pp. 45–6) is unsatisfactory, and Calvin's relationship with Luther and other reformers is not explored. Stevenson also does not consider whether it is plausible to present Calvin's reflections about the secular commonwealth as solely inferences from scriptural Christianity, moderated by pastoral concerns. But alternative interpretations are available in plenty elsewhere (and may be found in his excellent bibliography).

American Politics

Shaping and Signaling Presidential Policy: The National Security Decision Making of Eisenhower and Kennedy. By Meena Bose. College Station: Texas A&M University Press, 1998. 197p. \$29.95.

Kevin V. Mulcahy, Louisiana State University

The reputations of Eisenhower and Kennedy have, at least in professional circles, undergone an amazing transformation. The former was dismissed (incorrectly) as a disengaged manager and uninformed figurehead, and the latter was often

lauded in journalistic circles as the modern model of a president: a personally engaged and highly interventionist chief executive. The last two decades have witnessed a rehabilitation of Eisenhower's reputation for presidential leadership. This process was aided by a good biographer in Stephen Ambrose and by Fred Greenstein's The Hidden Hand Presidency (1982), which argued the case for a more nuanced assessment of Eisenhower's public persona and decision-making processes. As might be expected from a study that began as a doctoral dissertation under Greenstein's direction, Meena Bose's Shaping and Signaling Presidential Policy makes a significant contribution to our

understanding of the policymaking process in the 1950s and 1960s.

Five aspects of Bose's work are noteworthy. First, it is well grounded in the archival sources, which (as the author observes) can be daunting to navigate. Second, Bose has interviewed several of the surviving members of the Eisenhower and Kennedy national security apparatus. Third, the study is well organized and clearly written. Fourth, its explicitly comparative approach allows for broader generalizations than is usual with case studies. Fifth, the analysis is grounded in the theoretical literature on presidential decision making, particularly on Alexander George's concept of "multiple advocacy," with the national security adviser as "custodian-manager" of a process of formalized disputation.

Essentially, Eisenhower and Kennedy represent two competing concepts of national security policy and two contrasting processes for its formation. The "New Look" defense budget promulgated by the Eisenhower administration was designed to minimize excessive military spending through adherence to a strategic doctrine that relied heavily on nuclear deterrence. Sometimes described as the "biggest bang for the buck" policy, the New Look was meant to provide a nuclear umbrella that would contain any Soviet expansionism during a long-term Cold War without an economically debilitating level of military spending. Long a critic of the Eisenhower administration's defense policy, Kennedy argued that "we have been driving ourselves into a corner where the only choice is all or nothing at all, world devastation or submission" (p. 49). Accordingly, he called for a buildup of conventional as well as nuclear forces. According to Robert McNamara, Kennedy firmly believed that the United States needed a "flexible response, a response tailored to the specific level of political or military aggression" (p. 53).

Eisenhower and Kennedy also differed sharply in their processes for national security decision making. The so-called policy hill constructed in the Eisenhower administration comprised a planning board to debate alternatives for eventual determination by the National Security Council and the Operations Coordinating Board, to monitor policy implementation. Often derided as excessively "formalistic," this decision-making process was designed by Eisenhower "to bring a wide range of policy options to his attention" (p. 99). Yet, just as "formalistic" does not accurately describe Eisenhower's decisional process, "collegial" is for Bose an imperfect description of Kennedy's management style. "At least in 1961, those processes were so fluid that Kennedy really did not represent the hub of an informally coordinated advisory network" (p. 100). For Bose, Kennedy's informal leadership style is highly problematic. "While formal processes are not problem-free, they pose less risk of resulting in policy failures, as the president does not make decisions before thoroughly examining policy alternatives with his associates" (p. 102).

Overall, Bose argues convincingly for the importance of structured decision making and institutionalized multiple advocacy; accordingly, Eisenhower's policymaking process is more favorably evaluated. Yet, there is a less convincing case to be made for Eisenhower's communication of policy. Despite Bose's strenuous efforts to characterize Eisenhower's rhetorical strategy favorably, one remembers more his Secretary of State, John Foster Dulles, calling for the "rollback" of Communism, advocating "brinkmanship," threatening "massive retaliation," and fulminating against "godless, atheistic Communism." It is difficult to see any "hidden-hand leadership" here. Of course, Kennedy's rhetoric can be judged far more portentous, "hinting that even the best

efforts of the United States might not enable it to survive" (p. 70). In sum, the second part of this work lacks the persuasive argument of the first, on which Bose demonstrates much firmer footing.

Surprisingly, there are some lacunae in this study. For example, there is no mention of Dillon Anderson, who along with Robert Cutler was Eisenhower's other national security advisor. Furthermore, although the book version of the Jackson Sub-committee report is cited, there is no discussion of the hearings themselves. Yet, these multivolume hearings were the most extensive, contemporary critique of the national security policymaking process. Furthermore, the important work of Alexander George is much in evidence, but there is little discussion of other classic analyses of the national security process, such as Keith Clark and Laurence Legere, The President and the Management of National Security (1969); Anna Kasten Nelson in Hugh Heclo and Lester Salamon, The Illusion of Presidential Government (1981); and I. M. Destler, Leslie Geld, and Anthony Lake, Our Own Worst Enemy: The Unmaking of American Foreign Policy

One also would have wished a more developed model for analyzing the different roles played by national security advisors, as attempted in Cecil V. Crabb and Kevin V. Mulcahy, American National Security (1987). "Coordinators" like Robert Cutler and "counselors" like McGeorge Bundy are the preferred roles, but there have been "agents" like Henry Kissinger and mere "administrators" like Sidney Souers. Bose may wish to go beyond this worthy, if narrowly focused, comparative case study to create a full-scale analysis of the range of advisory structures available to presidents in national security policymaking.

Demanding Choices: Opinion, Voting, and Direct Democracy. By Shaun Bowler and Todd Donovan. Ann Arbor: University of Michigan Press, 1998. 198p. \$42.50.

Simon Hug, Université de Genève

Interest in the instruments of direct democracy (e.g., referendums and initiatives) has increased considerably over the last few years. Their more frequent use at the state level and cross-nationally, as well as the introduction of provisions for initiative and referendum in several new constitutions, largely explains this interest. Debates about the advantages and disadvantages of these instruments of popular decision making often focus on whether citizens are competent enough to make important and often complex policy choices. Shaun Bowler and Todd Donovan address this central issue and provide a fresh, systematic, and theoretically guided look at this core topic.

As Bowler and Donovan correctly argue (p. 9), most of the debate on citizen competence in direct democracy gets quickly sidetracked into normative quarrels about whether particular outcomes of popular votes were "good" or "bad." The authors of *Demanding Cholces* attempt to avoid this normative pitfall by focusing exclusively on "how voters manage the demands imposed on them by the process [of direct democracy]" (p. xiii). Using as a starting point the notion of the "reasoning voter," Bowler and Donovan derive a theoretical framework applicable to voting in direct democracy. Relying on the notions of heuristics and decision cues, they focus on three elements they deem central in the voter's decision: "avoiding uncertainty by voting no, using instrumental evaluations of propositions, and taking cues from political elites" (p. 33).

In the context of elections the "reasoning voter" may rely

on a recurring set of decision cues, which are largely absent in the realm of direct democracy. Issues change from one vote to the next, the campaign environment differs, partisan cues are often absent, and so on. Faced with this challenge, Bowler and Donovan provide empirical illustrations from ballot contests in several states, mostly California. Using both individual-level survey data and aggregate data, they demonstrate in various contexts how citizens employ cues and heuristics in direct democracy. They show that voters, faced with ever longer ballots and increasing informational demands, vote selectively and more frequently "no" on proposals that appear at the end of the ballot. Similarly, economic conditions in a state are sometimes used as cues by voters with lower levels of education, who are more likely to vote against ballot measures when economic times are bad. Bowler and Donovan also report evidence for instrumental voting. The strongest results come from their aggregate analyses, more specifically from votes on prohibition measures. Systematically, counties with higher dry wine production voted more strongly against prohibition at the beginning of the twentieth century. At the individual level, some scant evidence suggests instrumental voting on California's Proposition 13 (tax revolt) among voters with lower levels of education.

Linked to the analyses of the decision heuristics, two chapters focus on initiative logrolling and the effect of campaign spending. Both elements affect the informational demands imposed on voters. An important trend in several states is the appearance of initiatives stitching together various proposals that benefit a series of constituencies. Such distributive logrolls appear to result in instrumental voting among those with high education levels, since they vote more strongly in favor of one such proposal if they live in a targeted area. Some of the other evidence presented on competing ballot measures is less convincing, however. For example, Bowler and Donovan analyze voting on two initiatives on flshing in the Columbia River at the beginning of the twentieth century. Since the initiatives aimed at making fishing almost impossible either upstream or downstream, the geographical distribution of the vote strongly related to the distance from the mouth of the river. But given the aggregate nature of the voting data on these two propositions, it is hard to determine how the voters coped with these competing proposals, and whether they simply decided instrumentally to vote in favor of one and against the other proposal.

On much more solid ground is the argument on campaign spending. Spending decisions by interest groups often reveal a considerable amount of information about the proposals on the ballot. Hence, even for high-spending narrow interest groups it proves difficult to pass an initiative proposal. Such high spending often reveals the nature of the true beneficiaries of particular ballot measures. The effect of high spending seems much stronger, however, in "no" campaigns. Spending on the "no" side often appears intended to increase uncertainty, which, as demonstrated by Bowler and Donovan, may lead voters to cast a "no."

Generally, these analyses on the role of heuristics in votes on ballot measures are of great value. They draw on diverse empirical materials and employ a range of data sources and methods. For the reader interested in the specifics of the empirical cases analyzed, a bit more information would have been welcome. For instance, an empirical model with type of ballot proposal introduced as a series of dummy variables and a constant term should be accompanied with an indication of the omitted category (p. 53). The interpretation of the results would be considerably enhanced. Similarly, some empirical models are probably underspecified (such as county-level

vote on prohibition as a function of religious affiliation and dry wine production), and problems of ecological inferences sometimes are hardly addressed. With respect to the three types of heuristics employed by voters, an interesting addition would have been a joint analysis for a particular vote. Obviously, such analyses are difficult to carry out, given the varied nature of ballot measures.

Nevertheless, *Demanding Choices* provides a thorough and theoretically guided look at the competence of citizens in direct democracy. Fruitful next steps in this wider research agenda would consist of systematic comparisons between voter and legislator competence as well as comparisons of policy consequences of direct democracy. The Bowler and Donovan book, together with such further research, would lead to a much more informed debate between advocates and opponents of direct democracy.

Environmental Injustices, Political Struggles: Race, Class, and the Environment. Edited by David E. Camacho. Durham, NC: Duke University Press, 1998. 232p. \$17.95 paper.

James P. Lester, Colorado State University

There is a burgeoning literature on "environmental racism," or environmental injustice, the thrust of which is that a disproportionate share of toxic harms are born by persons of color and/or the poor. This literature, which has developed largely since the late 1980s, has grown enormously and has passed through several stages. The first wave (roughly during the 1980s and early 1990s) was quite crude and largely limited to case studies of so-called instances of environmental racism. The second wave, beginning in the mid-1990s, is much more sophisticated and increasingly calls into question some of the racist claims of the earlier literature. At present, the literature on environmental injustice reflects the debate over whether environmental racism exists and what should be done about it as far as policy design is concerned.

In this book, David Camacho and his colleagues aim to offer a fresh look at a set of environmental injustice issues and what they believe to be "a more useful perspective on the topic than the empiricist approach common to much policy analysis" (p. 2). Indeed, Camacho asserts "that the distinction between what can be known and measured (facts) and that which is not verifiable (values) is particularly limiting in thinking about and resolving complex social problems" (p. 2). In essence, he invites readers to take a postpositivist journey with him and his colleagues as they attempt to convince us that the causes and consequences of environmental injustice may be located in hierarchies of political and economic power in the United States. According to this logic, "political solutions must be stressed over legal or scientific ones" (p. 4). We are immediately led to believe that this study will not adopt scientific (logical-positivist) techniques of analysis and attempt to reach a policy recommendation based on such criteria as rationality, equity, and/or efficiency; instead, we can expect a normative or political approach to policy analysis.

The editor and contributors do not disappoint. The book is rife with examples of environmental injustices in various contexts, including Arizona, Colorado, New Mexico, Ohio, and Texas. These examples include discussions of Native Americans and women as they confront instances of environmental injustice. Typical of the arguments in this book is the one by Mary Timney, who maintains that "it is irrelevant whether environmental injustice represents conscious racism, or classism, on the part of policymakers, either now or in the past... what truly matters is how the problems are addressed

by policymakers and business interests in the present" (p. 181). Camacho closes the book by arguing that "a change in individual attitudes and behavior is necessary before deliberations begin... This will require strong moral action... [which includes]: (1) direct control of access to ecosystems; (2) economic influence over markets through (a) the levying of taxes, (b) the imposition of fines, (c) subsidies for specified forms of ecosystem usage, and (d) various price controls over market producers" (pp. 210–22).

If one adopts the perspective used by Camacho and his

colleagues (described in the Introduction), then the "evidence" presented in the case studies leads inevitably to the conclusions stated by Camacho and reinforced throughout this book. What is sorely missing is any countervailing evidence that would call into serious question the claims made. Such evidence exists (see Christopher H. Foreman, The Promise and Peril of Environmental Justice, 1998; John A. Hird, "Environmental Policy and Equity: The Case of Superfund," Journal of Policy Analysis and Management 12 [Spring 1993]: 323-43; Douglas L. Anderton, "Methodological Issues in the Spatiotemporal Analysis of Environmental Equity," Social Science Quarterly 77 [September 1996]: 508-15; Vicki Been, "Analyzing Evidence of Environmental Justice," Journal of Land Use and Environmental Law 11 [Fall 1995]: 1-36; Susan Cutter, "Race, Class, and Environmental Justice, Progress in Human Geography 19 [March 1995]: 107-18; James T. Hamilton, "Testing for Environmental Racism: Prejudice, Profits, and Political Power," Journal of Policy Analysis and Management 14 [Winter 1995]: 107-32), but the editor and his colleagues do not cite it. Such an approach is unfortunate because, as Christopher Foreman argues in his recent book, The Promise and Peril of Environmental Justice (1998, p. 117), "the advocates of environmental justice pose a potentially serious . . . danger to the minority and low-income communities [they aspire] to help. By discouraging citizens from thinking in terms of health and risk priorities . . . environmental justice can deflect attention from serious hazards to less serious or perhaps trivial ones."

In other words, if policy remedies are to be developed, they need to be targeted to the appropriate cause; if not, the remedies may not work. Thus, we are at a crucial point in terms of policy designs to alleviate the potential problems of environmental injustice. Policy analyses could help in the formulation of a policy that is just, efficient, and rational, but the authors of this book do not provide them. Instead, they offer their assessment of the problem and attendant solutions without benefit of a careful analysis. Their "solutions," however, might make the problem worse by wasting scarce federal and state resources, which would be targeted on the basis of race or class or politics rather than on the basis of the health and safety risks posed to minorities and nonminorities as well as the poor.

In summary, this book will be useful primarily to advocates of environmental justice who have made up their mind about the nature of the problem and the solution; it will be less useful to policy scholars seeking to understand the root causes of "environmental racism or classism" and the most rational, equitable, and efficient ways to remedy it.

The Boundaries of Blackness: AIDS and the Breakdown of Black Politics. By Cathy J. Cohen. Chicago: University of Chicago Press. 1999. 394p. \$18.00 paper.

Michael K. Brown, *University of California, Santa Cruz*What defines the political interests of African Americans? It is usually assumed that black politics centers on a political

agenda defined by racial issues. African Americans see themselves bound together by a linked fate grounded in a common experience of oppression and mistreatment. This linked fate overrides other divisions among them, notably social class and gender; race comes to be seen as a proxy for individual self-interest and the crucial resource for political mobilization. In *The Boundaries of Blackness*, Cathy Cohen takes dead aim at the notion of a widely shared political agenda at the core of black politics. She states that "where once consensus issues dominated the political agendas of most black organizations, these concerns are now being challenged and sometimes replaced by cross-cutting issues and crises rooted in or built on the often hidden differences, cleavages, or fault lines of marginal communities" (p. 9).

Cohen examines the rupture in black politics by looking at the response of African American opinion makers and political elites to the AIDS crisis, an event that has disproportionately affected African Americans. Cohen is interested in understanding "how groups, in particular African Americans, came to conceptualize [the AIDS] epidemic and their relationship to it" (p. 119). To answer this question she examined the response of black newspapers and magazines; black political organizations, such as the NAACP, Urban League, and SCLC; and the congressional black caucus. Her research is as revealing as it is meticulous. Cohen documents a failure of leadership. Black elites were slow to respond, and when they did, their response was grudging and failed to acknowledge the dimensions of the problem. Eventually, they lent their support to provision of health and social services to those afflicted by AIDS but continued to condemn the life-styles of black gay men and drug users. The AIDS crisis was more or less addressed, but black elites never embraced it as a political issue vital to all African Americans and never took it upon themselves to "transform fundamental thinking in black communities about this crisis" (p. 118).

This distinction between ameliorative and transformative leadership runs throughout the book and is central to Cohen's analysis of black politics. Cohen frames her study of the response to the AIDS crisis with the concept of marginality. Marginal groups are excluded from social and political institutions, stigmatized, and lack control over their lives. Consequently, they must rely on indigenous resources to launch political resistance (pp. 52-3). Problems arise with the internal stratification of marginal groups, that is, a despised minority within a marginal group is ignored, denied resources, and excluded—treated much the way the marginal group is treated. Cohen views this secondary marginalization and its implications for black politics as the real subject of her book. The failure of black leaders to transform the understanding of AIDS matters precisely because it calls into question the underlying premise of black politics. If the assumption of a linked fate and the reliance on indigenous resources serves only one strata of the African American community, then a "reevaluation of black communities' reliance on linked-fate political mobilization strategies" may be necessary (p. 292).

What is one to make of this argument? Assertions that class or gender divisions matter to black politics are commonplace. Cohen's distinctive contribution is to set the analysis of internal stratification of marginal groups within the logic of oppression experienced by such groups. Black elites face powerful demands to conform to values of the white majority, which in turn lead to incentives to regulate or suppress the behavior of group members who might call the credibility of blacks into question. The dilemma is that this undermines the legitimacy of a common black political agenda while leaving black gays and lesbians subject to

mistreatment or neglect not only by white racists and homophobes but also by members of their own group.

This is an important and insightful statement of the fragmentation of contemporary black politics. Yet, two questions should be raised about Cohen's account of the AIDS crisis. Much hangs on how the concept of secondary marginalization is understood and measured. The key measure appears to be the failure of black political elites to transform the thinking of African Americans on the issue or use it as vehicle for political mobilization (pp. 247-8, 253, 267-8, 270, 275, 291-2, 294, 311). Although the black political agenda on AIDS did change—Cohen scrupulously acknowledges the efforts by 1990 of black elites to deal with AIDS—it did not go far enough. It appears that Cohen considers the absence of transformative leadership a form of secondary marginalization. This may be so, but the argument is never clearly made, which leaves the question of how one determines when secondary marginalization occurs or does not occur. This matters if one wants to apply the theory to other groups, as I think Cohen does.

The other question has to do with the transformation of the black political agenda. Cohen raises the important question of how the political agenda of a marginal group changes, be it a racial group, gays and lesbians, or a marginalized religious sect. She appears to believe that political agendas are reshaped by pressure from below, and one of the more interesting parts of the book is her account of the political struggles of black gays and lesbians to change the thinking among blacks about AIDS. But this is not the full story. In fact, Cohen's analysis seems to suggest that AIDS became part of the black political agenda as it became a significant political issue within American society. What is missing from her account is what Hanes Walton (African American Power and Politics, 1997) calls political context. Walton uses this idea to understand how changes in the actions and beliefs of whites shape black politics. Similarly, one might ask how changes in the broader society toward gays and lesbians over the last twenty years shaped the response to AIDS within the black community. A comparison of the black response to AIDS with the white response would have illuminated this

This provocative and thoughtful book will be of interest to anyone concerned with the political dilemmas facing exploited groups, not just African Americans.

Making Democracy Work Better: Mediating Structures, Social Capital, and the Democratic Prospect. By Richard A. Couto, with Catherine S. Guthrie. Chapel Hill: University of North Carolina Press, 1999. 336p. \$49.95 cloth, \$19.95 paper.

Harry C. Boyte, University of Minnesota

Despite the successes of the American economy, many have been left out of the economic expansion. The nation's poverty rate declined during the 1990s, but it has yet to fall below the 12% mark. Poverty is not uniformly distributed. Critics have described the plight of inner cities and rust belt industrial regions. What is less well known is the continuing economic hardship in the Appalachian region of the southern United States. Appalachia is a land known for beautiful fall colors, the Blue Ridge Parkway, and bluegrass music. A strength of Richard Couto's new book is to give the region more human texture. The author describes its continuing poverty. Moreover, building on field interviews and case studies by Catherine Guthrie, Couto also makes a contribution through chronicling the stories of citizen groups who

have struggled in the last generation against poverty, environmental degradation, and other social ills.

Far less successful is Couto's attempt to theorize about these citizen efforts. Following the lead especially of Robert Putnam's famous article ("Bowling Alone," Journal of Democracy 6 [January 1995]: 65–79), Couto uses the concept of "social capital" as his guiding theme. Indeed, his title is a gloss on Putnam's earlier book, Making Democracy Work: Civic Traditions in Modern Italy (1994), which is an interesting treatment of the interplay between civic engagement in voluntary associations and the functioning of regional governments and economic development. Couto seeks to redress what he perceives as weaknesses in Putnam's treatment of social capital, but he misses the forest for the trees. It is the concept of social capital itself that is flawed by the effort to turn into the categories of social science what are better understood as questions of politics.

Making Democracy Work Better has lively treatments of citizen organizations in central Appalachia and adjacent areas. Couto and Guthrie studied 23 groups that the authors call "community based mediating structures," all of which received funding from the Commission on Religion in Appalachia. The commission's explicit grant criteria included the requirement that groups have representation from people who are served and employ strategies for mobilizing citizens. In practice, the commission, a liberal church group, favors groups tilted toward the Left—none of Couto and Guthrie's choices seem to be identified with Christian conservatives, the Republican Party, or the like. But the activist flavor of the groups and the nature of their issues enlist participants with a mix of ideologies. They are better called "populist" than "liberal."

We read about groups such as the Appalachian Center for Economic Networks (ACEnet), which implemented strategies for economic development in eight counties of southern Ohio; it drew inspiration from the Mondragon area of northern Spain and from development approaches in Denmark and northern Italy. Couto and Guthrie also treat groups such as the Bumley Gap Concerned Citizens (BGCC) in Washington County, Virginia. BGCC members waged a five-year battle that was ultimately successful against a plan by the enormous Appalachian Power Company to flood their valley. Many residents' motivations are better understood as conservative than as liberal. "There isn't much of this heritage left in America," explained one (p. 88). Countless community organizations have drawn from similar wellsprings in recent decades, battling the advocates of progress.

Couto and Guthrie hint at the inadequacies of current conventional civic theory, such as the notion of citizen as "volunteer." For example, BGCC organizing was launched by a Presbyterian minister, Richard Cartwright Austin, whose work took on new meaning. Austin was a citizen activist, educator, and organizer rolled into one. "Tve never had a clearer experience of working as a catalyst," he recalled. "Everybody was ready to do something, but no one knew where to start" (p. 86). Small business owners, federal employees, and sympathetic journalists all became involved. What were the new understandings of work that their activism generated? Did the organizing affect their wider institutional cultures? Did their careers continue to have new public meanings? Such questions about the public dimensions of work and institutional cultures are rarely asked in a current theoretical context that locates citizen action in the "voluntary sector" or "civil society" and advances the volunteer as the model citizen.

Couto does not ask these questions either. Instead, he

takes Putnam and other theorists of social capital to task for what he sees as their conservative ideological effects. In his view, social capital as a generator of social trust obscures dynamics of power and patterns of inequality. He seeks to add what he calls political dimensions to the concept, arguing for the idea of "mediating structure" as a force in political struggle. Couto's agenda is unabashedly progressive. The title of an old labor song from the 1930s is his touchstone: "Which Side Are You On?"

Couto's ideological version of social capital is ultimately no more successful than Putnam's effort to diagnose the ills of American civic life in terms of levels of social trust and social networks. In both cases, civic relationships are conceived in instrumental terms. Put differently, the "publicness" of citizens of diverse ideologies, experiences, and perspectives who join together in action on the tasks of a common world, as Hannah Arendt (*The Human Condition*, 1958) would have put it, disappears. With the loss of such publicness, the generativity and spirit of public life erodes, and our sense of politics is radically impoverished.

Interestingly, it is precisely such rediscovery of public action by citizens that has made citizen organizing most interesting, in practice and in civic language alike, over the last generation. To cite one example, the network of large citizen organizations in the Industrial Areas Foundation explicitly takes up projects that cross diverse lines of ideology, class, religious belief, and culture. It articulates the Arendtian idea of care for the world. It sees itself functioning in (and helping to create) a public space of diverse and heterogeneous relationships.

If we are to understand either the discontents or the possibilities of democracy, then we need studies that understand citizens to be more than community members, volunteers, advocates, or ideological partisans. We need a theory that views citizens as multidimensional public actors and a politics worthy of the calling.

Identity and Power: Puerto Rican Politics and the Challenge of Ethnicity. By José E. Cruz. Philadelphia: Temple University Press. 1999. 278p. \$59.95 cloth, \$22.95 paper.

Kim Geron, California State University, Hayward

Demographic changes in the United States are creating a new dynamic as nonwhite immigrants transform the social and political landscape not only in such traditional entry cities as New York, Los Angeles, and Miami but also and increasingly in small and mid-size cities. In response to these rapid population changes, and the ethnic strife in Eastern Europe, some scholars view the promotion of ethnic identity politics, in a multiethnic context, as leading to separation and balkanization. José Cruz challenges this one-sided perspective of ethnic identity. Through an exploration of the political experiences of Puerto Ricans in Hartford, Connecticut, from the 1950s to the 1990s, Cruz finds that identity politics served as "a voice for a marginal group, structuring their agenda, and facilitating their incorporation" (p. 207).

The focus of the book is on Puerto Rican immigrants, who were granted U.S. citizenship early in the twentieth century but were viewed by the local political establishment as the other, similar to other nonwhite immigrants, upon arrival to the mainland in significant numbers in the 1950s. Until the late 1960s, the Puerto Rican community played by the rules of the Democratic Party's local machine politics. As poverty, discrimination, and joblessness grew and political benefits did not materialize, Puerto Ricans reacted with street protests in the late 1960s to demand inclusion and equality. Later, to

overcome exclusion from machine politics, they skillfully organized their community around electoral mobilization politics. Using a variety of electoral vehicles, most notably the Puerto Rican Political Action Committee (PRPAC), Puerto Ricans began to be elected to local and state offices. Among the many accomplishments of the PRPAC was the formation of a progressive multiethnic coalition that challenged the local machine organization and achieved electoral victory in 1991. Just two years later, the voters turned the multiracial coalition out of office.

To explain the dramatic rise to power and the subsequent defeat of a promising electoral coalition, Cruz explores the relationship between identity politics and urban power. He argues that the construction of an ethnic identity served as an organizing beacon for newly arrived Puerto Ricans, who were poor, spoke a different language, and had no job skills. The central argument is that "identity politics was not a stage in the process of incorporation, one to be left behind by integration. It was instead both the medium for and outcome of political mobilization" (p. 10). Identity is a constant, but identity politics is an ever-changing process based on the "ebb and flow of issues, agendas, and available resources" (p. 11).

In Cruz's view, there is a two-stage process of identity politics and urban politics. First, there is a mobilization based on identity politics for political representation; second, following an election, a new stage occurs, based on power relationships and policymaking that extends beyond identity politics. The notion of urban power is used to explain what happened when Puerto Rican identity candidates were elected to office.

This book is situated in the context of the ongoing debate about the limits of local government in an era of structural constraints. Cruz attempts to synthesize previous explanations of power in an urban setting and build "a contingency theory of power" (p. 17) to explain how access to power takes place, and he identifies some of the elements that affect its exercise. Puerto Ricans were unable to move from representation to effective policy responsiveness because of the economic, political, and social context when power was achieved. The unseating of the progressive coalition in 1993 was the result of several factors, including weak internal cohesion among the Puerto Rican officeholders, interethnic conflicts with African Americans over political spoils, fiscal crises, and the failure to understand how policymaking is accomplished in a complex, business-dominated climate. Ethnic identity served as a mechanism to win elections, but identity politics was not sufficient to govern in a multiethnic environment.

Cruz makes an important contribution to the contemporary literature on Latinos in politics and the broader question of the value of identity politics for power achievement. Studies on Latino participation in politics are growing in number and scope, with some scholars focusing on the attitudes and voting behavior of Latinos. Recent research has moved away from case studies of grassroots efforts to achieve democratic rights, but this does not mean that Latinos have ceased to struggle for political empowerment. This book is reminiscent of case studies conducted on urban Latinos in the 1970s and 1980s. It is rich in detail and offers a nice counterbalance to recent macro and quantitative studies of Latinos. By zeroing in on the variable of political agency and conducting in-depth interviews with many of the key participants, Cruz is able to give voice to the activists' motivation and strategic considerations for their actions.

Cruz also challenges some contemporary notions of identity politics and refuses to fall into the trap of glorifying or reifying identity politics. His book is a sharp rebuke to those

who argue that diversity and ethnic identity politics are causing the disuniting of America (Arthur Schlesinger, The Disuniting of America, 1992). In Hartford, Puerto Ricans used ethnic identity politics in a positive manner, not to divide but for positive reinforcement. As the country grows increasingly diverse, multiethnic coalitions loom large on the horizon in urban centers, and the experience of Hartford's Puerto Rican community is revealing. The dilemma of officeholding and being responsive to the policy needs of one's ethnic community while simultaneously reaching out to other ethnic and issue-oriented groups is a topic that needs considerable study. If the purpose of ethnic politics is to elect ethnic candidates with the understanding that there will be increased policy benefits, then the evidence provided by Cruz is that there are two different rubrics to consider, office achievement and officeholding.

The book is not without shortcomings. First, in a detailed discussion of an active community with numerous political organizations, a system of categorizing the various groups, key issues, leaders, and time span would strengthen Cruz's argument of endogenous diversity. Second, the commonwealth status of Puerto Rico poses unique issues for Puerto Ricans who migrate to the mainland. There is substantial discussion about why Puerto Rican immigrants focused more on local politics than island politics, but there is little analysis of the value and symbolism of U.S. citizenship that Puerto Ricans enjoy upon arrival but that other immigrant groups do not. This appears to be a major factor that enabled the Puerto Rican community to move rapidly from new immigrants to officeholders in less than three decades.

Finally, Cruz's attempt to link identity politics with urban power requires a deeper discussion of the overall development of progressive politics in Hartford. It is difficult to grasp the mobilization strategies of the other coalition forces, such as the People for Change (PFC), a progressive white group, labor activists, and African Americans—the largest nonwhite racial group. The strength of this book, the focus on power attainment by Puerto Ricans, limits a fuller discussion of citywide politics and how urban power relations unfolded in the critical period 1985–91.

These minor criticisms notwithstanding, Cruz overall does an admirable job of describing the complex process of identity politics at the local level and how a new immigrant group was able to build electoral strength. One hopes this study is a portent of future ethnic and multiethnic case studies documenting the transformation of America into a majority nonwhite society in the new century.

The Constitutional Underclass: Gays, Lesbians, and the Failure of Class-Based Equal Protection. By Evan Gerstmann. Chicago and London: University of Chicago Press, 1999. 196p. \$35.00 cloth, \$15.00 paper.

Ronald J. Hunt, Ohio University

At the heart of Evan Gerstmann's book is the argument that class-based equal protection jurisprudence has failed to protect the interests of gays and lesbians as well as other minority groups, such as the poor and the elderly. As evidence, the author cites a vast array of court decisions that have denied gays and lesbians equal protection of the law: decisions upholding the prohibition against immigration to the United States and against employment by the FBI, the "don't ask, don't tell" policy, and state sodomy and custody laws.

The author presents his case in three parts. In the first part, he explains the origins of class-based equal protection; the

differences among "strict" scrutiny, "intermediate" scrutiny, and "rational-basis" scrutiny; and the underlying inequity and incoherence inherent in this system. The Supreme Court has devoted an inordinate amount of time and energy to elaborating the principles governing its decision making, but in Gerstmann's judgment there have never been clear standards defining the levels of scrutiny, and this has led to an invidious discrimination against many groups by the federal and state courts.

Gerstmann describes the gradual incorporation of the Carolene Products framework into the Court's decisions governing African Americans in such cases as McLaughlin v. Florida and Loving v. Virginia, cases in which the Court established that race-based classifications would be subject to the highest level of scrutiny and also extended strict scrutiny to "alienage" as well as a growing list of "fundamental rights" (e.g., the right to vote) deserving protection.

For obvious reasons, gays, lesbians, and other groups who claim a history of discrimination have sought to establish their entitlement to strict scrutiny by the courts. From Gerstmann's point of view, however, this outcome is highly unlikely. Why? "It is no small step to declare that factors such as prejudice toward a particular group render democratic decisions regarding that group 'suspect.' It means putting on the judicial table all manner of laws regarding that group" (p. 36). With the growth in the 1960s and 1970s of the number of groups who claimed discrimination, the Court realized the Pandora's box it had created and slammed the door on all groups claiming suspect status. "No group since the mid-1970s has been found to be a discrete and insular minority and it is unlikely that any new group ever will be" (p. 29).

In the second part of the book, Gerstmann discusses the failure of the class-based equal protection framework to protect the rights of gays, lesbians, and, by extension, other similarly situated groups. His focus is Amendment 2, enacted by Colorado voters in 1992. It overturned existing civil rights protections for gays and lesbians in Boulder, Denver, and several other jurisdictions, and it forbade the enactment of similar protections by the state or any of its agencies, subdivisions, or municipalities. The author provides great insight into various aspects of the political struggle that surrounded the adoption of this amendment, including the highly novel argument that the equal protection framework of the Court was used by proponents of Amendment 2 to convince the public that gays and lesbians would soon be claiming affirmative action status if the measure was not adopted. Gerstmann also demonstrates the ultimate incoherence of the class-based equal protection framework through his analysis of the wildly varying judicial opinions written about the applicability of strict scrutiny to gays and lesbians and of the constitutionality of Amendment 2. "None gave any clear reason why Amendment #2 does or does not violate the equal protection clause" (p. 115). Ultimately, the U.S. Supreme Court in Romer v. Evans sustained both the Colorado District Court and the Colorado Supreme Court in upholding an injunction against the enforcement of the amendment. According to Gerstmann, however, the opinion of the U.S. Supreme Court can only be understood as an emotional response to the imbroglio. "The ostensible standards for deciding equal protection cases were largely ignored, and the case ultimately came down to the Supreme Court's intuitions about how the Colorado voters felt about gays and lesbians" (p. 115)

Most fundamentally, the author is convinced that both the federal and state courts apply the class-based equal protection framework in a highly arbitrary and biased manner, not so much because of their prejudices as because of the U.S.

Supreme Court's unwillingness to extend strict scrutiny to more and more groups, something the Court undoubtedly feels would expose the institution to further criticism for legislating from the bench. This has led the Court, among other things, to invent conventions such as intermediate scrutiny to cover issues related to gender discrimination and to apply differential levels of rigor to the rational basis test, a practice that the author calls "cheating" and that illustrates the incoherence and confusion generated when groups with clear histories of discrimination are denied the same level of protection as African Americans.

The final section of this stimulating book discusses alternatives to the current approach. Gerstmann concludes that, since the Court cannot apply strict scrutiny to all laws, there must be a clearly defined method for differentiating among levels of scrutiny. Following the lead of J. Harvie Wilkinson ("The Supreme Court, the Equal Protection Clause, and the Three Faces of Constitutional Equality," Virgunia Law Review 61 [1975]: 945–1018), Gerstmann elaborates and comments on Wilkinson's argument that issues related to who has been denied equality should be subordinated to what kind of equality has been denied. The balance of this insightful and provocative book is devoted to a critical reflection on the merits and limitations of Wilkinson's ideas, a reflection that should add to the existing scholarship on the limits of class-based equal protection jurisprudence.

The Constitutional Underclass is thought provoking, insightful, and readable. That there are both legal and political problems associated with class-based equal protection is obvious. Gerstmann succeeds in elaborating the full extent of the problems, the innumerable ramifications, and the potential of alternatives to the status quo.

Forged Consensus: Science, Technology, and Economic Policy in the United States, 1921–1953. By David M. Hart. Princeton, NJ: Princeton University Press, 1998. 267p. \$39.95.

Roger G. Noll, Stanford University

Research on technological change and the policies affecting it is voluminous. Nevertheless, as David Hart notes, this literature hardly rests at the center of any discipline. Despite the importance of technology in modern society, most scholars pay little attention to scholarship about it, and the lessons from this research are accorded an incidental role in undergraduate and graduate education.

Hart's goal is ambitious: to bring the political economy of technology policy to the forefront of research on American politics. He seeks to do so by building a stronger, more sophisticated theory of science policy that is embedded in broader theories of policymaking m the United States (chap. 1) and by using the historical development of science and technology policy in the crucial period since World War I to test his theory (the rest of the book).

Hart's foundational assumption is that policy arises from the pursuit of goals by political officials that emanate from "ideas" (opinions about cause-effect relationships melded with normative views of the nature of a good society and the proper role of government in attaining it), as constrained by the necessity to mobilize support among interests, to overcome institutional resistance, and to make compromises to form coalitions with others pursuing their own idea-driven goals. Thus, whereas self-interest, collective-action problems, and agenda-setting effects of institutions have roles, the centerpiece is ideas.

Hart believes that research on the politics of technology

policy has little effect because it rests on a simplistic, two-part 'conventional wisdom," derived from Vannevar Bush's activities to institutionalize government research and development after World War II. First, postwar technology policy is said to be highly stable, reflecting a broad consensus about the proper role of government in generating new technical knowledge. Second, this consensus is said to arise from two widely shared normative values: economic liberalism (giving privileged status to the market as a means for advancing the welfare of society) and "transaction cost economics," by which Hart means market failures (identifying specific areas in which market incentives are insufficient to generate socially desirable activities, such as basic research; research and development related to government activities such as national defense; and technology transfer to generate commercial "spin-offs" from government research and development).

Hart contends that technology policy is not stable and does not reflect an enduring political consensus; instead, it is an eclectic grab bag that periodically changes dramatically. Moreover, Hart argues that the conventional explanation cannot identify with acceptable precision the actual programs and policies that government adopts. The trouble, according to Hart, is that economic liberalism plus market failures do not clearly delineate what government will do; they are contested concepts with changing definitions and boundaries that reflect changes in the underlying normative values that motivate government decisions.

As an alternative, Hart offers five "visions" of the role of government in the economy that motivate different political actors, and he hypothesizes that technology policy changed during the twentieth century due to changes in the relative influence of these visions within governing coalitions. These five visions are: (1) traditional conservatism, which is skeptical of any role for government in the economy; (2) associationalism, that is, government can help overcome market failures that harm business by supporting information exchange, standardization, cooperative applied research, and basic research that underpins commercial technology; (3) reform liberalism, or government can overcome market failures that harm consumers and that arise from myopia, greed, and economic power; (4) Keynesianism, or the main market failure is macroeconomic instability, which government can control through taxes, expenditures, and monetary policy, which are selected in part on the basis of their effects on long-term economic growth; and (5) the "national security state," that is, a hostile external world gives privileged status to national security policies, including defense-related research. A sixth vision, a Marxist neo-Luddism that sees technology as a means to generate unemployment and cut labor costs, periodically is on the scene, but its adherents never manage to influence technology policy.

The book's strength is detailed histories of technology policies from Hoover's establishment of the Bureau of Standards through the hardening of the Cold War during the Truman administration (chaps. 2–7). Most readers probably will learn quite a bit about the nuts and bolts of technology policy during this era. In recounting this history, Hart emphasizes the controversies and differing perspectives of officials concerning the government's role in R&D. He succeeds in demonstrating his two main points: Most important technology programs arose amid controversy, and they reflected compromises among different perspectives about the importance of market failures in R&D and the ability of government to enhance technological progress.

Whether these accomplishments constitute an important new way to conceptualize technology policy that will propel the field into the mainstream of American politics is less certain. Some scholars may be perplexed by Hart's argument. His "conventional wisdom" accurately characterizes how many public figures frame policy debates, including some technology policy scholars whose disciplinary roots are in science and engineering. But relatively little work in economics and political science adopts this approach. Many scholars regard the market failure notion as useful for identifying what government ought to do and for evaluating the success of government policies, but few regard this normative model as a useful positive theory of policy choice. Finally, the ideas that motivate political actors surely are important, and characterizing them in a nuanced, comprehensive manner advances understanding of policy, but the importance that the book accords them is debatable. Other concepts in American politics are mentioned, such as reelection motives of elected officials, career motives of bureaucrats, economic interests, mobilization bias, political entrepreneurship, and the agenda-setting role of bureaucratic and legislative institutions, but they are given less emphasis than in most contemporary studies of the politics of policymaking in the United States.

Of course, to expect a book to reform a field is a tall order. Hart succeeds in articulating a new view of the relationships between technology policy and conflicting ideologies about the role of government in the economy, and he illustrates how these normative conflicts relate to policy choice in an important domain of government activity. This accomplishment is enough to make the book worth reading.

Representing Popular Sovereignty: The Constitution in American Political Culture. By Daniel Lessard Levin. Albany: State University of New York Press, 1999. 283p. \$59.50 cloth, \$19.95 paper.

John Brigham, University of Massachusetts, Amherst

Daniel Levin examines the Constitution in various public manifestations, but his sustained focus is on the Bicentennial Celebration in 1987. This effort joins law scholarship in the social sciences that has broadened the field by incorporating interpretation and cultural studies into jurisprudence. Levin is critically self-conscious about the social dynamics of constitutionalism, and his book develops new ways to think about the Constitution.

In the section on mass-market tie-ins, Chief Justice Warren Burger comments on how tasteful the placemats produced by McDonalds will be, and Levin notes, in a parody of the pretentious authoritizing of law review editors: "The placemats are on file with the author" (chap. 2, n 96). With reference to the problem of commodification, he reminds us of Bisontennial Ben, a bison character wearing federal period costume offered by the Disney Corporation but rejected by the Bicentennial Commission.

The book operates at a number of basic intellectual levels. Levin offers a fresh and thoughtful response to the unstated question: "What is a Constitution?" He sees limits in the "traditional understanding," with its focus on what the founding fathers thought of the Constitution. The founders likely would have been incapable of explaining the importance of the Constitution that we protect in the National Archives in "a bullet-proof canister [that] may be instantly lowered into a subterranean vault." Levin provides a sustained investigation of current cultural representations, including the dramatic display of the original parchment.

The chapters are laid out with a clear sense of the terrain and what we need to be thinking about. "The Problem of an Abstract Constitution" suggests that the Constitution lacks "sex appeal" because it is difficult to understand. "The Conscious Creation of Constitutional Culture" gives attention to efforts by Safeway and Winn-Dixie to make Constitutions available to their shoppers and the Bicentennial Commission's special zip code so mail could simply be addressed as "Constitution." "Representing Popular Sovereignty" ties the whole enterprise to culture studies more generally.

The notes are full of citations to contemporary scholarship. We sometimes fail to see ourselves as a shared enterprise, but Levin provides evidence that constitutional study is emerging as a field that takes its practitioners beyond Supreme Court doctrine. Some work is in critical theory, some is ethnographic, and there is even some political science. I did think that pioneering work published in the APSR should have been given more attention. Articles by William Harris ("Binding Word and Polity," American Political Science Review 76 [March 1982]: 34-45), on how we bind ourselves through the words in the Constitution and by Timothy O'Neill ("The Language of Equality," American Political Science Review 75 [September 1981]: 626-35), on the language of constitutional equality appeared in the early 1980s. More recently, published debates between Michael McCann (Rights at Work: Pay Equity Reform and the Politics of Legal Mobilization, 1994) and Jerry Rosenberg (The Hollow Hope, 1993), turn on the meaning of the Constitution in the polity. Clearly, more historians, lawyers, and journalist are doing this work, but this is also a political science project with a

Although the cumbersome comprehensiveness of the Constitution makes it difficult to arouse the public about it, that is generally the subject of the book. Instead of the whole thing, which the Bicentennial was admittedly celebrating, perhaps we should pay more attention to how we represent its parts. We have had compelling debates about which evidence was to be excluded in the O.J. Simpson murder trial, conflicts over the meaning of affirmative action, and differing perceptions about whether the trial of a sitting president is much of a distraction to work at the office. I teach about these things, and sometimes I am amazed at the appeal of such constitutional topics before the students even get to my lectures.

Levin helps us get beyond a persistent behavioralism and recalcitrant formalism. His scholarship also reminds us that popular constitutionalism has had programs such as the Jefferson Foundation meetings that predated the Bicentennial. The Jefferson approach could use some of Levin's insight about the limits of simulation, and the earnest practitioners of this form of Constitution study deserve a little critical attention of the sort Levin provides. Much of the book is pathbreaking analysis, but the debates on new institutionalism and constitutive theory show that we can handle even more expansive critical inquiry.

The book is also framed by a sort of gap or impact logic expressed as wonder at the failure of the Constitution to operate in the public sphere in the same way that the Declaration of Independence has operated. The caution appears in the limited nature of the frame. There is so much that is useful in the book that the old framework which seeks to register the effect of decisions is a bit of a straight jacket. For instance, the author might have explored the corporate nature of contemporary constitutionalism as a constitutive dimension of the Constitution's cultural life but notes instead that corporate rather than widespread popular support gives us a false notion of the private.

In this regard, some themes could have been developed more carefully. Levin states: "Sacred texts rarely enter the profane realm of popular culture" (p. 3). Although this may have been true of the Constitution, it does not seem to have been true of the Bible, the Torah, or any number of Zen teachings. There is a tone that draws attention to the political scientist's Constitution, the one that the public does not know about and that many have treated as if it were too complex for them to understand.

The orientation of the book and its contribution to American constitutional scholarship is entirely in the opposite direction. As does Michael Kammen's awkwardly titled but seminal historical work, A Machine That Would Go of Itself (1986), and work by scholars such as Sanford Levinson, Wendy Brown, and Michael McCann, this book helps show us that the Constitution is not simply what the judges say it is (no matter how much the bulk of political science publishing in constitutional law has invested in this belief).

Levin has Garry Trudeau providing in the *Doonesbury* comic strip a copy of the Constitution to be attached to a cereal box for "mighty fine breakfast reading" (2/22/1987), but Levin's book gives us a Constitution that is not just living but in search of a celebration.

Environmental Cancer—A Political Disease? By S. Robert Lichter and Stanley Rothman. New Haven, CT: Yale University Press, 1999. 235p. \$35.00 cloth, \$17.00 paper.

Howard Margolis, University of Chicago

This is a good book on an important matter, but the material it addresses is so highly polarized that a different reviewer might have characterized it as a perverse book on an important matter. The deep issue is the persistent conflict of expert versus lay intuition that has marked public concern over subtle environmental risks: that is, not risks such as smoking, which no one any longer even pretends is anything but a serious risk, but risks such as those from saccharin or electromagnetic forces (EMF), whose actual effects (adverse or conceivably even favorable) are sufficiently subtle that it is very hard to be confident that in fact there is any net adverse effect at all

On such issues, lay concern is often so strong that expert concern comes to be marked mainly by a reaction about misallocation of public health resources. This frequency of expert/lay conflict on such issues then yields a sort of second-order polarization among people who write about this contrast. Some of us find the predominant expert views on these matters convincing, and others believe lay judgment deserves far more respect than the experts are inclined to give it. But there is one obvious sense in which lay views have to be taken very seriously indeed: There are vastly more lay voters than expert voters.

Lichter and Rothman focus, as the book's title states, on cancer. That is not the only risk for which expert/lay conflict is apparent, but it is certainly the most prominent. The main novel material in the book comes from survey data on expert versus lay differences and from content analysis of mass media coverage. For APSR readers, this will be of some interest simply as applications of method. Overall, however, the results do not differ much from the impression provided (for example) by Stephen Breyer's (now Mr. Justice Breyer's) Vicious Circle (1993) and any number of other studies. So the market for this book may be limited.

The central point, as suggested by the title, is that concern about subtle environmental cancer risks is largely to be understood in political and sociological terms, strongly influenced by how things are treated in the press and by how politicians and bureaucrats respond to public sentiment. The

press is, of course, strongly motivated to cover what readers want to know about, and politicians are motivated to make choices that voters find easy to believe are right. This easily aggravates the large disparities suggested earlier between that for which experts find evidence and that which the rest of us seem most ready to believe. In turn, that affects what the press is motivated to report and what politicians find comfortable positions to take. A study that finds a link between some chemical and cancer is more likely to be reported than a study that finds no link. In turn, the concerns of the public are reinforced, which reinforces the propensities of the press and the sensitivity of politicians. Causation goes all the way round (hence Breyer's discussion of a "vicious circle"). Among the results is a far greater public perception of a cancer epidemic than actual data could possibly warrant. Hence the concern of this book with cancer as a "political disease."

The Democratic Dilemma: Can Citizens Learn What They Need to Know? By Arthur Lupia and Mathew D. McCubbins. New York: Cambridge University Press, 1998. 282p. \$64.95 cloth, \$19.95 paper.

R. Michael Alvarez, California Institute of Technology

This book has generated excitement in political science for a number of reasons. First, Lupia and McCubbins have translated the rational choice signaling model into terms that most political scientists understand. Second, the authors discuss recent advances from the cognitive sciences in the context of a rational choice signaling model. Third, they test propositions taken from their formal model with a new form of laboratory experimentation and with a telephone survey. Given these three different dimensions, it is no wonder that this ambitious book has generated a great deal of interest.

Lupia and McCubbins structure their argument in two parts. The first is theoretical (chaps. 2–5), and the second is empirical (chaps. 6–9). Their use of the rational choice signaling model and their integration of cognitive science advances fall into the first major component, and their laboratory and telephone survey experimentation falls into the second major component. Generally, the book is exceptionally clear in structure and writing.

The general theme is that democratic citizens can make "reasoned choices" when they are poorly informed. By "reasoned choices" Lupia and McCubbins mean those "based upon an accurate prediction about a choice's consequence" (p. 18). Being able to make an accurate prediction, however, requires accurate information. Obtaining accurate information requires decision makers to be active information gatherers. If they are, then they will be attentive to information sources beneficial to their choice—information that prevents them from making a bad decision.

Thus, "reasoned choice" is based on obtaining information from others, which Lupia and McCubbins call "persuasion." They argue, from their rational choice model, that "persuasion occurs only if the principal is initially uncertain about which alternative is better for her, believes that the speaker may have the knowledge which she desires, and believes that the speaker has an incentive to reveal what he knows" (p. 55, emphasis in original).

This is an interesting and clear set of theoretical propositions, but their exact scope is not clear. Lupia and McCubbins want to apply their theoretical model to virtually every level of political decision making, from voters to jurors to legislators. In the end, the assumptions underlying their theoretical model seem much more appropriate for some political decisions than others.

Most important, it is unclear whether this theoretical model applies easily to the decision problem facing voters in large elections. For example, the assertion that voters in contexts such as presidential elections are active seekers of information is a difficult assumption to maintain. In fact, one of the most important advances in this literature is the finding that there are vast differences across the American public in the degree of political awareness (John Zaller, *The Nature and Origins of Mass Opinion*, 1992). Segments of the mass public are essentially uninformed, other segments are well informed, and yet other segments fall somewhere in between. Clearly, it is incorrect to assume that the citizens in the mass public are all seekers of information.

Instead, this model of decision making seems best suited for contexts in which the stakes are greater—such as legislative decision making or juries. In these political settings the assumption of active information gathering makes sense; because higher benefits derive from making decisions of better quality, individuals in these contexts should be more willing to bear the costs of information acquisition than the mass public in the context of a presidential election. To borrow the assumption of active information seeking from cognitive science is interesting, but this assumption does not lead to a model with general applicability to all realms of political decision making.

The other assumption that Lupia and McCubbins borrow from cognitive science is "connectionism," which "is the way that people systematically connect current observations of their physical world to physical or emotional feedback from experience" (p. 19, emphasis in original). Exactly how this assumption fits into their rational choice model is not clear, and it does not seem to lead directly to any new inferences about political choices.

Chapters 7 through 9 focus on the empirical testing of propositions from the "reasoned choice" model. Readers unfamiliar with the "experimental economics" movement will find chapters 7 and 8 very useful. The types of experiments discussed in these two chapters are excellent examples of this exciting method for testing rational choice theories. These laboratory experiments are useful for demonstrating whether subjects play the experimental game in ways consistent with the mathematical predictions of the rational choice model, thus testing the internal validity of the model that Lupia and McCubbins use.

But these laboratory experiments lack external validity. That is, they do not tell us whether decision makers in real political contexts behave consistently with the predictions of the model. In chapter 9, Lupia and McCubbins use telephone survey experimentation to test propositions about persuasion. They posed questions about prison spending to survey respondents; to a randomly selected group the question was framed as either being supported or opposed by Rush Limbaugh or Phil Donahue. In relatively simple statistical tests, Lupia and McCubbins report that respondents followed the cues presented in this framing experiment, as they made statements about prison spending consistent with the position of the source of the cue, conditional on whether the respondent considered the source knowledgeable and trustworthy.

It is difficult to write an ambitious book that satisfies every reader, and I would have appreciated more empirical testing of the theoretical propositions, especially more testing with strong external validity. Even so, Lupia and McCubbins have produced an extremely useful work that makes theoretical and empirical contributions to the literature. Most important, the clear and thorough exposition of the rational choice

signaling model and the elaboration of the experimental laboratory method make this a book that should be required reading for political science researchers and students alike.

Getting Beyond Race: The Changing American Culture. By Richard J. Payne. Boulder, CO: Westview Press, 1998. 240p. \$25.00.

Robert C. Smith, San Francisco State University

Race is the most profound and enduring cleavage in American society and politics. It always has been. Therefore, the social science disciplines have always devoted an enormous amount of attention to the subject. No less is true today. Indeed, in the last several years the number of scholarly books has likely outpaced the capacity to keep up of all but the most indefatigable.

In this vast outpouring of studies, Richard J. Payne's Getting Beyond Race is different. Rather than focus on the historical, structural, systemic, or contextual bases of the problem, Payne, a political scientist, focuses on the individual. He takes this approach because he believes "race relations are ultimately about ordinary people interacting with each other on an individual basis" (p. xii). Getting Beyond Race takes us back to the pre civil rights era (circa 1950) of scholarship on race, an era when "race relations" studies sought to point the way out of America's racial dilemma by formulating the problem as psychological traits of individuals that translated into social and economic cleavages. Payne labels this a "bottoms-up approach," writing in the concluding chapter that this method of "improving race relations places greater responsibility on individuals to do what they can to get beyond race. General concern about how races interact must be supported by specific actions on the part of ordinary Americans toward each other, not as monolithic groups but as unique individuals. Ultimately, race relations are about individuals getting along with each other" (p. 194).

Payne argues that there is growing evidence that Americans are embracing this individual approach to race. Among other things, he cites the example of race relations in the military (a great success he thinks); the decline of racist attitudes among whites; the effect that large-scale immigration from Asia and Latin America is having on racial classifications and boundaries; generational replacement; and increasing interpersonal contacts across racial boundaries, including more interracial marriages and transracial adoptions. These changes Payne believes are resulting in a decline of racism and increasingly are making the very concept of race irrelevant.

Payne's argument is alluring but not persuasive. Americans are not divided by color because blacks and whites as individuals cannot get along. Rather, the race cleavage in the United States persists because of the persistence of a historically constructed set of systemic, structural, and institutional arrangements that systematically result in negative outcomes for blacks while advantaging whites. These systems of disadvantage are sustainable without the active or self-conscious participation of most whites. Until these arrangements are changed, it is not likely that any amount of interaction between individual blacks and whites, no matter how well intentioned, or even intimate, will fundamentally bridge America's racial divide. Indeed, a fair amount of research shows that whites with egalitarian racial attitudes and close black friends can nevertheless support structural and institutional arrangements that preserve their group's position of dominance and privilege.

Funding Science in America: Congress, Universities, and the Politics of the Academic Pork Barrel. By James D. Savage. New York: Cambridge University Press, 1999. 219p. \$49.95.

David M. Hart, Harvard University

Perhaps you have wondered, striding across your campus, why the new center for quantum computing is named for Senator Blowhard, who you know has never touched a keyboard in his life. Posing the question, of course, is tantamount to answering it: The good senator got your university president the money to build the center. Just like loyal alumni and friendly corporations, members of Congress routinely earn such gratitude these days. Yet, perhaps (being a card-carrying political scientist) you took the next step and wondered whether the local benefits of this center and all the others similarly named might impose a general cost on the nation, since the judgments of Senator Blowhard and his colleagues appear to have been substituted for those of experts who surely know their way around a keyboard better than their elected representatives. These questions, both obvious and subtle, animate James D. Savage's short, solid, and readable new monograph.

Savage skillfully narrates a series of episodes in which university presidents and members of Congress advocate and obtain (or object to and block) "academic earmarks." This history, which covers roughly the past two decades, is exhumed from the obscurity of private meetings and massive appropriations bills with the assistance of the public record, selected internal documents of the Association of American Universities (AAU) and a couple of its member schools, and about twenty interviews conducted while Savage served as a consultant on the issue to several congressional bodies in the early 1990s. The most illuminating chapter for this reader describes the emergence of lobbying firms that specialize in academic earmarking and their diffusion of this innovation from client to client. The ability of these operatives to identify legislative vehicles and construct networks of support for particular projects may not surprise readers of this journal, but Savage provides detailed examples that you will enjoy and from which your students will learn. Other chapters cover the deliberations of the AAU, the history of federal legislation to fund academic research facilities as an alternative to earmarking, congressional debates, and the role of the White House.

Savage does not flinch from naming names and making judgments. Table 3, for example, provides the amounts that AAU members received as a result of earmarks between fiscal 1980 and fiscal 1996 (Iowa State and Pittsburgh lead the list with more than \$100 million); tables 5 and 6 list the higher education clients of Cassidy and Associates and other lobbying firms. Although he lets its advocates make their case, often in their own words, Savage thinks academic earmarking is a bad practice. He calls the AAU to account for its failure to sanction members who ignored its resolutions to refrain from the practice, and he amply demonstrates hypocrisy among the membership.

The analysis backing up Savage's overall assessment of academic earmarking is convincing in some respects but not in others. Savage shows that earmarks are highly concentrated in the districts of legislators on the appropriations committees and so cannot generally redress the geographical inequities that conventional research funding allocation processes produce (although West Virginia benefits handsomely). He also shows that many institutions which already receive substantial federal research funding gain from earmarks as well; the practice does not appear to target institu-

tional inequities very effectively. On the key question of research quality, Savage's data reveal that some recipients of earmarks have risen substantially in the rankings of total federal research funding since the practice became widespread.

Earmarks that build capacity in growing fields of research, such as biomedical science, may permit institutions to go on to obtain peer reviewed grants. Savage stops short of drawing this conclusion, which is unpleasant to him, because he claims to be unable to produce a figure for peer reviewed research alone. (He might at least have subtracted the earmarks from the institutional total to yield a guess or, more ambitiously, done some statistical analysis or sought alternative output indicators, such as papers produced.) If this conclusion is warranted, however, academic earmarking is not necessarily as bad as Savage thinks. The history of academic medical centers since the 1950s bears out the point that talent sometimes follows money. I do not mean to defend the practice in general but to suggest that a more nuanced assessment is in order. This portion of the analysis also suffers from the dichotomy that Savage draws between earmarking and peer reviewed research funding programs. Other modes of allocation beside these two, including formula funding and relatively autonomous program management, deserve to be taken into account.

More generally, Savage's figures show that academic earmarking is simply not big enough in the larger scheme of federal research funding to make the difference that he seeks to find at the level of states or regions. Academic earmarks have never amounted to more than 7% of federal academic research funds, and half of these earmarks were made by the agriculture and defense appropriations subcommittees. (One discovers this fact very late [p. 126], long after Savage criticizes others for failing to make their definitions of academic earmarking clear.) The National Science Foundation and National Institutes of Health appropriations have remained remarkably clear of earmarks. The book, then, is haunted by the problem of the dog that did not bark, as Savage, to his credit, admits. I was persuaded that academic earmarking has the potential to do serious damage but not that it has yet done so. Savage is better at elucidating the motives of those who pursue academic earmarks than those who fail to seek them or those who oppose them, despite his ambition to explain all these motives (p. 3).

This weakness may stem from Savage's failure to engage effectively with the theoretical literature. He makes a promising stab at using an Olsonian framework to analyze the AAU, but he does not carry it all the way through. Other potentially useful connections (even the most logical one, to Linda Cohen and Roger Noll, Technology Pork Barrel, 1991) are simply passed over. The framework offered in chapter 1, using the work of Thomas Kuhn and Donald Searing, is but a gesture and virtually disappears in the rest of the work. My conclusion is that this book will be of intense interest to practitioners and analysts of academic research policy, will make worthwhile reading for specialists in science policy, and will appeal modestly to students of public policy and American politics in general.

The Sometime Connection: Public Opinion and Social Policy. By Elaine B. Sharp. Albany: State University of New York Press, 1999. 289p. \$17.95 paper.

Ted G. Jelen, University of Nevada, Las Vegas

The simple yet profound purpose of *The Sometime Connection* is to investigate, in broad strokes, the correspondence

between public opinion and public policy in American politics. In an ostensible democracy such as the United States, policy should, in principle, be guided by the preferences of mass publics. Using highly accessible materials, such as historical accounts of the policymaking process and descriptions of aggregate public opinion, Elaine Sharp investigates the opinion-policy connection over the past thirty years (longer in some cases) for six issues: crime and punishment, abortion, affirmative action, pornography, welfare, and social security.

Sharp is quite attentive to several sources of complication in her analysis. She is well versed in the literature concerning the quality of public opinion in mass publics, and she takes care to distinguish genuine attitudes from nonattitudes; she also is generally alert to possible changes in political context that can alter the interpretation of poll results. At first glance, one would think that nonattitudes would pose a nonproblem in these six issue domains, since all seem to correspond to the notion of "easy issues" (Edward G. Carmines and James A. Stimson, Issue Evolution: Race and the Transformation of American Politics, 1989) on which meaningful public opinion is cognitively nondemanding. Yet, Sharp demonstrates plausibly, if not entirely convincingly, that the quality of mass attitudes varies across the domain of these six social issues.

Even if there exists a relationship between mass attitudes on a particular issue and public policy toward that same subject, it does not follow that political elites are responsive to changes in public opinion. Indeed, it is possible that the causal arrow runs in the opposite direction, that mass preferences are the result of elite leadership (phrased positively) or manipulation (understood more pejoratively). Sharp argues quite convincingly that precisely such a sequence accounts for the dynamics (or, more accurately, the statics) of public attitudes toward social security.

Sharp does an excellent job of accounting for the complexity of various policy areas. For example, she suggests there are at least three components to attitudes and policy toward welfare: the amount of money expended on public assistance to the poor, work requirements for recipients of public assistance, and the "moral regulation" of welfare recipients. These components are, to a large extent, independent of one another, and Sharp provides a very clear and compelling analysis of each.

The model of opinion-policy interaction that Sharp regards as normatively preferable is one she terms the "thermostat" model, in which mass attitudes and government policies exert reciprocal influences. That is, government policy ideally should change in response to public opinion, and the demands of certain aspects of public attitudes (e.g., the suggestion that "too little" is being spent on a particular problem) should change as the result of government actions. Sharp's analysis reveals, however, that only in two of the six policy areas considered here—abortion and welfare—does the thermostat model seem to apply.

In the areas of crime and social security, Sharp argues that the model of a "broken thermostat" is most descriptively accurate. That is, policymakers appear responsive to public demands to "do more" to punish criminals or to "protect" Social Security, but aggregate public opinion does not appear responsive to changes in government policy. In both cases, Sharp suggests that this nonrelationship can be attributed to the actions of certain policymakers. In the case of imprisonment, Sharp argues that strategic political candidates often can make use of the "crime issue" (perhaps using anecdotal evidence) despite real declines in the crime rate. Since it is unlikely that crime will ever be completely eliminated, the public's fears can easily be exploited by seekers of elective

office. With respect to Social Security, Sharp argues that the program was initially oversold to the public in order to protect Social Security from the stigma of "welfare." Proponents have emphasized the insurance and universality features of the program to ensure broad public support. In an important sense, such leaders have done their work too well, as even the appearance of benefit reduction now occasions intense public reaction (although Sharp notes some recent, and quite understandable, generational differences on this issue).

In a bit of terminology I found confusing, Sharp characterizes the opinion-policy relationship on affirmative action as a "Downsian sequence" (a term borrowed from a 1993 book by Frank Baumgartner and Byran Jones). In a Downsian sequence, public policy is initially responsive to public opinion, but responsiveness decreases as entrenched elites assume responsibility for policy implementation. Thus, the widespread support for civil rights for African Americans that existed before 1964 did not include the possibility of "preferential treatment" for disadvantaged minorities, but aggressive (generally bureaucratic) efforts to equalize the economic status of the races continued in the face of widespread public opposition. Sharp attributes this sequence to the need for government bureaucracies (in this case, the Equal Employment Opportunity Commission) to produce tangible evidence of their effectiveness.

Finally, Sharp shows that public attitudes toward the regulation of pornography, despite apparent stability, exhibit certain characteristics of nonattitudes, that is, public opinion appears neither to cause changes in public policy nor to be affected by such changes. Similarly, public attitudes toward pornography appear serenely stable, despite large-scale shifts in activist rhetoric (from pornography as a moral issue to an issue essentially involving women's rights).

One of the most frustrating but intriguing aspects of The Sometime Connection is Sharp's inability to provide a general explanation for the patterns described. Why, after all, should we enjoy (or endure) democratic policymaking in some issue areas but not in others? Sharp shows that the structure of public opinion, the tangible and symbolic stakes posed by an issue, or the institutions that are charged with making public policy on different issues do not allow us to distinguish the 'thermostatic" issues of abortion and welfare from the others. For example, abortion appears to be an area in which public policy is quite responsive to public opinion (and vice versa), despite the fact that the federal courts have largely determined the limits within which federal and state governments may regulate the practice. Yet, the lack of a general explanation for the success of democratic policymaking in some areas, and its apparent failure in others, is no objection to Sharp's excellent book. The Sometime Connection seems likely to be an agenda-setting work that will provide the basis for innumerable articles and dissertations in the years to come. It is the first component of a continuing conversation, well begun but far from completed.

Choosing Justice: The Recruitment of State and Federal Judges. By Charles H. Sheldon and Linda S. Maule. Pullman, WA: Washington State University Press, 1997. 305p. \$35.00.

Susan B. Haire, University of Georgia

The role of the courts in the American political system places judges in a precarious position. Those sitting on the bench are expected to decide cases without being influenced by the political context, yet they may pay a heavy price if their

decisions depart substantially from the preferences of the majority. The extent to which judges' decision making reconciles these competing demands is often linked by scholars to judicial selection. Recruitment processes that are more democratic in nature, such as elections, are believed to contribute to accountability in the judiciary, whereas selection methods that are insulated from the voting public should maximize the potential for judicial independence. Yet, accountability seems tenuous in most elective systems because voters know very little about judicial candidates. Likewise, judicial independence may not be attainable in those appointive systems in which executives select close political allies to fill vacancies on the bench. Rather than abandon a scholarly pursuit of these sketchy connections between recruitment and decision making, Charles Sheldon and Linda Maule bravely sort out these relationships in Choosing Justice. As a result of their efforts, scholars now have available a conceptual framework with the potential to advance our understanding of selection processes and judicial roles.

Sheldon and Maule emphasize that it is not the method of selection per se that determines the connection to judicial accountability and independence. Instead, their central contention is that "judges who survive a high articulation (recruitment) process will tend to view their judicial role from a more balanced viewpoint where both accountability and independence shape that role. In contrast, a low articulation process will elevate ... [those who] ... assume roles nearer the extremes" (p. 30). To model this perspective, Sheldon and Maule begin by identifying the three-step sequence common to all recruitment systems: initiation of candidates, screening by formal and informal participants, and affirmation of those selected. Within each step, the authors suggest there is variation in the range, number, and effectiveness of participants. Furthermore, they argue that this variation ultimately determines whether the level of articulation for a selection method may be characterized as high or low. High articulation recruitment is marked by contested, competitive seats and high participation by a wide variety of actors throughout the process. The absence of these characteristics signals a low articulation recruitment. They find that some types of selection systems, such as nonpartisan elections, lead to a high articulation recruitment when formal and informal mechanisms encourage effective participation at each step. Sheldon and Maule also suggest that variation underlies each selection method type. For example, in states in which judges are appointed by the governor, a low articulation process may result if the governor relies on recommendations from a few close advisers. In contrast, a high articulation process will characterize recruitment if the governor consults with a variety of groups and individuals before making the appointment. Both types of states may share a similar judicial selection method, but the level of articulation varies as a result of the participants involved in recruitment.

As these examples illustrate, the appeal of the Sheldon and Maule approach lies in the effort to conceptualize judicial selection as a recruitment process rather than a classification that focuses on the means of affirmation for those selected. By adopting a broader view and using an articulation model, the authors recast our traditional understanding of judicial selection. For example, conventional wisdom suggests that judges will be responsive to the voters in contested partisan elections. Yet, Sheldon and Maule's analysis of the Texas recruitment process suggests the level of articulation is low, even in contested elections, because political parties dominate the initiation, screening, and affirmation stages. These judges may be accountable, but their responsiveness will be focused on the party faithful who contributed to their suc-

cessful election. Sheldon and Maule also broaden the scope of traditional approaches to the study of selection systems by emphasizing the importance of both formal and informal institutions in the recruitment process, particularly during the screening phase. It is not surprising that they find the organized legal profession to be an increasingly effective group of participants. Their analysis makes it clear that bar associations have worked to establish a screening role through their evaluations of potential candidates for vacancies in most judicial selection systems.

Sheldon and Maule also bring new insight into this line of research by including federal judicial systems in their analysis. At the Supreme Court level, they analyze the nomination of Ruth Bader Ginsburg to illustrate the applicability of the articulation model. They suggest a high articulation process characterized her nomination due to increased attention to Supreme Court nominations in recent years, the sensitivity of the Clinton administration to wide-ranging interests, and the concern for a confirmable candidate. The authors find that these dynamics contributed to the selection of a justice with a balanced perspective. Their analysis of federal judicial recruitment also uses the articulation model to illustrate differences across court levels. For example, participants involved in the recruitment of district court candidates are limited to a few actors, most notably home-state senators. In contrast, many more actors are involved in the selection of Court of Appeals candidates. The authors note the consequence of this difference: "Most district court candidates will not experience high articulation recruitment processes that will socialize them to appreciate the need to counterbalance the expectations of impartiality and independence against the demands of political and public accountability. Instead, they will go through low articulation experiences, where the few effective actors involved will either emphasize political accountability . . . or judicial impartiality" (p. 203).

Although the authors clearly establish the logic underlying a relationship between judicial recruitment and orientation, their work does not provide substantial empirical support for the premise. They rely heavily on the scholarly literature from the past three decades, particularly works published in the 1970s, that are suggestive but do not directly tackle their central thesis. Sheldon and Maule also provide case studies of individual states or, in the case of federal recruitment, individual jurists. These case studies are helpful in illustrating the concepts suggested by this approach. Perhaps the strongest support for their perspective can be found in the thorough analysis of Washington's nonpartisan election system (much of which is located in the appendix). After documenting the extensive involvement of a variety of groups in the screening process for Washington's judicial candidates, the authors gauge the effectiveness of these participants by using survey data on voters' sources of information in judicial races. In addition, they test for the critical link to judicial roles by surveying candidates' views toward accountability and independence, and they find some support for a relationship between candidates' perceptions of articulation levels and judicial roles.

Overall, Choosing Justice is an invaluable resource for scholars interested in judicial selection. In addition to the rich descriptive accounts of recruitment processes, this work provides an ambitious blueprint for future studies on selection systems, particularly those that will examine more directly the connections between levels of articulation and judicial roles. The opportunities for this line of empirical research should be plentiful, as there is variation across state and federal court systems as well as change over time in the

number and effectiveness of participants involved in recruitment processes for all courts.

Uncertain Guardians: The News Media as a Political Institution. By Bartholomew H. Sparrow. Baltimore: Johns Hopkins University Press, 1999. 277p. \$48.00 cloth, \$17.95 paper.

Kathleen Hall Jamieson, University of Pennsylvania

Bartholomew Sparrow rejects the "fourth estate" model for an open systems approach (p. 4) to the news media. This approach is predicated on the assumption that in the uncertain environment in which they operate the news media find stability in links to established actors, including advertisers, audiences, politicians, and governmental officials. In the process the large news organizations standardize the practices by which they cover national politics. They come to function, as the title suggests, as a political institution. All this is, of course, standard fare.

The value of *Uncertain Guardians* comes not in its originality but in the intelligence with which Sparrow has woven together his case and the insight inherent in the metaphors he marshals to organize his arguments. For example: "Institutions are often nested—existing on different, mutually compatible levels, like the Russian wooden dolls" (p. 132). Or: "The news media are an aggregate actor in the way that six aircraft flying in formation may be considered a distinct entity" (p. 133). Occasionally the impulse to employ the vivid metaphor translates into hyperbole, however. For example, Sparrow writes that "the media are not merely umpires but hanging judges" (p. 49).

The book's weakness resides in its tendency to overstep the evidence, its inattention to small but important details, its uncritical treatment of such topics as civic journalism, and its failure to integrate the Internet as a news source into its theoretical framework. The tendency to overstate is evident in such claims as "the news media often . . . violate their own ethical standards and, indeed, the norms of democratic government" (p. 5). The book does note the standard instances in which the news media violate their own ethical standards (e.g., the "accidental" gas tank explosion on Dateline [p. 128]) and, some would argue, the norms of democratic government (e.g., buying into the Bush administration's view of the Gulf War [pp. 141-4] and uncritically embracing the U.S. government's official account of the downing of KAL 007 [pp. 144-52]), but Sparrow fails to establish that such behaviors occur "often" or are typical or widespread.

There is a similar problem with the claim that "many network correspondents and news anchors—such as Brit Hume, Dan Rather, Sam Donaldson, and Ted Koppelroutinely engage in editorializing in ostensibly straight, on-air news stories" (p. 51). The footnoted documentation does not provide evidence to support "routinely." It also does not justify the additional comment that "Tom Brokaw, Bernard Shaw, Christine Amanpour, and others, to be sure, are much less ironic or sarcastic in their reporting" (p. 224). Although he calls for a more critical stance by reporters and citizens alike, Sparrow is guilty of a one-sided examination of civic journalism (pp. 190-6). He criticizes the critics of civic journalism for failing to explore the "serious issues" (p. 195) underlying its advocacy, but he fails to explore the serious issues raised by the critics themselves. Those who see it as a worrisome alternative deserve to have their reasons represented.

Also, the section titled "How the Business of News Affects Political Communication" should not inform readers that "it is clearly in the constitutional rights of publishers and broadcasters to choose only the ads they wish to carry" (p. 78). The courts have held that candidates for federal elective office have a right to access. "It is the purpose of the First Amendment," wrote the Court in the famous Red Lion case, "to preserve an uninhibited marketplace of ideas in which truth will ultimately prevail, rather than to countenance monopolization of that market, whether it be by the Government itself or a private licensee." Section 312(a)(7) added by Congress to FCC regulations in 1972 states: "The Commission may revoke any station license or construction permit for willful or repeated failure to allow reasonable access to or permit the purchase of reasonable amounts of time for the use of a broadcasting station by a legally qualified candidate for Federal elective office on behalf of his candidacy."

At times the claims of the book simply seem strange. Included in the fabrications for which the American news media are indicted is Bush's statement that the fact Clarence Thomas "is black and a minority has nothing to do with this sense that he is the best qualified at this time" (p. 193). Sparrow surely does not mean to imply that the press should have ignored a statement by the president about a nominee for the Supreme Court? Perhaps he does not believe that the press treated Bush's claim with sufficient skepticism? Yet, it is from press reports that the public learned about Thomas's limited experience, the reservations expressed by fellow lawyers about the appointment, and that Thomas had been the beneficiary of the sorts of affirmative action of which he disapproved.

At other points Sparrow finds fault with news decisions that I consider exemplary. In the chapter "The Watchdogs that Didn't Bark," he criticizes the news media for their "failure to report on fundamental issues of public health in their coverage of a Canadian biologist's . . . development of a cure for cancer" (p. 166). Although he recognizes that "Nacssens has not yet conducted the randomized, doubleblind, controlled experiments that would confirm his research to the scientific community" and has not "contributed to scholarly journals" (p. 168), Sparrow objects that "Naessens has not been mentioned in most of the leading U.S. media" (p. 169). As a result, he concludes that "the general welfare of the American public and the advancement of biological science and medicine have been neglected" (p. 174). The person who is neglecting the advancement of biological science and medicine is Naessens. If he has a cure, then he should demonstrate that fact in controlled experiments and publish the results in refereed medical journals. Until that is done, it would be irresponsible for the press to attach the word "cure" to his hypothesis or needlessly to raise the hopes of those with cancer.

With its focus on print, cable, and broadcast news, this is largely a book about the past not the future. By covering the Internet in a few concluding pages, Sparrow minimizes his ability to integrate this news source into a coherent theoretical framework. He notes that General Electric owns NBC but does not explore the extent to which its media practices are changed by its cable and Internet news joint venture with Microsoft, MSNBC, or by its role as controlling shareholder in the search site Snap.com, which is operated by NBCi. G.E. also holds a large stake in Value Vision International, a cable shopping channel. Given these entanglements, how fair and extensive was NBC's coverage of the government's recent actions against Microsoft or its reporting on the dispute between privacy advocates and business concerns about disclosures of individuals' banking transactions to other businesses? Have NBC's ties influenced its reporting on financial news? The questions extend beyond conflicts of

interest. Does NBC's control over auxiliary channels of communication increase the likelihood that such important democratic rituals as party conventions will be carried not on broadcast but on channels requiring subscription fees?

In sum, Uncertain Guardians wraps a synthesis of a wide body of research from political science and mass communication in a number of tantalizing metaphors in service of an argument that few will find controversial. What makes it a less than ideal text is its tendency to overstep the evidence, its lack of attention to small but significant details, its uncritical advocacy of a controversial alternative to traditional journalism, and its failure to integrate the Internet tightly into its analysis. Finally, the utility of the book for scholars would have been increased by the inclusion of a bibliography.

Campaign Finance in State Legislative Elections. Edited by Joel A. Thompson and Gary F. Moncrief. Washington, DC: Congressional Quarterly Books, 1998. 249p. \$47.95 cloth, \$28.95 paper.

Frank J. Sorauf, University of Minnesota

No serious scholar of American campaign finance or of American legislative elections should even consider ignoring this book. It reports a pathbreaking first study of the funding of legislative campaigns—for the lower houses only—in eighteen American states in the 1980s and 1990s. It is, in short, required reading.

A project of such scope has many parents. Thompson and Moncrief, in addition to overall responsibilities, write individually or jointly in five of the eleven chapters. Six additional authors write in various combinations in ten of the chapters. One of these, Malcolm Jewell, was the graduate teacher of Thompson and Moncrief as well as three other authors. The book is, therefore, testimony to his enormous influence, as scholar and teacher, on the study of American state politics.

The plan of attack is straightforward, touching all aspects of legislative campaign finance: the sources of the money, expenditure levels and trend lines, incumbent advantage and challenger poverty, the roles of PACs and party committees, the effect of money on election outcomes, and the financing success of women and minority candidates. The study does not, however, extend to attempts to relate campaign funding to outcomes in the legislatures themselves. The eighteen states are, not surprisingly, states with available data. Despite that constraint, they are reasonably representative with one exception: The South and Southwest, where many states lack full reporting requirements or agencies that collect and publish usable data, are underrepresented.

Clear, no-nonsense, monographic prose prevails throughout. There are few rhetorical flourishes, but there are no dense thickets to fight one's way through. Methods, procedures, data, and conclusions are lucidly set out, and readers are spared methodological diversions and self-indulgence. The focus is on the substance of the inquiry. The result is a book that will be accessible to serious undergraduates, all political scientists, and interested citizens—no matter how methodologically challenged.

Inevitably in a work of such complex collaboration there is some repetition and a few inconsistencies, but much less than one might expect from a book written by eight authors. The only substantial fall from grace is an index beset by style inconsistencies (first name or initial of authors?), some errors (e.g., missing page notations), and, most serious, the decision not to index author references within parentheses. That latter omission reduces the book's usefulness to scholars and, as

one wise editor once told me, surrenders a proven marketing device!

And what of the substance—the findings, the explanations, the theoretical contributions? Not unexpectedly, the study confirms much of what we have learned from the analysis of congressional campaign finance. State legislative incumbents greatly outspend their challengers; party committees are the only sources of money consistently committed to helping those challengers; and competitive elections, especially those with no incumbents running, boost the aggregate cost of the campaigns.

Yet, there are significant differences among the states in these and many other matters. Even leaving California aside—with 400,000 people in each of its Assembly districts, its campaigns are almost in the U.S. congressional league—there are substantial variations in sheer sums raised and spent, in the funding roles of party committees, and in the level of PAC activity, for example. Significantly, these and other differences appear to be related to the degree of legislative professionalism. The state legislatures that most approach the elaborate campaigning we associate with congressional campaigns are those with longer sessions, larger staffs, more perks, and longer incumbency. In them, presumably, the electoral prize to be won is greater, and the office itself nourishes the electoral support, group contacts, and skills for large-scale campaigns.

Beyond that pervasive finding, there are also bodies of fresh, new data. The chapter on the funding of campaigns in primaries provides one of the first comparative looks at a subject long impeded by lack of interest and severe data problems. Likewise, the chapter on the funding of minority candidates in the states—limited to California, Illinois, New Jersey, and Pennsylvania—advances work on that topic by confirming the funding problems minority candidates face in majority white, non-Hispanic districts.

If I have any reservations about the analysis, they center on the relative absence of institutional and legal variables. For example, regulatory provisions (e.g., contribution limits) do not appear as independent variables or controls. The state laws that permit direct corporate or labor contributions—without the necessity of forming PACs—do not modify conclusions about PAC contributions. Moreover, although there are explanatory references to public funding in Wisconsin and Minnesota, there is no systematic analysis of the effect of that funding. Granted that an N of two is daunting, there are important differences between the two programs, and they affect candidate financing in each state differently.

The concluding chapter, a summing up with implications for reform options, does what it sets out to do very well. But some of the summary is repetitive, and the observations on reform surprisingly ignore this decade's spate of campaign finance reform in the states. My own preference would have been for a conclusion more willing to get at some of the theoretical issues that emerge from the analysis, such as the implications of the importance of legislative professionalism. Do public offices create or shape the political cultures that determine their campaign finance, especially their level of spending? Anthony Gierzynski has in fact nicely presaged such a theoretical exploration with his second chapter.

Going first is always hard. The first extensive study of any aspect of the American states cannot tackle everything—what constitutes "everything" may not even be clear until after that first study. In this instance the authors have made a superb start at unraveling one of the great unknowns in state politics. To be sure, they have left projects for themselves and their successors to pursue, but much of the status quo and its explanations are now apparent. One hopes they

will, individually or collectively, press on. Others should not hesitate to join them.

American Virtues: Thomas Jefferson on the Character of a Free People. By Jean M. Yarbrough. Lawrence: University of Kansas Press, 1998. 256p. \$35.00.

Ralph Ketcham, Syracuse University

The mind of Thomas Jefferson, recorded in his voluminous writings and papers, is and has been, ever since he began taking notes on his studies and writing public and private papers before the American Revolution, the source of intense and stimulating interest to students of American thought and, indeed, for more than two centuries, to theorists and public figures around the world interested in democracy and self-government. Jefferson's eminent biographer, Dumas Malone, once remarked that what distinguished Jefferson and some other notable founders from most contemporary political leaders was that "they knew more about the past, and thought more about the future." It is the depth and richness of this thought and Yarbrough's learned, analytical, and incisive handling of it that make this book, even among the dozen or more volumes on Jefferson's ideas published in the last decade or so alone, a welcome addition to a crowded field.

The special merit of this book is its thorough, traditional search for and analytical treatment of Jefferson's philosophy. Yarbrough takes Jefferson's intellectual millieu straight: She uses terms much as he did, giving reality to such words as virtue, character, moral sense, republican, and even God. Thus, when Yarbrough discusses Jefferson's connection of civic virtue with the idea of self-government, she accepts that there can be some real meaning to the concept of civic virtue, and that one can discuss the questions of good government and self-government in ways intelligible and constructive to modern (and postmodern) students and political leaders alike. The reader does not have to push through presentminded political or legal critiques, or through repudiation of Jefferson's "metanarratives" or universals, or through twentieth-century psychologizing in order to find the eighteenthcentury thinker. His words, and a learned explanation of what his ideas were, are there, as first hand as is possible two centuries later. When Yarbrough explains that Jefferson "understands that the preservation of republicanism does not depend primarily on laws or mere institutional arrangements but on the spirit of a people nourished in the habits of self-government" (p. 135), that he "believes that republican families are essential to the formation of republican citizens and that women are the pillars of the republican family" (p. 132), and that he "anticipates Tocqueville's observation that local self-government helps mitigate the corrosive effects of commerce and radical individualism" (p. 138), we can engage directly with what Jefferson took to be "the character of a free people." The result is a searching, unapologetic exposition of Jefferson's views on human nature, on justice and the good society, and on the purpose of government, in the conventional language of political inquiry.

Yarbrough is able to perform this useful service, of course, because of her own deep understanding of 2,500 years of Western political thought and her skill in handling traditional concepts. She makes use of the commentaries of students of political ideas from Montesquieu and Tocqueville to Hannah Arendt and Paul Rahe, but even more, she is well-versed in the ancient, medieval, and modern thinkers themselves who constituted Jefferson's intellectual world. Yarbrough places Jefferson firmly in the school of Lord Kames and other

Scottish philosophers who emphasized, as Jefferson himself put it, that since "man was destined for society," he was given a "moral sense, or conscience..., a sense of right and wrong... as much a part of his nature as the sense of hearing, seeing, feeling" (to Peter Carr, August 10, 1787; quoted on pp. 34–5) Yarbrough sees that this more elaborates Jefferson's standing with his "trinity of immortals"—Francis Bacon, Isaac Newton, and John Locke—than separates him from them.

Jefferson was always the Enlightenment intellectual, confident in the sway of order, morality, and reason in the world and ready to apply these precepts to every aspect of life, character, and culture in the new nation whose independence he had declared in 1776. He believed, Yarbrough explains, that "the moral sense, acting together with unassisted human reason, can discover . . . moral sentiments [that] are natural and universal...All human beings, in every society, are motivated by feelings of sympathy, justice, gratitude, benevolence, and friendship" (p. 193). Jefferson did not believe, of course, that all people always displayed these qualities, or that a political majority could create them; rather, "they are inscribed in human nature by a Benevolent Creator so that human beings everywhere can develop the moral and intellectual capacity for self-government (p. 193). Whatever modern or postmodern critical analysis might make of such sentiments, Jefferson expressed them cogently and plausibly (and idealistically) for the first generation of American leaders and citizens. As Yarbrough points out, however, Jefferson's is a "moral vision" of the "shared principles of the political community,...completely foreign...to the 'expressive individualism' so characteristic of Thoreau, Emerson, and Whitman in America and of J.S. Mill in England" (p. 193).

In a volume that stands as the best exposition we have of Jefferson's thought, especially his political thought, one finds nonetheless some things to complain about. In acknowledging and explaining carefully Jefferson's deep classicism, especially his debt to Epicurius and the Roman moralists, for example, Yarbrough sees too much separation between the disinterested, self-sacrificial notion of citizenship of the ancients and Jefferson's own powerful, private-oriented inclination to avoid public office. This overlooks both the proforma, politically coy nature of Jefferson's professions of preference for farm, family, and friends (he never for long refused to return to public office and, indeed, often sought it for reasons as patriotic as those of Pericles himself) as well as his ready blending of private and public friendship. When he pointed out to James Madison "the friendship which has subsisted between us now half a century, and the harmony of our political principles and pursuits" (February 17, 1826; quoted on p. 172), he was asserting the merging in his own mind of the loyal, devoted, and unselfish qualities necessary to both private virtue (friendship) and public virtue (citizenship).

Yarbrough sees the rather formal, generally "public" nature of the huge correspondence between Jefferson and Madison, with its lack of "the warmth and affection so evident in the late correspondence with [John] Adams" (p. 173), as proof that the political ("partisan") nature of the connection between the two Virginians was separated in Jefferson's mind from the personal virtues of private friendship. Rather, the difference in tone between the two correspondences could easily be explained by the fact that after Jefferson returned from France he often saw Madison daily—when they were in public office in the same city or traveling together—and probably otherwise semiannually in their exchange of visits to country houses only twenty-five miles apart; there were lots of opportunities for intimate, private talk. The elderly Adams

and Jefferson, in contrast, knew they would never meet again and thus had to express everything in letters. On important

matters, however, Yarbrough generally gets Jefferson just right in this profound, integrating, and important book.

Comparative Politics

Taking the Wheel: Auto Parts Firms and the Political Economy of Industrialization in Brazil. By Caren Addis. University Park: Pennsylvania State University Press, 1999. 257p. \$47.50 cloth, \$18.95 paper.

Peter R. Kingstone, University of Connecticut

The third chapter of Taking the Wheel begins with an anecdote related to the author by a Brazilian auto parts producer. A circus ringmaster desperately tries to make an elephant cry, telling tale after tale of woe. The elephant remains dry-eyed until a man in the audience whispers something in its ear. As the elephant finally yields a tear, the stunned ringmaster asks the man what he said, to which he replies: "I told him that I was a supplier for Ford" (p. 91). The anecdote pertains to the breakdown of the initial cooperative relationship between multinational assemblers and largely Brazilian suppliers. It also stands as a metaphor for the whole relationship between the two sectors since at least the 1960s. Over the sectors' first four decades, supply relations suffered from frequent betrayals and recriminations, intense lobbying and trickery, as well as continuous adjustments, particularly within the parts sector. In fact, Addis's account makes it easy for students of the recent neoliberal reform process to understand the current Brazilian context of brutal supplier-assembler relations and rapid and profound rationalization of the parts sector.

Nevertheless, Addis also shows how domestic auto parts procedures were able to put their stamp on the evolution of auto production in Brazil. The key to Addis's argument is that Brazilian auto parts producers, whose existence predates the initiation of assembly in Brazil, were able to forge ties to policymakers and assemblers and thereby shape the path of development in Brazil. Initially, policymakers had little interest in inviting assemblers to locate in Brazil and had little confidence that local conditions were adequate for assembly. Multinational assemblers were equally skeptical of the possibility of effective production in Brazil's backward economy. Yet, parts producers persisted and, combined with the efforts of key bureaucrats, finally convinced President Juscelino Kubitschek to make a priority Brazil's "modernization" through domestic production of the automobile.

As a consequence, small, technologically unsophisticated parts producers were able to shape the assembly process according to their preferences. These preferences led to an initial period in which a "horizontal image" of production was implanted, one that entailed mentoring of the parts producers by assemblers and long-term stable contracts for production of relatively small volumes that were well below standard beliefs about minimum economies of scale. Yet, over time, that initial cooperative, horizontal image unraveled in the face of several constantly changing pressures. Policymakers' preferences shifted, especially with the installation of military rule in 1964. Key bureaucratic agencies, notably the Executive Group on the Automotive Industry, were weakened, which weakened the input of parts producers. Assemblers' preferences shifted as production took off, luring new players and intensifying the participation of existing assemblers. Finally, economic uncertainty and volatile macroeconomic conditions led to continuous shifts in both the bargaining positions and strength of all the players involved. This pattern of shifting preferences and economic circumstances led to a continuous adjustment in the parts sector.

Ultimately, the horizontal vision gave way to a different pattern, including substantial rationalization in the parts sector and the emergence of two tiers of producers. The top tier, composed of multinational parts producers and large Brazilian producers (typically in some kind of association with multinationals), produced for assemblers and accounted for most exports. The bottom tier, typically smaller and technologically unsophisticated firms, produced largely for the domestic after-market. Meanwhile, the assemblers increasingly were able to assert their strength and impose their preferences on the market. Long-term stable contracts grew scarce as assemblers played suppliers against one another. Assemblers used promises of export promotion to undermine rules that protected the domestic parts producers. Mentoring gave way to both increasing levels of vertical integration and increasing numbers of multinationals who produced parts locally. The horizontal image, however, remained alive to the extent that assemblers continued to produce limited numbers of multiple models and platforms. This forced them to rely on flexible production practices more typical of Japanese methods than of American Fordist principles.

Addis's purpose in tracing this history is to debunk the notions of large-scale industrialization advanced by such theorists as A.O. Hirschman ("A Generalized Linkage Approach to Development, with Special Reference to Staples," Economic Development and Cultural Change 25 [1977 Supplement]) and common in typical accounts of the development of the auto industry, such as Helen Shapiro, Engines of Growth (1994). Addis also notes that these typical conceptions of large-scale industrialization are common as well among Brazilian policymakers. Thus, she situates her account within a new, revisionist current that has identified critical roles for small players in shaping Brazilian history.

Addis's account is very thorough, original, and persuasive; it is hard to argue with either the quality of the evidence or the care of her argument. It is possible, however, to raise some objections, two of which stand out. First, the author's interest in demonstrating the role of small actors leads her perhaps to downplay the role of major players. It is true that the outcome in Brazil deviates from large-scale Fordist principles. Yet, it is also true that assemblers very rapidly seized the upper hand in bargaining over the shape of the sector and seemed repeatedly to impose their preferences on the production and policy process (examples of which abound in Addis's analysis, such as Ford's role in the creation of BEFIEX, pp. 122-3). Similarly, by the 1970s the key players in the auto parts sector are no longer "small" per se. As Addis notes, in terms of political, organizational, and economic influence, the key players were the largest domestic producers and the large number of multinational producers in the sector (pp. 163-8). Granted, Metal Leve was not General Motors, but neither Metal Leve nor Robert Bosch were "small" actors.

Second, the book perhaps undersells itself theoretically. Addis is very concerned with critiquing large-scale notions of

industrialization and providing a corrective to emphases on the assemblers and the belief in the backward linkages that derive from them. This is certainly interesting, but Addis does not tell us much about the larger implications of this for development or for the study of political economy. That is unfortunate, because the book demonstrates much more than simply the inadequacy of large-scale industrialization as a framework for understanding Brazilian development. This incredibly rich account demonstrates concretely how market outcomes emerge from a process of constant negotiation both among market actors as well as between market actors and the state. Thus, the logic driving the specific character of industrialization is not technologically determined but instead reflects an interaction between markets and politics and the historical choices that shape production as well as the subsequent political conflicts. One reason this is important is that it teaches a crucial lesson about the political economy of economic reform in this era of neoliberalism. Addis's work is a crucial reminder that the current process of adjustment at the micro level reflects past conflicts, and future outcomes depend on how conflicts are resolved today. Among the many riches inside her book, this lesson alone makes Taking the Wheel valuable to students of development and political economy.

Women on the Defensive: Living through Conservative Times. By Sylvia Bashevkin. Chicago: University of Chicago Press, 1998. 318p. \$47.50 cloth, \$18.00 paper.

Janet K. Boles. Marquette University

Although contemporary feminism has been strongest in the Western industrial democracies, with their tradition of liberal civil rights, virtually every nation now has some type of women's movement. The literature suggests that U.S. feminism, with its professional interest groups at the national level and more activist local social movement groups, has greater adaptability to pursue multiple goals and shift priorities as needed. By this reasoning, U.S. feminists should have been insulated by a congressional system and a strategy of political independence from the challenge posed by the Reagan-Bush administrations.

Bashevkin successfully challenges this assumption of the greater success of U.S. feminism by presenting a comparative analysis of the women's movements of Canada, Great Britain, and the United States under Brian Mulroney, Margaret Thatcher, John Major, Ronald Reagan, and George Bush. Drawing upon interviews with more than 100 feminist activists and experts in the three countries (and their primary materials), she systematically traces the outcomes of national legislative and judicial decisions in five policy areas of concern to all movements: equal rights, family law, reproduction, violence, and employment. In each case she compares the success rate of women before the first conservative government took office with that during conservative rule. Although all three movements suffered setbacks, Canadian women best surmounted the conservative challenge; U.S. women took the harshest hits.

This study fills a significant gap in the social movement literature that is primarily focused on the origins of movements. Here is a look at three mature movements at a time when progress is typically slower and opposition greater and within the context of remarkably similar political opportunity structures. All three conservative governing regimes embraced a common idealogy of reduced government, antiwelfare, individual initiative, personal responsibility, family values, social conservatism, free trade, and devolution. For the

three movements, this required a paradigm shift from their premise on a positive role for government and reliance on bureaucracy, regulation, and intervention.

Women in all three nations lost economic ground in wages, jobs, and welfare; feminists were marginalized, isolated from their former allies, and stripped of their government advocacy appropriations and clientele agencies. But there were successes as well, and these are attributed to the intersection of ideas and institutions. U.S. feminists were disadvantaged by two presidents (with strong vetos) who deeply believed in conservative social policy that permeated all branches of government and the Washington, D.C., community, by a strong antifeminist movement, by the lack of constitutional equal rights protection, and by a more politicized judiciary. British feminists could draw upon supportive European Court of Justice rulings on employment and an autonomous judiciary. Likewise, Canadian feminists could rely upon a Mulroney government committed to free trade and indifferent to social policy, constitutional equal rights and affirmative action provisions, employment policy dominated by the provinces, and judicial holdovers from the Trudeau era.

Those who use either the political opportunity structure or resource mobilization perspectives on social movements are provided with a convincing refutation of the ascendancy of U.S. feminism, but Bashevkin provides no encompassing theory of women's movements and their life-cycles or predicted successes as a replacement. Instead, her many findings and observations will resonate with scholars as highly suggestive for middle-range theory. For example, the multiple-crack access points of federalism (and a state-focused organizational structure) appear to have served U.S. and Canadian feminists well in maintaining past victories. The U.S. tradition of private giving insulated women by filling their coffers to unprecedented levels. It is also possible that an equal rights feminism is better situated to withstand economic conservatism. In all three nations, membership in feminist groups rose, public opinion support grew, and more women entered elected office and the cabinet.

The study further contributes to the current dialogue on globalization. Bashevkin suggests that we may be witnessing the globalization of economics, politics, and feminism as Democrats, Liberals, and Labourites campaign from the Left, govern from the Right, converge toward the opposition party and the center, and assume the "permanent campaign" mode of U.S. parties. As a result, through 1997, few real policy achievements for women have occurred with the defeat of conservatism beyond a softer, gentler political rhetoric. In turn, British feminists have converged toward the pragmatic reformist U.S. model by lobbying more, contesting elective office, and courting media coverage. Canadian feminists have added protest to their range of strategies. All recognize that neither protest nor officeholding is sufficient for women's political incorporation.

In summary, this pathbreaking book is certain to stimulate debate and further research by scholars in several fields: social movements, comparative politics, and women's studies.

The Gorbachev Factor. By Archie Brown. Oxford: Oxford University Press, 1997. 406p. \$16.95 paper.

John P. Willerton, University of Arizona

Nearly ten years after the collapse of the USSR, judgments about both Mikhail Gorbachev's intentions and the consequences of his six-year tenure as Soviet leader are extremely varied. The previous enthusiasm and generally positive readings of his policy efforts have given way to mixed—and

occasionally quite negative—assessments of his reform legacy. Rejected by most in his native Russia, Gorbachev has become a symbol for an era of unfulfilled dreams and widespread regrets. Today, as Russia is mired in the complex and often tedious challenges of post-Soviet economic transformation, Archie Brown provides a needed reminder of the tensions, excitement, and high drama of the fast-paced perestroika years. Exhaustive and carefully grounded in an impressive diversity of sources (with more than 70 pages of detailed notes and supporting documentation), this volume provides an analysis that will prove to be among the most definitive when future students of politics turn to the final years of the Soviet system.

Reactions to Brown's volume are certain to vary considerably among interested observers. The core thesis—that Gorbachev was seriously interested in political change and economic reform but came to understand that reform was not enough and that the political system would have to be transformed—will provoke a range of reactions. Brown, however, has long studied Gorbachev, and the case he makes that Gorbachev was an important positive factor in the transformation of Soviet Russia is compelling. The author may well be sympathetic to Gorbachev's intentions and efforts, but his analysis is straightforward and must be considered by any serious student of the late Soviet period in Russian politics.

Brown effectively places Gorbachev in the context of a complex constellation of Soviet institutions, rules, and politicians. The policy dilemmas increasingly evident in the Brezhnev era greatly influenced Gorbachev's perspectives as he ascended into the upper echelons of the Soviet leadership. Brown demonstrates that these serious reformist inclinations were already apparent by 1984, before Gorbachev became general secretary. Yet, Brown presents a Gorbachev who was savvy in his own career building, who was effective in navigating the tricky waters of building alliances while expanding his own power base. He also presents a Gorbachev who was very effective in manipulating the official ideology to legitimate profound change in all major policy domains. The resultant analysis is thus multifaceted. Brown ties Gorbachevian reformism to Gorbachev's past and his own preferences, but that reformism is also tied to the team of allies and advisers who were cultivated by Gorbachev and to ideological developments that were contoured to legitimate his reformist agenda. Thus, the "Gorbachev factor" far transcends a single individual, as it reflects the influence of an evolving cohort of elites and a dynamic and changing institutional and policy environment.

Brown appropriately organizes the 1985-91 reform efforts into four major policy domains: the political system, the economy, foreign policy, and nationalities. He is especially detailed and effective in describing the domestic political reforms and changes in foreign policy ("new thinking") at the heart of Gorbachev's positive legacy. Brown's study makes clear that the most profound step taken by Gorbachev in transforming the USSR was to introduce the concept of contested secret ballot elections to a new legislature. Publicly proposed in June 1998 and applied less than a year later, this and related political changes fundamentally altered the functioning of the party-state system, made political elites and the Communist Party more accountable, and permitted the already more open public debate to widen and increasingly structure decision making. Meanwhile, foreign policy innovations permitted a fundamental change in Soviet Russia's international position, and the resultant diminishing of external obligations facilitated a more serious consideration of profound domestic economic reform.

Brown is less detailed in dealing with the economic and nationalities dilemmas, but he acknowledges both the system constraints and mistakes in Gorbachev's calculations that precluded policy success. Gorbachev's underestimation of the nationalities conundrum, his retreat from the so-called 500 days economic reform program, and his turn to the conservative right in 1990–91 are among the major miscalculations of the Soviet leader discussed in the volume. Brown emphasizes both the intractability of some policy areas (e.g., the nationalities question) and the effect of confounding bureaucratic obstacles in other areas (e.g., implementation of rootand-branch economic reform).

In assessing the intent, direction, and pace of Gorbachevian policies, different observers can offer alternative interpretations, and reactions to Brown's analysis and conclusions will vary. Some could emphasize limitations in Gorbachev's thinking or a lack of will on his part to apply more fundamental policy changes. I am inclined to agree with Brown. Similar to Brown, I would emphasize the powerful institutional realities within which Gorbachev was operating as he struggled to retain power while promoting his reform agenda. But this is largely a matter of interpretation, and one can appreciate that others would weight the array of explanatory factors—including the Gorbachev factor—differently and draw alternative conclusions.

Our understanding of the developments that led to the collapse of the USSR and Soviet bloc and the transformation of Russia will continue to evolve, and scholarly interpretations are likely to remain very divided. All observers, however, will need to address the role and influence of Mikhail Gorbachev as this profound set of events unfolded, and in doing so a reading of Brown's important study will be a necessary requirement.

Subversive Institutions: The Design and the Destruction of Socialism and the State. By Valerie Bunce. Cambridge: Cambridge University Press, 1999. 206p. \$54.95 cloth, \$19.95 paper.

Postsocialist Pathways: Transforming Politics and Property in East Central Europe. By David Stark and László Bruszt. Cambridge: Cambridge University Press, 1998. 284p. \$55.95 cloth, \$22.95 paper.

Michael Bernhard, Pennsylvania State University

These are two of the most important books on developments in Europe east of the Elbe since 1989. Both are based on deep knowledge of the region and are grounded solidly in contemporary social science theory. Most significantly, both present interesting new theories about what has transpired or is transpiring in postcommunist Europe.

Subversive Institutions explains the destruction of communist regimes, the unraveling of the Soviet block, and disintegration of the multinational states in the region as a product of the pathological design of communist institutions. What is positively pathbreaking about the book is the way in which it weaves together two heretofore disparate strands of the literature on postcommunist political development. Almost all other theories of the communist collapse have seen the disintegration of regime and state as different processes with different causes. Bunce's great innovation is to explain both with reference to the same independent variable, the design of Soviet-type institutions.

Bunce's argument is structured around a series of interrelated questions. First, why did Soviet-type socialism collapse? Why did the Soviet bloc as a whole collapse? Why did three multinational socialist states—the USSR, Yugoslavia, and

Czecho-Slovakia—also disintegrate as states? And why was the disintegration in Yugoslavia so violent in contrast to the other two cases? Bunce explains all this with reference to two independent variables: Soviet-type institutions and changes in the political opportunity structures within socialist societies, or what she provocatively describes as "subversive institutions interacting with subversive opportunities" (p. 88). The method she uses is historical institutionalism, with a series of small-n comparisons providing the basis for logical inference.

Bunce begins the discussion of institutions with an assessment of socialism in its Stalinist incarnation. In this phase, the state was strong, society was weak, and the mobilization economy generated robust growth. Over time, these relationships changed—the state weakened, society strengthened, and the economy began to perform poorly. In brief, although I do not do justice to the subtlety of Bunce's argument, the major reason for this was the replacement of coercion as the primary means of control with economic incentives. This transferred resources away from the center, divided the elite along functional lines, and both homogenized and empowered society. Communist leaders faced an increasingly discomforting critical choice: Reform the system (potentially undermining socialism) or attempt to placate constituencies in society by economic means while the economy was in decline.

In addition to these institutional changes, a confluence of developments in the 1980s brought about a radical change in the political opportunity structure throughout the bloc. There were (1) succession struggles in the Soviet Union and several other states; (2) the embarkation of the USSR on a program of great reforms under Gorbachev (by no means an inevitable outcome) and the political struggles that accompanied this in all European socialist states; and (3) changes in the international environment (specifically, the changed climate on human rights caused by the Helsinki process and the opening of East European economics to the world economy as a substitute for economic reform). All these worked further to empower society and fragment the regime.

Bunce also uses institutional analysis to understand why certain multinational states in the region disintegrated but others did not. She considers a number of theories and finds that comparison of the three cases leaves all of them wanting as comprehensive explanations. This discussion leaves her with one necessary condition for disintegration (national minorities located in concentrated geographic areas), but the answer to this question is also institutional. What these three states shared and no other in the region had was a federal structure.

Federalism contributed to the disintegration of states in three ways. First, it promoted national consciousness by encouraging the construction of nations (e.g., certain forms of national consciousness were encouraged under socialism—Moldovan, Macedonian, Belarusan), while other more established nationalisms were reinforced (Slovakian, Baltic, Croatian, Serbian). Second, the existence of republican institutions provided the basis for nascent states as well as resources for nationalist challengers to the center. Third, the state itself was highly dependent on the regime and its central structures. The party was the glue that held the federations together; when the party disintegrated, so did the state itself.

The final question Bunce addresses is why Yugoslavia disintegrated so violently. She compares the institutions of federalism there with those in Czecho-Slovakia and the USSR. First, Yugoslavia was exceptional in that it was the most decentralized of the federations, and this promoted an unusually contentious relationship among the republics even

under socialism. Second, whereas the Czecho-Slovak and Soviet militaries remained quiescent and subject to civilian control despite regime and state collapse, the Yugoslav National Army had long been an important actor in domestic politics and saw itself as "the guardian of socialism and the state" (p. 121). Third, in Yugoslavia, the dominant republic, Serbia, was in a politically weak position within the federation yet had powerful institutional resources at its disposal. Thus, it had grievances against the other republics and the means to pursue them. In the USSR and Czecho-Slovakia, the dominant nationalities, the Russians and Czechs, held the preponderant political position in the federation, yet they did not have independent institutional resources (neither Russia nor the Czech lands had republic-level institutions like Slovakia or the fourteen other Soviet republics).

Postsocialist Pathways, a collaboration of American economic sociologist David Stark and Hungarian political scientist László Bruszt, presents a highly original theory of the economic and political transformation of East Central Europe. The book is most strongly focused on Hungary, which Stark and Bruszt know best, but uses Poland, the Czech Republic, Slovakia, and East Germany as foils for comparative analysis. The first part of the book is a brief pathdependent comparison of the extrication from communism of Poland and Hungary. Along with the work of Rudolf Tokés, Hungary's Negotiated Revolution (1996), and Patrick O'Neil, Revolution from Within (1998), this section is one of the rare theoretically informed and empirically accurate accounts of the transition in Hungary. Despite the strength of this section, it is the second and third sections of the book, on the economic transformation, that represent the most unique contribution.

This study establishes Stark and Bruszt as two of the most trenchant critics of both neoliberal market-utopian theories of economic transformation and neostatist critics who advocate a strong, sometimes even authoritarian, developmental state. They reject the notion that there are ready-made recipes for moving from Soviet-type economic systems to capitalist market systems either on the basis of a neat neoclassical model or by copying the practices of the East Asian NICs. Instead, they argue forcefully that successful transformations must be based on the reconfiguration of economic elements already present, rather than on "building from scratch." These assumptions allow them to develop a much more path-dependent account of economic reform.

Their account also rejects zero-sum thinking on questions of markets versus states (either strong markets or a strong state, but not both). Instead, the authors argue that successful transformation requires both strong markets and a strong state. They also make the case that capitalist transformation should proceed institutionally from a point of strength. The most significant asset they identify in this regard are networks of interdependence (ownership, debt, supply), which distribute the uncertainties of transformation across firms. On the basis of some very persistent and imaginative fieldwork, they present several examples of this sort of networking in Hungary and the Czech Republic.

Proceeding from networks, however, will not necessarily guarantee success. Building on Peter Evans's work, Embedded Autonomy (1995), Stark and Bruszt maintain that network restructuring needs to be embedded in wideranging processes of social deliberation, so that reformers have access to the sort of information necessary for a successful transformation. They demonstrate the painful consequences of acting according to fixed notions of reform without consultation by

a comparison of the Hungarian, East German, and Czech processes of reform. They show how the doctrinaire implementation of reform in Hungary (the bankruptcy law) and East Germany (rapid opening of the economy) created severe, and unnecessary, economic shocks. In the Hungarian case this led to a rapid see-sawing back toward state intervention with concomitant strains put on the state budget. In East Germany, the state bureaucrats responsible for privatization, in concert with local politicians, came to recognize the network properties of the economy and avoided outright disaster.

The most curious of the cases is the Czech. Stark and Bruszt show that, despite Vaclav Klaus's free-market rhetoric, the Czechs have moved most cautiously, recognizing the interdependence of firms in their economy. They highlight the lack of a strong executive as an essential part of the more deliberative nature of Czech practice. This stands in strong contrast to the many observers who identify concentrated executive power as central to successful reform. Critics of their approach will, undoubtedly, point out the Polish case as one in which more cookbook-type approaches to transformation have worked. In this sense, the absence of an accounting of the Polish case is unfortunate, because Stark and Bruszt probably have a different view.

One weakness of Postsocialist Pathways is no consideration of the broader ramifications of transformation in property relations. Clearly, these processes have critical implications for such issues as the distribution of economic resources and political power in the new democracies of Central Europe. Furthermore, in all countries the issue of nomenklatura privatization is embedded in issues of social justice, coming to terms with the past, and even the legitimacy of the transformation of the last ten years. Because of this, the last chapter, "Extended Accountability," can sound a bit utopian at points.

Subversive Institutions and Postsocialist Pathways both demonstrate that a detailed knowledge of place is an excellent starting point for creating powerful social science theory. Both works go about it in different ways. Bunce proceeds from a broad knowledge of a moderate number of cases, compares them, and derives a causal theory of an historical event (the collapse of communism) to enhance our understanding of several contentious issues in social science, such as revolution, nationalism, the role of institutions, and the place of area in the practice of comparative politics. Stark and Bruszt take a much more microlevel approach to deflate widely held but substantially inaccurate impressions of what economic reform in East Central Europe has entailed. In doing so, they create or elaborate social science concepts that allow us to better understand this process (e.g., transformation, networks, deliberative association).

Comparative Public Policy: Patterns of Post-War Transformation. By Francis G. Castles. Cheltenham, UK, and Northampton, MA: Edward Elgar, 1998. 352p. \$53.00 cloth, \$22.95 paper.

Martin Rhodes, European University Institute

This is a magisterial study by a leading international specialist in public policy research. The approach is simultaneously comparative, interdisciplinary, and wide-ranging. Castles provides a "comprehensive account of post-war public policy development in the OECD region based on a systematic analysis of data covering more than 30 years for 21 nations and 12 policy areas." Moreover, three different audiences are targeted: those with no statistical training who are uninterested in numerical analysis, those with no statistical training

but who want to understand the techniques employed, and those with considerable background. Castles seeks to make the analysis accessible to the first two groups while not disappointing the third. He also wants to dispel some of the myths that loom large in both politics and academia, particularly the globalization bogey of the Left and the "big state" demon of the Right. Altogether this is a tall order. How well does he succeed?

Overall, Castles does extremely well. With regard to accessibility, much of chapter 1 is devoted to explaining the approach taken in the book, and it provides a useful map for exploring subsequent chapters and a basic introduction to data analysis. Set out with admirable clarity is the author's justification of his comparative and interdisciplinary approach; the rationale for his presentation of data; and the utility of invoking four "families of nations"—English-speaking, Nordic, continental Western, and southern European. Castles then explains that the statistical analysis is only an entry point for understanding the many factors shaping policy outcomes and postwar public policy development.

Chapters 2 and 3 review the major factors identified as significant for postwar public policy development, presenting the author's interpretation of the sociological ("modernization") and "politics matters" approaches. Castles begins by noting the blindness of both approaches to history and then guides the reader through the effects of postwar economic growth, covering changes in occupational structure, urbanization, and aging. Trade and religion are introduced as potentially important variables neglected by modernization theory. Chapter 3 departs from the latter completely by stressing the significance of ideology and institutions for cross-national patterns of public policy outcomes.

These two chapters provide a thorough account of the intellectual context and introduce the author's own brand of the "politics matters" school. At the end of chapter 3 is a useful summary of his "fractured modernity" thesis. In essence, this argues that there are fracture lines between "alternative routes to and through modernity." The most radical fractures of all, Castles maintains, are the result of partisan differences. These not only show no signs of convergence, he argues (indirectly countering "end of ideology" assumptions), but also are unconnected to the main socioeconomic cleavages of the postwar era (p. 95).

Chapters 4 to 8 are the meat of the book and provide the bulk of analysis on which this judgement is based. Each follows the same format: description of the data, development of key hypotheses, presentation of findings, and the final analysis, backed up by bivariate test tables that illustrate the size of correlations for each variable over time. The causes of big government, the welfare state, the state and the labor market, public policy, and "the personal" (i.e., home ownership, fertility, and divorce) are all analyzed in this way. The conclusions clarify our understanding of postwar developments. High government outlays and receipts are linked to minimal veto points, weak right-wing parties, and population aging; high levels of public consumption spending are associated strongly with Left incumbency. The effect of international trade on both is minimal. Social security spending in the early postwar period was determined by citizen needs, cultural patterns (particularly Catholicism), and the availability of economic resources; in the more recent period, politics—both partisan and constitutional—"matters" most. Public health coverage presents a mirror image: Left incumbency mattered most early on, but resource availability had become an overriding influence by the 1990s. In education, political and social variables combine: Spending grows least in countries with Catholic cultures and Right incumbency.

As for the labor market, Catholicism has a strong influence on male and female labor force participation (as does home ownership on male withdrawal), while corporatism and strong manufacturing sectors were until recently guarantors of low unemployment rates. Contrary to right-wing assumptions, there appear to be no direct links between benefit generosity or the size of the state and unemployment, although the latter is positively linked to the rate of real earnings growth. Finally, in the analysis of domestic and family life, Castles shows that corporatism and Christian Democratic incumbency are major factors in the emergence of comprehensive state housing policies; that far from undermining the family, state benefits and high rates of female labor market participation are positively linked with fertility; and that lack of public support for families and the constraints on working women of Catholic culture conspire to defer family formation. High rates of divorce occur in non-Catholic countries, especially the English-speaking world, where services employment and female labor force participation combine with relatively recent legal reform. Contrary to popular opinion, the "nanny state" influence is negligible in these low welfare-spending countries.

The concluding chapter explores more fully the author's fractured modernity thesis. The broad picture is one of variable routes toward a threshold of affluence, prior to which resources and needs consideration heavily determine policy patterns, but after which partisan politics and ideology have freer reign. Convergence in outcomes over the whole postwar period is now culminating in a plateauing of OECD public expenditure development. According to Castles, the best explanation for this is neither the modernization nor the

globalization thesis but program maturation.

This is a compelling and convincing analysis. In its combination of scope, ambition, and rigor it is currently unchallenged. It is succinct, concise, and undeviating from its central explanatory thesis. The book also is extremely dense, especially in the central chapters. This is its one weakness, the consequence of packing in such a large amount of data and analysis, and may deter all but the most assiduous advanced students. Yet, given the penchant of many academics for ungrounded generalization, it should be compulsory reading for their professors.

Saudi Arabia and the Politics of Dissent. By Mamoun Fandy. New York: St. Martin's, 1999. 272p. \$45.00.

Gawdat Bahgat, Indiana University of Pennsylvania

This work deals with political stability in one of the most important countries in the world. The focus is on Islamic opposition to the Saudi political system. The book seeks to discuss the social roots and political ideas of the leading opposition figures in the kingdom since the early 1990s. In the first chapter Fandy presents the main concepts and the framework of his study. The following two chapters examine the ideas of two prominent Sunni Muslin clerics—Sheikh Safar al-Hawali and Sheikh Salman al-Auda. In their sermons the two preachers strongly criticized public corruption and nepotism as well as the American military presence in Saudi Arabia. In chapter 4, the analysis shifts to a more organized form of opposition—the Committee for the Defense of Legitimate Rights (CDLR) founded by Muhammed al-Mas'ari. The CDLR, headquartered in London, depends on fax machines, e-mails, web sites, and other means of modern communication to mobilize public opinion inside

and outside Saudi Arabia against the royal family. In the mid-1990s, the leadership of the CDLR split, and a new organization, the Movement for the Islamic Reform in Arabia (MIRA), emerged. The leader of MIRA is Sa'd al-Faqih, a surgeon by profession.

Usama bin Laden, the most outspoken Saudi dissident, is the focus of chapter 6. The main differences between bin Laden and the other opposition leaders discussed in this work are the final objective and the means applied to achieve it. With the exception of bin Laden, all the opposition figures and organizations mentioned by Fandy can be described as a "loyal opposition." Their goal is reform not revolution. They do not call for the overthrow of the royal family. Bin Laden, in contrast, has crossed this line and seeks to change the government in Riyadh. In order to achieve this goal he declared a holy war against the Saudi political system and the foreign power behind it (i.e., the United States). The last opposition organization discussed in the book is the Shi'a Reform Movement. Unlike all the other groups, this one is Shi'a. Its goal is to fight discrimination and prejudice alleged to be practiced by the Sunni establishment against the Shi'a minority. The leader of this movement is Sheikh Hassan al-Saffar.

In its efforts to contain the opposition the Saudi authority has adopted a stick and carrot approach. Both Sheikh Hawali and Sheikh Auda were imprisoned in 1994 and released in June 1999. Bin Laden was stripped of Saudi citizenship. Meanwhile, economic and social conditions have improved in the Eastern Province, where the majority of Shi'is reside. Another way for the government to contain the opposition has been an attempt to control the mass media both inside and outside the kingdom. Aside from government control over local radio, television, and newspapers, Saudi princes and their business allies have purchased major international media outlets. Furthermore, there is severe lack of coordination among opposition groups, who do not trust one another. Finally, oil revenues serve as safety valves for the royal family. Fandy concludes that the opposition groups do not pose a serious threat, and the political system in Riyadh is stable now and in the foreseeable future.

The major strength of this book is its reliance on primary sources, including tapes, books, and personal interviews. Collecting information on dissidents in Saudi Arabia is not easy. Still, the book has several flaws. First, to some extent the discussion tends to be more descriptive and less analytical. Each case study (i.e., opposition movement) stands on its own without a serious attempt to compare them or find similarities and differences. Second, the author does not adequately discuss previous work done on political opposition in Saudi Arabia. Several studies have dealt with this important subject. Some of them were cited, but no real efforts are made to benefit from their analysis and build on their findings. Third, Fandy claims that the Saudi opposition movement rose in reaction to external developments, particularly in Egypt, Syria, Iraq, and Iran. There is no doubt that regional and international changes have affected the socioeconomic and political environment in Riyadh, but internal problems within the system are also responsible for the rise of indigenous opposition. Fourth, the author suggests that when Crown Prince Abdullah succeeds King Fahd the Saudi political system will be more stable. It is true that physically the crown prince is in better shape than his brother and has strong ties with powerful constituenices within Saudi society, but given his age (about 75 years), it is hard to imagine that he will live long enough to have a long-term effect on the political system.

Finally, an important theme of this book is the rising role

of information technology in shaping the Saudi political environment. In 1999 the kingdom was connected to the Internet. In order to filter out material that the authorities consider undesirable, a government-appointed body became the node through which all web sites are accessed. Using technology imported from abroad, the King Abdulaziz Institute for Science and Technology in Riyadh has installed a system that prevents end-users from viewing pornographic, politically sensitive, or fanatically religious material. The ultimate arbiter on what is permissible is the Ministry of Interior. How this new opening to the global information system will affect the dynamics of Saudi policy is an open question.

Shrinking the State: The Political Underpinnings of Privatization. By Harvey Feigenbaum, Jeffrey Henig, and Chris Hamnett. Cambridge: Cambridge University Press, 1998. 182p. \$54.95 cloth, \$18.95 paper.

William Gormley, Jr., Georgetown University

To policy analysts, what is most interesting about privatization is its consequences; to political scientists, the political origins of privatization are of greater interest. Although Shrinking the State offers little new material to resolve the pressing questions posed by policy analysts (does it work? when does it work? for whom does it work?), it contributes significantly to our understanding of privatization as a political phenomenon.

The central thesis is that privatization is rooted not in economics but in politics, particularly the motives and designs of leading politicians. The authors develop this thesis by examining the evolution of privatization in three settings, the United Kingdom, France, and the United States. In each country, national politicians link the rhetoric of privatization to ideological or partisan goals. Their underlying motivation is not the quest for economic efficiency but the quest for a smaller welfare state or a larger victory in the next election.

The authors substantiate their argument by immersing themselves in the nuances of each case. For example, they note that France's candidates for privatization were already profitable and efficient and that the United Kingdom sometimes substituted a private monopoly for a public monopoly. If economic efficiency were the real motivation, the authors argue, then these countries' conservative leaders would have privatized fewer assets and moved at a more deliberate pace.

To understand both cross-national and longitudinal variations, the authors introduce a typology rooted in a political understanding of privatization. Systemic privatization is an attempt to shrink the welfare state by privatizing large assets as rapidly as possible. Tactical privatization is an attempt to gain an electoral advantage by privatizing at an opportune time. Pragmatic privatization is an attempt to solve a particular problem through a tailor-made solution, such as contracting out. The first two forms are intensely political, and the third is not.

The story line in each country is strikingly different. In Britain, pragmatic privatization led to systemic privatization, which eventually triggered a backlash. In France, pragmatic privatization yielded to tactical privatization, which later mutated into a different version of pragmatic privatization. In the United States, pragmatic privatization never quite evolved into something else. Instead, pragmatic initiatives were coopted by advocates of systemic change, who ultimately settled for more modest reforms.

Each story is well told and well documented, with insights gleaned from the scholarly literature and the popular press.

The U.S. case is more difficult to characterize than the other two, perhaps because it involves a federal system, with more of a "bottom-up" approach to policy innovation. The authors concede an apolitical cast to numerous local government decisions to privatize through contracting out, but they argue that the broader concept of privatization was politicized by the Reagan administration, with important consequences for the future of privatization debates in the United States. They attribute Reagan's privatization failures to the ill-fated evolution of his plan to privatize public lands, a proposal that tainted other efforts.

There is much to admire in this book. It is theoretically informed, and it systematically applies a useful and original analytic framework. It provides rich, textured stories of privatization in three important countries and uses these to test four hypotheses. For example, the authors demonstrate that systemic privatization is favored by conservative governments and that certain forms of privatization generate backlash. It is easy to imagine this book being used to good advantage in advanced courses in comparative politics or public policy.

Still, several questions remain. First, is privatization a trend or a fad? The authors assert, convincingly, that it is not inevitable and that each nation's domestic politics will determine the issue. But are conditions generally favorable for privatization? In John Kingdon's words (Agendas, Alternatives, and Public Policy, 1984), have the problem, politics, and policy streams converged? If so, how long will a window of opportunity remain open for policy entrepreneurs?

Second, is privatization good or bad? The authors do not squarely address this question, although their asides suggest a jaundiced view. Numerous empirical studies have assessed the consequences of privatization for economic efficiency, but few examine the consequences for service quality or benefit redistribution. With privatization advancing in new policy areas (e.g., child support enforcement), we need more and better studies of the effects to inform and guide policymakers.

Third, is pragmatic privatization the wave of the future? Although the systemic and tactical forms have generated backlash, pragmatic privatization marches on. That is perhaps because it is rooted in nonpartisan policy analysis and decisions made by state and local bureaucrats rather than federal politicians. Such rationales are likely to prove more durable than ideological or partisan perspectives.

Finally, if pragmatic privatization is most likely to triumph, then where does this leave the authors' argument concerning the primacy of politics? By their own admission, pragmatic privatization is largely apolitical. If the perspective of political science helps us understand the choices national politicians made during the late twentieth century, then the perspective of policy analysis may help us understand the choices that officials at all levels of government will make in years to come.

Pornography and Democratization: Legislating Obscenity in Post-Communist Russia. By Paul W. Goldschmidt. Boulder, CO: Westview, 1999. 274p. \$55.00.

Peter Rutland, Wesleyan University

One of the first signs that censorship was easing in the former Soviet Union was the appearance in 1987–88 of young men selling home-made pornography at the entrance to metro stations, usually photocopies of crude erotic drawings. Printed color magazines and bootleg videos soon followed, and the rest, as it were, is history. The Soviet state simply lost its ability to control society. A vivid illustration was the fact

that the censor (Glavlıt) was still complaining in 1990 that its budget was insufficient to provide it with VCRs to monitor videos, which by then were showing in video salons in every Russian high street (p. 146).

Goldschmidt starts from the premise that a state's attitude toward pornography is a key indicator of its degree of tolerance, which in turn is an essential prerequisite for liberal democracy. He argues that the open circulation of pornography in Russia (on a scale far greater than in most other countries) does not mean that the Russian state, or society in general, has reached the level of tolerance required for a civil society. On the contrary, the dissemination of pornography is often regarded with disgust, as a sign of social breakdown and moral decay.

Despite the social upheavals that accompanied the rise and collapse of communism, traditional attitudes toward gender roles did not undergo radical change, Goldschmidt argues. Women are the losers in this situation: The state dominates men, and men dominate women (p. 240). Hence, the laissez-faire pornotopia that has blossomed since 1991 has led to a potentially explosive combination of traditional values of female subordination and postmodernist pornographic experimentation (p. 237). Russian liberals are divided over the issue, with their distaste for censorship overriding their differing opinions on the merits of pornography. Given this situation, Goldschmidt fears that conservatives, who oppose pornography on traditional moral grounds, are likely to win the argument and shape the future course of state policy.

One of Goldschmidt's central themes is that Russian intellectuals are partly to blame for this state of affairs. Rather than line up on the side of tolerance and pluralism, they tend to agree with the state that people need to be protected from their own worst instincts. Even Westernoriented thinkers, the bearers of liberal values, share the Russian intelligentsia's traditional suspicion of the people. Hence, one sees the extraordinarily prominent role allocated to "expert" commissions by Russian courts in deciding whether a publication is obscene. These experts rely on whatever discipline takes their fancy—from cinematography to psychology—as the basis for their judgment (p. 186). One of Goldschmidt's key informants is Vladimir Borev, an art historian who wrote the expert guidelines later adopted by the Procurator's Office (p. 175). We are told that Borev made his archive at the Video-ASS magazine available to the author (p. vii). (ASS is a Russian acronym, not derived from its Western synonym.) Borev has since given up reviewing pornography and is working as an "image maker" for former general Aleksander Lebed (p. 182).

A second central theme of the book is that of historical continuity. In fact, despite the title, only about one-third of the text is devoted to Russia since 1991, and at least one-third is given over to the tsarist era. Goldschmidt argues that the Soviet state, like its tsarist predecessor, was primarily interested in control over the dissemination of potentially damaging material and was not at all interested in trying to define exactly what qualifies as pornography. The wording of the legislation dealing with obscenity was lifted almost verbatim from an international convention devoted to the subject in Paris in 1910—and the wording was only introduced into Soviet law in 1935, as a condition of the Soviet Union's entry into the USSR League of Nations (p. 169). The clause in question (Article 242 of the current Criminal Code) criminalized the distribution but not the possession of pornographic material.

The book, like its subject, promises somewhat more than it can deliver. It contains some fascinating insights, but the structure of argument is rather disjointed, weaving back and

forth between present and past. It does not provide a systematic account of the spread of pornography since 1991 (this story is mostly compressed into pp. 64-72). Important aspects, such as the role of the mafia, are only mentioned in passing (p. 195). Goldschmidt relies on a handful of informants (albeit influential ones) to represent intellectual opinion. He devotes relatively little space to analyzing the legislative process since 1991 (pp. 146-54), and he glides quickly over the broader issue of press freedom in Yeltsın's Russia. The adoption of new pornography legislation was still in process (in 1998) when the book went to press (p. 153). The author takes as a case study the 1996 civil suit against Playboy for printing obscene drawings of Catherine the Great and other luminaries (chap. 7). The suit failed, illustrating (to me) that it is premature to adopt a law-based approach to the phenomenon of pornography in Russia.

The book is primarily structured around philosophical and legal concepts, in particular the dialectic between conservative and critical thinkers on pornography (chap. 1). This distinction comes from the West and does not really fit what is happening in Russia, a point that Goldschmidt himself is at pains to underline. He is sympathetic to the anticensorship feminist wing of the critical school, and he advocates sex education as a way to deal with the problem (chap. 8), although not with any great conviction that this will work. Perhaps a conceptual framework more rooted in Russian experience—based on an analysis of gender roles, the nature (and absence) of privacy, or the curious way in which the public/private dichotomy plays out in Russian society—could have been more fruitful.

All in the Family: Absolutism, Revolution, and Democracy in the Middle Eastern Monarchies. By Michael Herb. Albany: State University of New York Press, 1999. 352p. \$49.50.

Pete W. Moore, Concordia University

An observer of the Gulf states once quipped that studying the region's monarchical politics is akin to watching television without sound. Michael Herb pursues this difficult issue by launching a multicase, comparative project with a clear theoretical target. His aim is to place the political institution of the monarchy as the key variable that explains the resilience or overthrow of monarchical regimes, not only among the Gulf states but also across the Middle East. Herb's foil is rentier theory, a fiscal sociology of the state that argues the character of a state's revenue determines a country's basic politics. This is an impressive, thought-provoking book of comparative scholarship that advances debate about the rentier state to fruitful grounds. Yet, those who believe rentier theory explains more than Herb is willing to grant (this reviewer being one) still have grounds to challenge some of the book's claims.

Herb argues that the Arab monarchies of the Gulf have succeeded in fashioning enduring political rule through intrafamily cohesion, which he terms "dynastic monarchy." The primary cases that serve as examples for the other Gulf monarchies are Kuwait and Saudi Arabia. In each case, ruling families established their predominance in the period immediately before and after decolonization. Keys to the endurance of this domination were the ruling family's control of the most important government ministries and intrafamily resolution of succession issues. The distribution of government posts among family members ensured that political rivals could not gain a bureaucratic foothold, and the internal resolution of disputes limited the exploitation of family

divisions. To varying degrees, the monarchies in Bahrain, Oman, Qatar, and the United Arab Emirates have emulated this design.

Variation in the dependent variable comes with a discussion of the failed monarchies in Libya and Afghanistan. According to Herb, the failure to establish dynastic control led to their overthrow. The key comparative leverage for the Libyan case is that the 1969 overthrow occurred despite the presence of high oil rents. Demonstrating impressive breadth for a first book, Herb goes on to discuss the fate of other nondynastic regimes in the Middle East (Egypt, Iran, Iraq, Jordan, and Morocco). Herb's handling of these deviant cases settles on two claims. First, for the overthrown monarchies in the first three cases, the lack of a dynastic character made monarchical rule more precarious, and thus challenges eventually overcame the poor decisions of rulers. Second, Herb attempts to explain the resilience of the nondynastic Jordanian and Moroccan monarchies by highlighting contingent and idiosyncratic factors that have meant regime survival but not endurance. These are hard cases to square with the book's thesis, but by not shying away from the contrary evidence, Herb enriches the theoretical debate.

All in the Family joins the work of scholars (Eva Bellin, Steven Heydemann, Miriam Lowi, and Gwynn Okruhlik) who challenge the assumptions and predictions of rentier theory. An important component under frequent attack is the distinction made between externally and internally derived revenue and the political implications that are expected. In the latter, political representation follows taxation. In the former, the state is aloof and unconstrained by representation demands. Herb's counter is that the arrival or decline of rents only signals change, but to understand variation in political outcomes, one needs to consider domestic political institutions. This is clearly an agency claim against the structural determinism of rentier theory. Monarchies survive, liberalize, or fall because of the decisions of monarchs, not because of the abundance or lack of exogenous rent. To this point, the argument does not stray far from recent revisions to the basic theory that explore the importance of a number of nonrent variables to postrentier outcomes. Yet, Herb flies a bit close to the sun in asserting that oil by itself explains nothing and is best understood as "an intervening variable" (p. 241)

In the linchpin Kuwaiti case, Herb argues the dynastic pattern was set in the wake of the proparliament Majlis movement in 1938. It was not until the 1950s, however, that a "dynastic proto-cabinet" (p. 76) was formed, with al-Sabah family members dominating state agencies. Timing is crucial, for by the 1950s Kuwait was flooded with oil monies, and it is precisely the presence of those external funds that allowed dynastic formation. Jill Crystal's influential treatment (Oil and Politics in the Gulf, 1995) of this period notes that oil rents allowed the emir first to establish regular revenue distribution among family members and then to coopt merchant elites. The 1961 dispute between merchants and the emir over Kuwait's first cabinet (a crucial event only briefly mentioned in the book) clearly demonstrated merchant abandonment of cabinet positions in exchange for distribution. The particular form of dispute resolution and bandwagoning Herb documents can be understood once one recognizes that the prospect of ever-increasing rent makes royals risk avoident; therefore, sharing the pie ensures intrafamily compromise. In the contrasting case of Libya, timing was also important. No doubt, from 1963 to 1969 the Sanusi monarchy made bad political decisions, but Dirk Vandewalle (Libya since Independence: Oil and State-Building, 1998) argues, in part, that these bad decisions were amplified by institutional destruction wrought by a massive influx of capital. Similarly, Jordan was born a rentier state (albeit in the form of foreign aid) but has a surviving nondynastic monarchy. Apart from idiosyncratic reasons for survival, the presence of those rents allowed the Hashemite state to employ half the country's workforce and coopt much of the business elite. These incentives played an important role in the Hashemite victory in the 1970 civil war. In all this, however, Herb is right that there is plenty of room for agency mistakes, but nevertheless the structural constraints of a rentier state are quite evident.

All in the Family imparts very useful lessons that further the debate about the legacies of rent and postrentier politics. This debate is not abstract theorizing. The Gulf states are currently crawling out of their own oil bust, and over the next decade, more rentier states will be created as some of the Caspian States receive their own oil windfalls. Oil revenue and its effects will be with us for some time.

The Individual and the State in China. Edited by Brian Hook. Oxford and New York: Clarendon, Oxford University Press, 1996. 231p. \$23.00 paper.

Mass Politics in the People's Republic: State and Society in Contemporary China. By Alan P. L. Liu. Boulder, CO: Westview, 1996. 251p. \$65.00 cloth, \$19.95 paper.

Stanley Rosen, University of Southern California

Although both of these volumes appeared in 1996, the influence of the events of the late 1980s, which culminated in the military crackdown of June 4, 1989, continues to weigh heavily on the authors. This is not surprising in the case of the book edited by Brian Hook, since most of the chapters originally appeared as a special issue of China Quarterly, published in September 1991. There appears to have been relatively little updating, although two of the authors provide brief postscripts that essentially reaffirm their earlier conclusions. What is new for the book is the Introduction (by Brian Hook) and, of particular value, a typically thoughtful concluding chapter on the dynamics of civil society in post-Mao China by the late Gordon White. Since both books were published before the death of paramount leader Deng Xiaoping in February 1997, a sense of uncertainty with regard to China's future leadership also permeates the two volumes.

There is a good deal of similarity between these books, at least in terms of the questions addressed. The Hook volume brings together leading specialists to analyze the relationship between various social groups and the state: Andrew Walder on workers and managers, Robert Ash on peasants, David Shambaugh on soldiers, Michel Bonnin and Yves Chevrier on intellectuals, and Thomas Gold on youth. Lucian Pye provides the overview interpretation. Alan Liu's book also examines the relationship between social groups and the state, and it contains separate chapters on peasants, workers, students, and ethnic minorities. These groups constitute Chinese "public opinion," and Liu attempts to demonstrate that public opinion, as the concept is generally understood in the West, has existed in the People's Republic since its inception in 1949.

The books are most closely linked, however, by their concluding chapters, both of which assess the prospects for the development of civil society in China. This became a common theme in works by Western academics after the unexpected events of 1989. Writing several years on, both Alan Liu and Gordon White recognize the importance of the Chinese leadership in any political transition. Influenced by the consequences of 1989, Liu suggests that China is far more likely to follow the economy-centered, nonconfrontational,

elite-centered Hungarian model, also followed in Taiwan, than the bottom-up Polish model. White, noting the fears provoked by and the conflicts inherent in China's incipient civil society, sees a growing consensus in China for a gradual, managed process of political liberalization and democratization. If such a transition can be achieved at all, it will have to be sponsored and organized by reformist elements within the current political elite.

Each volume is a serious contribution to an understanding of state-society relations in China and offers rewards to the careful reader. Liu not only is cognizant of the primary and secondary source literature on China but also is well versed in the theoretical literature on public opinion and civil society. Scholars engaged in comparative analysis that incorporates nondemocratic systems should find persuasive his reasons for rejecting the more restrictive definitions of public opinion provided by Hans Speier and Jürgen Habermas in favor of the broader usage employed by such writers as Bernard Berelson and Ithiel de Sola Pool.

Although of necessity oversimplified, Liu's key argument can be summed up as follows. There has been uninstitutionalized public opinion in the PRC since the 1950s. The total effect of the Communist Party's political revolution since 1949 has been a sharpening of the state-society division. The Chinese masses still harbored a degree of positive, wishful thinking toward the party until the anti-rightist movement of 1958. From then on they adopted various modes of amorphous social actions to oppose the party-state. As a result of dealings with the party-state, a mass political culture emerged among Chinese peasants, workers, students, and ethnic minorities. "Occasionalism" and "sectionalism" mark this political culture, so that every group or person will try to maximize its (or his/her) short-term interest when a specific occasion allows it, and every group will deal with the state independently of other groups (p. 224).

This approach yields some useful insights, such as Liu's analysis of how the social isolation of students and intellectuals has enabled the state to dispose of them as it saw fit. Liu is also well aware of the ironies of government policy toward the various groups, and he offers an interesting contrast between the treatment and response of workers and peasants. The peasants, despite official rhetoric, were treated by the state as conservative and reactionary, and therefore they were excluded from the "construction of socialism." In response to their "intolerable" treatment, they became the leading force for change and modernization in the post-Mao period. The workers, as the "true proletariat," were expected to spearhead the socialist transformation of China, but their "privileged" status under Mao turned them into a conservative force that resisted the Dengist state's modernizing programs (p. 130).

Liu's volume is marked by a broad historical sweep, covering the PRC since its founding in 1949. This allows him to make thoughtful and provocative comparisons of Maoist and Dengist China in each chapter. In the end, however, he does not see any "fundamental difference" in the state's conception of the individual between the Mao and Deng regimes (p. 230). Hook's collection, written by individual specialists, is more nuanced in this regard. Liu offers a coherent theoretical framework to link his chapters rather than the set of essentially discrete chapters one finds in Hook, but the detailed analyses provided in the latter volume reveal important, if perhaps not fundamental, changes as one moves from Maoist to Dengist China.

As with Liu, none of Hook's specialists appear to be overly optimistic about the success of the Chinese leadership's reform program in solving various problems. Lucian Pye sees

a post-Tiananmen state seeking to mask a paralysis created by factional differences. The result is a movement away from its Leninist traditions and a reversion to a traditional and highly ritualized Confucian state that seeks to uphold stability at all costs. Walder focuses most directly on the political crisis of 1989 and concludes that the participation of workers in these events signaled the unraveling of the Dengist strategy for reform (p. 68). He expects the political relevance of urban labor to grow. Ash offers a narrow focus, examining the changing nature and direction of key financial and real resource flows between the peasant and the state from 1979 to 1988. He concludes that tensions between the peasant and the state, exacerbated by the agricultural stagnation of the second half of the 1980s, will not be easily resolved. Shambaugh, who looks at 1989 in the context of earlier and later events, offers as his central argument that the People's Liberation Army and Communist Party elite are interlocking, symbiotic entities. Taking issue with those who argue that the army is a professional military that wishes to disengage from the political arena, Shambaugh expects that the military, if called upon once again to defend the party-state, will again obev.

Bonnin and Chevrier, who provide a detailed account of nascent civil society development, are the most optimistic of the authors. They examine the rise of limited "intellectual autonomy" in the 1980s and conclude that the Tiananmen crisis was a significant step in the emergence of civil society from the bleak landscape of totalitarianism, albeit just a step (p. 173). Gold, who uses the life course approach of sociology, examines the three birth cohorts that have passed through the youth stage since the founding of the PRC and reveals how each has had radically different relations with the party-state. He explores the very different views of these cohorts regarding the nature of China, socialism, the world, and themselves. This wide gap between generations has made it extremely difficult to integrate Chinese society and virtually impossible for the state to reestablish the type of control it exercised in the 1950s.

How well do these volumes hold up? Both are valuable, particularly for the light they shed on the first decade of reform. The chapters by Pye, Shambaugh, Gold, and White are less time bound and offer theoretical insights that can still be used to analyze current and future developments.

Militant Nationalism: Between Movement and Party in Ireland and the Basque Country. By Cynthia L. Irvin. Minneapolis: University of Minnesota Press, 1999. 281p. \$49.95 cloth, \$19.95 paper.

Andrea Grove, University of Vermont

In this ninth volume in the Social Movements, Protest, and Contention Series from the University of Minnesota Press, Cynthia Irvin takes on a question that has often puzzled researchers of both social movements and nationalist movements: How can we understand why groups traditionally mobilize to take violent action then change strategies and begin to engage in institutionalized politics? Because militant nationalism is built around the idea that the state and its political system are illegitimate, it is indeed a puzzle when paramilitary organizations such as the IRA in Ireland and ETA in Spain develop an electoral strategy that involves participation in the regime's parliamentary politics (which may or may not involve renouncing violence; Irvin refers to the latter as a "mixed" strategy). In addition to offering a plausible answer to this puzzle, Irvin begins to deal with a question that is crucially important today: How do external

actors affect the internal politics of nationalist groups? This review summarizes how the author addresses both issues and draws attention to several policy implications of her study.

The majority of studies on paramilitary groups focus on why they resort to violence, but Irvin recognizes in this comparison of the Irish and Basque cases that understanding the move from violence to "playing by the rules of the game" is indispensable. Such knowledge offers insight into the best way to get extremist groups to the negotiating table. Because her data are gathered from interviews (for both cases) and surveys (for the Basque case only), Irvin makes a significant empirical contributions to the study of revolutionary movements. For obvious reasons, it is rare for anyone to observe this particular kind of organization, but the perceptions of these actors are crucial to understanding their behavior in changing contexts.

As a launching point, Irvin conceptualizes revolutionary movements not in the traditional way, "as coherent systems of relations oriented to the pursuit of specific goals," but "as an opportunistic collection of divergent interest groups, temporarily banded together to pursue goals that are developed through internal political discourse" (p. 13). She argues that the strategies chosen by the organization are the result of the bargaining among three "interest groups": ideologues, radicals, and politicos. Ideologues predominantly advocate armed struggle, politicos argue for electoral participation, and radicals wish to pursue a mixed strategy. Irvin then explores the degree to which three factors drawn from social movements theory-regime responsiveness, competitive environment (absence or presence of competing political groups willing to cooperate with the government), and organizational resources (both domestic and international) affect the internal balance of power among these three

Specifically, Irvin hypothesizes that the three factors interact to (1) affect the size and influence of ideologues, radicals, and politicos and (2) set the context within which they choose among the following strategies: terrorism, armed struggle, mass nonviolent direct action, and/or institutional politics (p. 25). The reader is initially puzzled about the dependent variable. Is it the choice of strategy, as the introduction and literature review indicate, or is it the relative size of the three groups of activists? It would have been helpful to include a diagram of the many variables, which could show that group size and influence are intervening variables, and strategy choice is the phenomenon to be explained.

In chapter 2 Irvin elaborates on the three groups and their preferred types of activism, then derives three hypotheses about the effects of the independent variables. A fourth hypothesis, which seems unnecessary, states that these movements will choose strategies that maximize support for the military wing as well as the organization's goals. A minor problem is that these are not stated in hypothesis form-if, then statements—but instead are declarative statements. In discussing the hypothesized relationships, Irvin draws on theoretical work to make logical assumptions about the effects of structural variables (regime responsiveness, organizational resources, and competition from other parties) on the perceptions of activists. For example, hypothesis 1 states: "In semirepressive regimes characterized by intermediate levels of negative sanctions, nationalist movements will primarily attract militant activists, both ideologues and radicals, who will opt for a strategy of violent confrontation with the regime" (p. 38). The logic is that activists see repression as closing off any chance for their fair treatment in the institutions of the state and thus perceive violence as the best option. Because Irvin has data that allow her to assess the perceptions of activists, she is better able to study the relationship between repression and militant strategies than most other researchers who have tried. Indeed, she does a wonderful job of drawing on excerpts from the interviews and internal party documents to show the activists' perceptions about regime responsiveness and the other variables. Previous work has tended to rely on assumptions about how structure affects the perceptions of the actors.

Chapters 3 and 4 provide historical background for the decisions by the IRA and ETA to support Sinn Fein's and Herri Batasnuna's decisions to engage in electoral politics. Chapter 5 presents empirical information showing the "splits in the ranks," or the distribution among the three groups of activists in each case. Finally, chapter 6 contains the comparative analysis that links the three independent variables to the changes in composition and strategy of Sinn Fein and Herri Batasuna. Again, Irvin makes good use of the interviews she conducted in Ireland and the Basque country. Also, an engaging and informative narrative shows how shifts in regime repression, the competitive environment (such as the influence of more inclusive, nonviolent nationalist parties), and organizational support affected these movements. The research confirms her hypotheses.

As noted above, this study is significant because the unique data enable the author to get at the mechanisms operating between the behavior of actors external to the organization (such as more moderate parties, the state, and international actors) and the perceptions of activists who are trying to choose strategies in response to this environment. Several of the findings have implications for policy. For example, by showing how the responsiveness of the regime can affect whether more exclusive (ideologues) or more inclusive (politicos) activists enter the organization and have their preferred strategy "win," Irvin offers governments insight about the behavior that would provide the best chances for politicos to dominate. Another example stems from the fact that external actors can affect the parties' perceptions of the resources they bring to bear in the struggle. A comparison of an organization's resource "profile" before it is willing to enter electoral politics with the profile afterward suggests how external actors can try to manipulate the resources available to the organization in order to give the upper hand to the politicos.

On a theoretical point, Irvin's profiles of activists she shows socioeconomic data and pathways to activism of ideologues, radicals, and politicos—speak to recent research on identity and mobilization. Most work looks at "public opinion" support for different leaders as a whole. This study reveals that militants differ from other constituent groups in their society, and certain characteristics are associated with people who are more likely to take an exclusive view of the group's identity and mission. Therefore, scholars who agree that it is important to consider the conditions under which an extremist approach is likely to gather a public following need to pay careful attention to the profile of that public. Furthermore, because the independent variables in Irvin's model can be manipulated by actors outside the organization, lessons are offered on how to make that particularly "vulnerable" constituency less open to extremist appeals. For example, governments should think twice about strict security policies that target poor and working class areas because such repression tends to mobilize ideologues into revolutionary organizations and weaken the more moderate voice of politicos.

This book should be of interest to a broad cross-section of political scientists and social movement theorists, including those who are interested in the different kinds of mobilization

(toward more inclusive and more exclusive ends), conflict resolution, and organizational behavior. Indeed, this comparative analysis offers insight that is backed up by unique empirical work.

Contested Economic Institutions: The Politics of Macroeconomics and Wage Bargaining in Advanced Democracies. By Torben Iversen. Cambridge: Cambridge University Press, 1999. 221p. \$54.95 cloth, \$19.95 paper.

Herman M. Schwartz, University of Virginia

Torben Iversen generalizes, elaborates, and quantifies propositions about the sustainability of social democratic political economics that Fritz Scharpf first aired in Crisis and Choice in European Social Democracy (1991). Iversen's book challenges conventional new classical and neocorporatist literatures that look one-sidedly at the macroeconomic consequences of combining accommodating or nonaccommodating monetary policy with relative degrees of centralization in collective bargaining institutions, respectively, by observing what happens from different combinations of these institutional variables. Contrary to new classical models, which hold that monetary policy has no real long-term effects on unemployment and income levels, Iversen argues that monetary policy does have real effects. Contrary to neocorporatist arguments, particularly the widely accepted model of Lars Calmfors and John Driffell ("Centralization of Wage Bargaining," Economic Policy 6 [April 1988]: 14-61), which hold that only either highly centralized or decentralized collective bargaining systems produce superior macroeconomic outcomes, Iversen argues that in the current global economic environment a combination of nonaccommodating monetary policy and intermediate levels of centralization can produce superior outcomes. Iversen thus contests the notion that the only policy choice available today is between the disorganized and inegalitarian capitalism of the liberal market economies and the deficit-producing and egalitarian traditional social-democratic model.

Iversen tests these propositions by correlating institutional structures (understood as the combination of accommodating or nonaccommodating monetary regimes with high, low, and intermediately centralized collective bargaining systems) with macroeconomic outcomes across most of the rich OECD economies. He finds that, as the Calmfors-Driffell model suggests, the combination of accommodation and high centralization does produce low unemployment and wage inequality, but the combination of nonaccommodation and intermediate centralization produces all this and lower inflation, too. Iversen then models the underlying strategic behaviors by governments and unions that produce these two best-case outcomes. Qualitatively inclined readers need not fear Iversen's formal modeling and econometric exercises. He presents his findings clearly in each chapter and segregates the nuts and bolts of the models and formulas into appendices at the end of each chapter.

Iversen's findings matter for two reasons. First, the external environment that permitted the accommodation/high centralization combination to work no longer exists. Technological change has made wage compression difficult for unions and undesirable for the employers of skilled labor, but centralization almost always produces compression. The financial penalties for accommodation are also much higher in a world of relatively more mobile capital. Second, because actors are free to redesign imperfect institutions at the margins, and substantially freer to alter their strategic behavior within a given institutional structure, Iversen predicts that

actors will shift from the accommodation/centralization structure toward nonaccommodation/intermediate centralization. In practical terms, this implies a shift toward a policy regime such as Germany's. Iversen's case studies of Sweden and Denmark show this evolution. Case studies of Austria and Norway show how Austria's lack of wage compression permits the unusual combination of nonaccommodation and centralization and how Norway's oil boom created pressures for centralization that countervailed continued tendencies toward decentralization. Iversen thus believes that social democracy is sustainable, but only with a nonaccommodating/intermediately centralized institutional format. Practically speaking, this presents social democrats with the choice between employment and wage equality that Scharpf (1991) identified.

Iversen builds on Scharpf's game-theoretic analysis of similar dilemmas in post-oil shock Europe, but he makes a clear advance in two respects. First, the imperatives posed and incentives offered by the global economic environment after ten years of financial liberalization and the diffusion of information technologies to manufacturing are much clearer. Iversen thus can make a more reasoned exploration and model of the microfoundations for worker and thus union behavior with regard to wage compression, and how that in turn relates to employer strategies. Second, Iversen confirms statistically Scharpf's discursive findings.

In other respects Iversen's analysis is a move sideways. Other intermediately centralized economies neighboring Iversen's northern Europe cases also experienced decentralization from their intermediately centralized position during the 1980s and 1990s. It would have been interesting to explore the degree to which these economies were able to continue to balance among employment, inflation, and equality and whether the decentralization of collective bargaining was as much a strategic choice there as it was in the Scandinavian social democracies that shifted away from the accommodation/centralization configuration. As well, the pervasiveness of decentralization of collective bargaining suggests that the environment facing northern Europe is itself still in flux. Insofar as the relative optimality of a given institutional configuration is a function of its fit with its environment, continued decentralization elsewhere changes the environment facing countries that recently generated a nonaccommodating, intermediately centralized structure. The optimality of that structure may be transient. Iversen himself recognizes that the reorientation of bargaining around German wage gains in a more unified Europe may change the logic she presents, particularly as unions are not centralized at a European level and continue to decentralize outside Germany.

That aside, this is a good, clear book that accomplishes all it sets out to do. Dare I say that, like most Danish products, it is spare, intelligently designed, and compelling?

The Collective and the Individual in Russia: A Study of Practices. By Oleg Kharkhordin. Berkeley: University of California Press, 1999. 418p. \$50.00.

Michael Urban, University of California, Santa Cruz

This is one of the most important books ever written about Russian politics and society. Applying a Foucauldian frame, it aims to provide an archaeology and a genealogy of Soviet civilization, focusing in particular on the production of its corresponding modal individual. The argument is layered by learned forays into many literatures. Kharkhordin juxtaposes controversies in the early Christian Church with their twen-

tieth-century counterparts in the Communist Party, compares Russian medieval monastic practices with manuals on social technology published throughout the Soviet period, and delves into the associations between blue jeans and belles lettres. The book's immediate effect is to engender radical revision of our conventional understandings of the Soviet Union. Any number of on-going controversies—the progression from Lenin to Stalin, the Great Terror, the post-Stalin "liberalization," perestroika and the disintegration of the Soviet state—are illuminated in novel and provocative ways. The deeper contribution flows from the book's challenging implications concerning how we construct politics, especially comparative politics, as an object of investigation.

In the foreground of this study is what the author calls "background practices," a concept derived from linguistics and discourse analysis that has been refltted for the dissection of social phenomenon at the micro level. A correlate of Pierre Bourdieu's "habitus" (Outline of a Theory of Practices, 1977), background practices are those taken-for-granted aspects of human activity that are indispensable to the meaning assumed by that activity itself. They represent its "conditions of possibility" (p. 11), constituting actions in particular ways in correspondence with culturally shared understandings about them. For instance, I "naturally" write this book review in a particular style—and can even play with the conventions of that style-because of a host of background practices that inform the academic enterprise. Were I reviewing this book for, say, the secret police or the Holy Synod, a different constellation of background practices would constitute this as a very different endeavor. The author's aim is to isolate the (changing) background practices specific to Soviet civilization, trace their genealogy from prerevolutionary through Soviet times, and thus lay bare the content of those practices that represent Soviet civilization and the individuals who inhabited it.

In historical perspective, the narrative begins at Christendom's fork into Eastern and Western churches. Whereas Western Christianity would come to privilege the practice of private confession over public penance, brethren in the East would reverse that balance. Consequently, Orthodox Russian theological and catechistic discourses valorized the manifestation of saintliness via objectifying practices available to the public gaze much more so than was true in the West, where, along the lines of Michel Foucault's History of Sexuality (1978), an entire technology of the self eventually grew out of the confessional focus on individual interiors. In this respect, Kharkhordin demonstrates that the Bolshevik transformation, which was primarily a reconfiguration of the ensemble of extant social practices, owed incomparably more to background practices inherited from the Russian Church than it did to Marxism.

The key elements in the argument are these. (1) The modular form of Soviet social organization, the collective, represented a constellation of background practices mainly derived from Orthodox teachings and monastic life. (2) The authorities conceived of collectives as units invested with subjectivity, as reasoning bodies with their own goals, consciences, and wills. (3) In order to realize that subjectivity, their members were required to practice mutual surveillance, which combined in shifting measures the operations of revealing, admonishing, and excommunicating individuals. When the former two elements in this trinity (revealing and admonishing) were emphasized, a relatively benign totalitarian logic prevailed in public life. During the 1930s, however, when the ruling party altered the prescription by dropping the element of admonition and assigned to collectives the

task of revealing and excommunicating their members, the ensuing dynamics produced the bloodbath.

The changing constellation of these three seminal collective practices constitutes the stages of Soviet development. Concomitantly, out of that development was born the Soviet individual. Subtextually, the reader senses that individuation—both in the objective sense of regarding people as individuals responsible for their actions and the subjective sense of individuals capable of self-perfection—was little advanced in Russia until the Bolsheviks began processing the peasant masses with the machinery of collectives. It was there that public selves would be revealed. In opposition to that onerous process, private selves would cohere around that which individuals were able to deny to the collective—their inner lives, which increasingly supplied refuge from relentless mutual surveillance. This is perhaps the most original and provocative aspect of the book: the genesis of the Soviet individual. Central to the author's account is a reversal of Ken Jowitt's (New World Disorder, 1992) concept of dissimulation in communist societies, understood as the learned capacity of each individual to put on a public show of loyalty and enthusiasm about things that she regards with indifference, if not downright hostility. Whereas Jowitt characterizes dissimulation as a technique for protecting some already existing private self against the hazards of collective life, Kharkhordin sees its Russian variant as the very source of that private self. It is through dissimulation that individuals revealed to themselves that which they were not; having made that distinction, the next step would be to discover who they were.

That discovery follows an ironic path from the seamless oppression and falsity of public existence to the liberating and authentic experience of the self in close circles of friendship. Thus, the practices ubiquitously installed by the state in the official sphere-collectives engaged in mutual surveillance, revelation, admonition, and so forth-increasingly represented hollow institutions governed by the practice of dissimulation; simultaneously, those same practices were reproduced spontaneously in private life, which engendered a particular Soviet personality who submitted to them and who constructed selfhood on the basis of the intense interaction that they involved. Without rehearsing the various venues in which this process—always negatively determined by the state and its all-embracing collectives—occurred, the main point is perhaps already clear: Individuation in Russia has resulted from practices quite different from those experienced and performed by the Western individual. Although this distinction amounts to a matter of degree, it nonetheless would sustain the conclusion that individuals produced by means of different background practices cannot be meaningfully grouped under universal categories.

For comparative politics, the implications of that conclusion are profound indeed. Ignorance of the relevant background practices invites mischaracterization on the part of the observer and thus guarantees mistaken analysis. Consider, for example, the category "democracy," whose presence or absence has always loomed large in Western studies of Russian public life. Unawareness of the practices of Soviet collectives in the 1930s could easily have led the uninitiated student to regard as democratizing the party's 1937 decision to conduct its selection of officers on the basis of competitive elections with secret ballot. In fact, that decision served as a stimulus to redouble the savagery in public life.

Similarly, the democratization thought to flow from the reforms of perestroika takes on an entirely different character in light of Kharkhordin's discussion of the hollowing out of official collectives in mature Soviet society and the corresponding migration of their background practices to the private sphere. The space opened by the relaxation of repression meant that an alternative to social relations based on collectives was not imaginable. Members therefore withdrew from them even more, and activists who derived status from their police functions in collectives deserted, too, identifying a far better arrangement for meeting their aspirations in the formation of gangs that could exact sought-for things much more efficiently through the direct application of violence. From this vantage, perestroika did not so much mediate a transition from a communist state to a democratic one; rather, it marked the replacement of a society based on collectives to one governed by gangs.

Post-Communist Party Systems: Competition, Representation, and Inter-Party Cooperation. By Herbert Kitschelt, Zdenka Manfeldova, Radoslaw Markowski, and Gábor Tóka. Cambridge: Cambridge University Press, 1999. 457p. \$69.95 cloth, 24.95 paper.

John Nagle, Syracuse University

This volume represents an important progression in empirically grounded and theoretically sophisticated work on the party politics of the new postcommunist democracies in East and Central Europe. Based on interviews from early 1994 with 481 party leaders in Bulgaria, the Czech Republic, Hungary, and Poland as well as citizen surveys in each country, the authors examine and compare the systems of party competition and cooperation and party representation of voter preferences.

The authors offer a theoretically refined and consistent perspective of party system development based on the continuing interplay of legacies from the particular type of communist system (with major influences on the birth of parties and party competition) and the learning process for parties within the new institutional framework of democratic multiparty electoral competition. Each section contributes to fleshing out the divergent qualities of democratic politics, using both deductive reasoning and hypothesis building as well as hypothesis testing and inductive modification from the empirical data. This study extends Arend Lijphart's research project into new territory, an important sign of the extent to which East and Central Europe have joined the Western comparative research agenda.

The authors take seriously the social structures and developmental politics of the communist era, building a typology of bureaucratic authoritarian (Czechoslovakia), national-accommodative (Poland and Hungary), and patrimonial (Bulgaria) communist regime types. Diversity in communist politics creates initial path diversity in postcommunist politics. This important starting point of significant communist-era diversity, so at odds with theories of totalitarianism but increasingly recognized through the post-Stalin years, led such observers as Joseph Rothschild to focus especially on the "return to diversity" feature in East and Central Europe by the mid-1980s. Yet, with the surprisingly swift and largely peaceful collapse of European and Soviet communism in 1989–91, this hard-won recognition was swept away by notions of a tabula rasa or historical vacuum that Western norms and practices, economic and political, could quickly fill.

This book rejects the tabula rasa thesis and begins the overdue task of systematically relating the quality of multiparty democratic practices to the continuing effects of specific communist structures and practices. Yet, the authors do not give in to any blanket notion of historical legacy; rather, they

specify those aspects of communist society and its demise that have particular influence on the formation of the new democratic politics. In this context, political actors engage in a dynamic learning process, using resources, legacies, and new institutional rules to develop different patterns of democratic competition (p. 45). One concern, however, is that the three categories of this typology (bureaucratic-authoritarian, national-accommodative, and patrimonial) seem tailored so closely to the four countries that one inevitably reads in the country names and country specifics. How many other "types" of communism are there? Are other countries mixed cases? A typology too differentiated loses its comparative power and theoretical interest. Each regime then requires its own categorical value.

This is not a book for those unfamiliar with the politics of the region. The authors have done well to provide very brief sketches of the many parties that had by 1993-94 made their appearance in the new party systems. But their attention is on measuring variables such as issue salience, programmatic diffuseness, and polarization of issues across the party spectrum; little space is devoted to the "flesh and blood" of political life, the colorfulness of individual leaders, or the evolving discourse among elites. The uninitiated may well get lost in the welter of party names and the hypothesized relations among parties (both cooperative and competitive), especially since there has been very considerable turnover in parties and significant migration of party programs since the data for this study were collected. There is no practical way in one volume to provide rich narratives of the new democratic politics for all parties in all four countries as the setup for the rigorous quantification, hypothesis formation, and empirical testing that is the real core of the project, and the authors had to make a hard choice. But this does present a problem for the reader who is not already well versed in the subject.

The project's quantitative approach, although ground-breaking and intelligently executed, does have its limitations. For example, is the Bulgarian Union of Democratic Forces a single party or not? Probably not, although it is treated as such in the quantitative analysis. Similarly, the fate of the Solidarity Election Action Party (p. 211) deserves more discussion, since it has become a major question mark in the Polish party system. In Hungary, the Independent Smallholder Party (FKGP) is classified (p. 353) only as an agrarian party and the Hungarian Justice and Life Party (MIEP) as the nationalist party, but FKGP leaders (and not just Josef Torgyan) are markedly antiforeigner, anti-Semitic, antiliberal nationalists not so far from MIEP leader Istvan Csurka. The quantitative imperative to place each party in just one slot is constraining and loses some valuable information.

As the authors repeatedly acknowledge, their data represent a single point in time, and replication is needed to develop the longitudinal trajectories of each party system. They are meticulous not to overreach, perhaps in part because of the significant changes in individual parties (Fidesz in Hungary, the Christian Nationalists in Poland) and party system competition since 1994. Apart from the legacy of communism, there is now also a growing legacy of the transition itself, of marketization and privatization, of IMF and EU guidance, of renewed aggregate growth and new inequalities; what political reasoning for party elites and voters emerges from this now more extended transition? Was 1993-94 a "special" period, when voters had their first chance to judge the work of postcommunist governments, with high hopes of economic revival but growing awareness of the pain? Is 1999 (after ten years of experience) another special period, with lots of cynicism, disillusionment, and bitterness, even in the best-placed candidates for EU membership? It

will be important for comparativists to follow up on this important work. The authors have set a new and higher standard and have generated rigorous but tentative interpretations of the differentiation among postcommunist party systems and the quality of democracy achieved.

Regulating Finance: The Political Economy of Spanish Financial Policy from Franco to Democracy. By Arvid John Lukauskas. Ann Arbor: University of Michigan Press, 1998. 326p. \$52.50.

Peter McDonough, Arizona State University

A full quarter of a century has passed since Spain undertook its transition to democracy. That experience is now one of the most amply documented in the third wave of democratization, which began in Portugal in 1974. Arvid Lukauskas makes a welcome contribution to this crowded field.

Regulating Finance is, despite the title, a study of deregulation. The basic argument is that Spanish democracy, and in particular an electoral system that favored the development of a few large catch-all parties across a heterogeneous citizenry, created incentives for politicians to deregulate the country's financial structures. State managers opened up the financial system, making it relatively transparent in the face of opposition from interests favored under the old regime and in the midst of indifference on the part of the public.

The paradox suggested by the title comes from the fact that public figures—elected politicians and ministerial bureaucrats, rather than private bankers and financiers—initiated and carried through a program of deregulation. They gambled, correctly as it turned out, that deregulation would increase public revenues, which would promote the solvency of the state just as democratization was unleashing demands for governmental expenditures. Enhanced economic performance paid off in increased political support. Spanish politicians—notably, those associated with the Socialist Workers Party of Spain (PSOE), the socialist party that governed from 1982 through the early 1990s—did well by doing (the collective) good.

Regulating Finance is persuasive on several counts. Lukauskas captures the air of supreme pragmatism that enveloped Spanish elites and the public like an obsession during the years of the transition and their immediate aftermath. Most Spaniards yearned to overcome the radicalism that had sent the country into civil war when democracy had been tried in the 1930s. The once intransigent socialists were probably even more eager than their conservative rivals to embrace a political style—"model" would be misleadingly precise—that favored economic growth, one with a distributive cast that rendered it palatable to a democratic clientele.

Lukauskas takes us through a careful case study of the ins and outs of financial reform during the center-right and later the socialist governments that made and consolidated the transition. His concluding chapter extends the analysis by examining variations in financial liberalization in Brazil, South Korea, and Turkey, all of them similar to Spain in terms of the transition from developmental authoritarianism but different in their postauthoritarian policies and economic performance.

Most of the book is a resolutely rational choice account of the ways in which institutional incentives shunt self-interested politicians down vote-maximizing pathways. At the same time, a truly convincing facet of *Regulating Finance* lies in the acknowledgment of the limits of institutional constraints in accounting for political behavior. Lukauskas is alert to the fallacy common in some soft rational choice work, to the effect that once you have the incentives straight, understanding the course of political action is fairly straightforward. That approach tends to gloss over the strategic complexity, erratic learning curves, and multiple equilibria—in brief, indeterminate outcomes—generated by even short-term interactions among multiple players. The case study material presented in *Regulating Funance* goes a long way toward curbing this trivialization of rational choice theorizing, even if Lukauskas does not develop a formal model of the politics of deregulation.

In the exogenous zone of the causal equation, Lukauskas also recognizes that a variety of factors in addition to institutional rules—historical legacies, culture, cleavage structures, transnational influences, and so on—may condition political outcomes. One benefit of the cross-national foray in the concluding chapter is that it enables Lukauskas to deal with these outside factors in something like systematic, if summary, fashion. (The next step might be to extend the perspective used in *Regulating Finance* beyond the standard political economy framework to encompass not only different countries but also different and less self-evidently instrumental families of policy disputes.)

Yet, it is also in the more axiomatic treatment of causal elements that the book runs into trouble. Lukauskas claims, at length and repeatedly, that Spanish politicians are self-interested actors who seek to retain power and that this ultimately explains why they responded to changes in institutional incentives in the way they did. It is possible to agree with the first assumption (indeed, it seems impossible to disagree with it) and still wonder what exactly it has to do with the second assertion. Since the self-interest/power-retention maxim is not a variable at all, it is difficult to see what explanatory function it serves, except the peripheral one of a kind of mantra to assure the reader that, yes, even Spanish politicians are rational and that the author has not been gulled by rumors to the contrary among purveyors of the Hispanic mystique.

The difficulty here is not with the supposition of rationality or self-interest but with the doubtful utility of a construct so generically construed that it fails to clarify the specifics of motivation and behavior. Lukauskas lists the names of more than a dozen government officials and politicians he interviewed, but it seems he never asked them directly about the reasons for their decisions or about what incentives they believed they were responding to; if he did, he does not report this information. Not a single quotation, not one sound of any Spanish voice, appears in the book. An editorial case can be made for this mode of presentation, but the result is unduly schematic. It is hard to shake the feeling that this chaste realism derives from the economist lore that measuring anything so ethereal as an attitude or a perception, a preference or a taste, is nowhere near so important as deducing it. This assent to the higher squeamishness creates a forensic problem. Lukauskas is left to "contend" or to "claim" or to "argue" that Spanish elites must have been motivated in one way or another, when he might have told us something about how they themselves interpreted their actions at first hand.

The argument is consistent with the evidence presented. But other explanations and interpretations are also consistent with similar evidence. Sofia Pérez covers much the same ground in Banking on Privilege: The Politics of Spanish Financial Reform (1997) and in "From Labor to Finance: Understanding the Failure of Socialist Economic Policies in Spain," Comparative Political Studies 32 (September 1999): 659-89, and she arrives at rather different conclusions about the rationale and beneficence of economic liberalization. It is an indicator of how far we have come in studies of democ-

ratization, not to mention from disquisitions on what used to be called the relative autonomy of the state, that genuinely sophisticated works such as *Regulating Finance* can produce disagreement for methodological and substantive reasons without detracting from the valuable advance Lukauskas has made over previous research.

After the Propaganda State: Media, Politics, and "Thought Work" in Reformed China. By Daniel C. Lynch. Stanford, CA: Stanford University Press, 1999. 327p. \$55.00.

Yanqi Tong, University of Utah

The fact that the Chinese communist government has been losing control over the flow of communication is no news to the student of Chinese politics. Yet, Daniel Lynch is the first to describe this development in detail and analyze it systematically. Combing through a wealth of materials (official documents, newspapers, journals, and interviews), the author thoroughly traces the erosion of the propaganda state of the Maoist era and offers a colorful picture of what he calls "a praetorian public sphere" in China today.

The central argument is that a combination of administrative fragmentation, property rights reform, and technological advance has led to the breakdown of the party-state's ability to engage in "thought work," a Chinese communist term that refers to the party-state's struggle to control the communication flows that shape the perceptions, attitudes, and values of the population. Lynch suggests that these three trends have subjected China's mass media to the processes of commercialization, globalization, and pluralization. Commercialization refers to the increasing tendency of the mass media to cater to the tastes of its customers in order to boost profits. Globalization refers to the importation of foreign messages. And pluralization is the proliferation of sources of information.

Although these processes have seriously eroded the state's ability to engage in thought work, Lynch notes that they have not produced a liberal public sphere in which individuals and groups in civil society freely create and circulate thoughtful political messages in a well-structured and institutionalized manner. Instead, borrowing a term from Samuel Huntington, Lynch argues that China's public sphere is characterized by a form of "praetorianism." That is, neither the state nor any other organized political force can impose order on the mass media, and the construction of culture becomes excessively market oriented without being directed toward the achievement of public political goals.

This is a fascinating book for those interested in the evolution of Chinese media and communication markets (television, radio, newspaper, telephone, publishing, advertising, and journalism) over the past twenty years. The processes of commercialization, globalization, and pluralization in China are carefully documented and analyzed. The book is full of detailed information about the changing forms of mass media, such as paid news, soft advertising, and "edgeball" journalism (which pushes the limits of permissible discourse), that are characteristic of the Chinese political system in transition.

Lynch also pinpoints, although somewhat implicitly, an important theoretical issue. Recent advances in information technology have produced a revolution in communications, which in turn will very shortly change the means of political interaction. Specifically, the rapidly expanding public sphere produced by the Internet will challenge authoritarian regimes in ways that no established theories can fully predict. This

volume has no doubt laid a foundation for future research on this exciting subject.

I do, nevertheless, have two reservations. First, the author has not pushed his work to the theoretical level that he is capable of achieving. The breakdown of the state control over thought work in China and the emergence of a chaotic sphere of public discourse are integral parts of the broader transition from totalitarian and authoritarian rule. This could have provided the basis for the author to present some more theoretically informed generalizations about the process. Although Lynch does try (in chap. 7) to locate his conclusions in the wider literature on transition, this part of the book seems to be more an afterthought than an integral part of the analysis. The author correctly notes that the current literature on transition overlooks the role of the media and the revolution in communications, but he does not specify the extent to which his work may contribute to theory building in this regard.

Moreover, although Lynch identifies administrative fragmentation as one causal variable that explains the emergence of a "praetorian" public sphere, he gives the impression that the state is merely a single-minded actor trying desperately, but unsuccessfully, to regain the control over thought work that it unintentionally lost when it launched economic reform (pp. 12–5 and chap. 6). If the author could come up with an analytical framework that would reconcile these two seemingly contradictory themes, then the theoretical implications would be much broader. After all, the commercialization, globalization, and pluralization of the mass media that was once (and to a large extent still is) part of the state apparatus requires a more nuanced analysis of the state.

A final and minor reservation concerns the author's use of property rights reform as a major causal factor (p. 7, and pp. 41-4) in his analysis. Lynch's basic argument is that now that the mass media have become responsible for their own profits and losses, they seek to maximize their profits by way of commercialization. What is not clear is to what extent this responsibility for profits and losses (more precisely responsibility for profits only) is the result of property rights reform. Surely, all the media stations and most publishing houses are still owned by the state. The introduction of market mechanisms, and the resulting change in incentive structures, seems to be a more appropriate and straightforward causal factor than property rights reform in explaining the commercializing of the mass media.

In short, this book is the best available description of the transformation of the mass media in post-Mao China. The author would have made an even greater contribution if he had been able to show how this is part of the broader transition from totalitarianism, and how in turn it will challenge the state's effort to preserve authoritarian rule.

Ideology and Change: Transformation of the Caribbean Left. By Perry Mars. Detroit, MI: Wayne State University Press, 1998. 230p. \$65.00.

Horace G. Campbell, Syracuse University

The violent implosion of the Grenadian Revolution in October 1983 brought to a close a phase in Caribbean politics when groups calling themselves the Left sought to use their place in government, trade unions, and universities to put forward an alternative agenda. This form of political intervention can be compared to other forms of interventions in the Caribbean. The most enduring has been that of the Rastafarian movement, which placed the stamp of Babylon

on official society. This movement, despite its contradictions, calls for a rejection of Enlightenment philosophies that placed an artificial distinction between spirit and matter. In a profound sense, the Rastafarians have made a fundamental contribution to the Caribbean in exposing how the ideas of the Enlightenment with regard to linear determinism, mechanistic predictability, and property rights were based on Eurocentric conceptions of society. A second contribution has been made by feminists, who have critiqued leaderism and androcentrism in Caribbean politics. Rhoda Reddock, in Women, Labour and Politics in Trinadad and Tobago (1994), attempted to correct the preoccupation of political scientists with only half the population and the inadequacies of the theoretical frames through which the societies in the region were analyzed. By focusing on an individual, Reddock demonstrated the contradictions of the Caribbean scholars who were reared in the Anglo-American tradition of focusing on great men. The Grenadian, Rastafarian, and feminist contributions provide a context for the book by Perry Mars on the transformation of the Caribbean Left.

Ideology and Change takes the reader through the past forty years of Caribbean politics, with particular attention to those at the forefront of the "radical" organizations. The author defines leftist politics as "the study of the groups and individuals seeking to challenge or change the dominant ideology and political system by a variety of conventional or unconventional means" (p. 40). Apart from the New Jewel movement in Grenada, which came to power outside the Westminster model of politics, the main parties and organizations adopted conventional means in their quest for power.

Some of the political leadership in the Caribbean associated itself with the ideas of Fabianism, the Social Democracy of the Second International, and other conceptions of Left politics from Marxists in Europe, and Mars demonstrates the borrowings at the level of ideology as well as the ambivalence of the middle class. He takes the reader through the global context, the specific Caribbean conditions, the genesis of the Left, the agenda of the Left, the quest for power, leadershipmass contradictions, destabilization and disintegration, ideological effects, and the future of left-wing politics. The book's silence on the Cuban and Haitian revolutions is compounded by its equivocation at the theoretical level on the concept of revolution. One major limitation of intellectuals in the English-speaking Caribbean has been their failure to probe the depths of the Cuban political process and its effect on the Western hemisphere. Throughout the text the author essentializes the concept of the Left and takes the self-proclamations of various leaders at face value.

One point brought out is that thus far Caribbean political scientists have been unable to place their own stamp on an alternative conception of the political process. This task has been attempted by feminist scholars and by historians, but political scientists are still caught in the mold of organizational theory, modeling, opinion polls, structural functionalism, and the elements of politics that emanate from the systems analysis theories of American political scientists. The book examines the leftist ideology of leaders and organizations, but it is not clear how different these are from the conventional forms of state legitimization in former colonial territories. The manipulation of nationalist symbols and radical language has been the hallmark of neocolonial leadership throughout the underdeveloped world.

Ideology and Change is part of a wider discussion on the moral responsibilities of the Left. Recent calls for a truth and reconciliation commission in Jamaica and for an investigation

into the assassination of Walter Rodney in Guyana expose the unease with the record of sections of the Left. Former leftist leaders have published books, such as Trevor Munroe (The Cold War and the Jamaican Left, 1992). Others, such as Rupert Lewis, have investigated Rodney's intellectual and political thought. It is significant that Lewis, who was along with Munroe a member of the same leftist formation (the Workers Party of Jamaica [WPJ]), took a different path from Munroe after the fall of the Berlin Wall. There is now throughout the Caribbean the demand for self-criticism on the part of the Left for its role in Grenada. The place of the Peoples National Party under Manley and that of the WPJ under Munroe in the struggle for change is analyzed by Mars, and he was able to avoid the pitfall of placing too much emphasis on charisma and other formulas that have dogged the study of Caribbean politics since the time of Eric Williams.

The other important study that appeared at the same time as that of Mars is the book by Winston James, Holding Aloft the Banner of Ethiopia: Caribbean Radicalism in Early Twentieth-Century America (1998). This important historical work drew attention to the origins of the radical traditions in the Caribbean in the twentieth century and brought out the interconnections in social conditions throughout the region and the linkages among organizations irrespective of language. The James contribution stands out in exposing how the radical traditions of the Caribbean Left made fundamental contributions to radical intellectual and political traditions in the United States.

The contribution of Marcus Garvey and other Caribbean nationals—such as C. L. R. James, George Padmore, Elma François, and Walter Rodney—to the ideas and organizations of those struggling against oppression all over the world is now well known. Less well known are the antidemocratic conditions in the Caribbean that constrained their linkages to the toiling masses. Mars brings out the challenges faced by those who seek fundamental change, and from this book it becomes clearer why people like Rodney or Garvey cannot thrive in political structures of the Caribbean. What is needed are new structures, which is one conclusion that can be drawn from the book.

Another is the more explicit conclusion of the author that there is no future for leftist politics in the English-speaking Caribbean. This is not the view of Winston James, Rupert Lewis, and Rhoda Reddock. The difference stems from their different starting points for discussing the Left. The conclusion of Mars is flawed precisely because the theoretical base of the book is essentialist in defining the Left. It would be difficult to term as leftist the practices and ideas of such groups as the People's Progressive Party and the People's National Congress in Guyana, or the People's National Party of Jamaica, despite claims of the leadership. Mars himself introduces the novel concept of "democratic dictatorship" to characterize the government of Forbes Burnham in Guyana. One then wonders how the same author who documents the brutality of this government can label it "Left." More important, the manipulation of race and ethnicity on the part of both the Guyana parties left a tradition of division and insecurity that was incompatible with a society seeking the confidence for change and transformation.

The lack of a critical analysis of the transformation issue reinforces the theoretical flaws of the book. Another weakness is the absence of an analysis of the limitations of androcentrism in Caribbean politics. In theory and in practice, those seeking a new mode of politics in the Caribbean have made striking contributions in the past decade. In the case of Guyana, a formation such as the Red Thread seeks

consciously to rise above both the forms of electoral competition and the divisions of the working people. By seeking to develop an alternative space for political mobilization for women, this group is demonstrating that the transformation of politics is bound up with addressing the insecurities of the middle class and their Eurocentric preoccupations. The present conditions of politics in both Trinidad and Tobago and Guyana attest to the legacies of the middle class in dividing the working people and manipulating the symbols of progressive politics. In a profound sense the Mars book points to the necessity for turning away from the intellectual retrogression of the middle class.

Parliamentary Representation: The Case of the Norwegian Storting. By Donald R. Matthews and Henry Valen. Columbus: Ohio State University Press, 1999. 211p. \$49.95 cloth, \$23.95 paper.

Knut Heidar, University of Oslo

This is a fresh and insightful book by two major contributors to empirical political representation research for more than 40 years. Their general question springs from the concerned democratic tradition that asks how "the many" can be represented in political institutions by "the few." In this case the institution is the Norwegian parliament, the Storting, and the answer is that the Norwegian representative democracy seems to be doing well—particularly in comparative terms despite successive minority governments, multipartism, a consensual style in politics, and other factors that make for a somewhat hazy elite accountability. The authors are, however, reassured by their finding that "much of Norwegian politics consists of the active minority, including members of the Storting, trying to anticipate what the interests and preferences of the quiescent are, or might become in the future" (p. 182).

The theoretical problem raised in the book is "how legislatures and legislators represent the absent others" (p. 2). In discussing models and methods in representation research, the authors argue that U.S. dominance in the field is "not always helpful in comprehending representation in other legislatures" (p. 3). Their own approach distinguishes among three types of responsiveness—policy, service, and symbolic—and two levels of representation, the individual parliamentarian and the aggregate parliament. They also emphasize that "representation" is a process, and they identify three models in the literature that give different answers to how this process produces representative assemblies: the party mandate, corporate pluralism, and principal-agent models. These are not tested but are presented as heuristic devices to help understand representation processes, and Matthews and Valen criticize much contemporary research for being both too individualistic and too static and ahistorical.

The empirical basis of the research derives from several projects carried out in conjunction with the 1985 Storting election: a voter survey, a survey of delegates to the party nominating meetings, a survey of the elected Storting representatives, and a data file with biographical information on Norwegian MPs. The book provides historical perspective on the evolution of Norwegian politics since the nineteenth century and in practice gives a broad introduction to the Norwegian political system as it operates in the latter decades of the twentieth century. There are discussions about the

development of Norwegian consensual democracy and its cleavage structure, the roots of the electoral system and its current Proportional Representation formula, the basic institutional setting of the Storting, and basic facts about the party selection of candidates for the electoral lists. Then the focus shifts to voters, activists, and their opinions before we are given a tour of the parties—their members, activists, leaders, and manifestos. Finally, Matthews and Valen examine the "groups" represented in the Storting in terms of MPs' sociodemographic profiles before they turn to the organization and political processes inside the Storting itself. All is well structured and well produced.

This skeleton description of content cannot do justice to the richness of the empirical material. The litmus test of the book is whether its analytical focus generates general and comparative findings that advance scholarship. In my view the book passes well on that score. A small quibble is that the authors could have given more space to general reflections over "the case" and the typologies and models—to highlight, criticize, and suggest—toward the end. But these are rocksolid folks, not much prone to lofty pronouncements.

In the central part of the book-chapters 5-9, which address the relevance of the three models of representative processes—there is plenty of food for the general discourse on representative democracy. Only a tiny elite (5%) contributes to the selection of candidates for the Storting list, and this group is not very representative of voters in terms of age, gender, education, and occupation. The voters have a low level of name recollection when asked about the candidates in their constituency (chap. 5). Actually, the voters are not very interested in politics; they are not very knowledgeable and have, with the very significant exception of voting turnout, a low level of participation. A small, self-chosen elite of about 15% of the electorate is active, interested, and informed. The good news is that this elite actually is fairly representative of Norwegian voters in terms of sociodemographic composition (chap. 6). In the discussion of political parties, the mandate model is not found to fit very well, as the voters do not respond much to party positions on contemporary issues. Without sufficient knowledge, they vote more on the merit of past party performance than on the issues of the day. The MPs vary in terms of representative focus (district, party, particular groups) and experience a varied input of viewpoints from the outside through numerous group contacts. They also become policy specialists through their committee work, but the parliamentary party groups appear to be rather effective agents in shaping the policy profiles of the representatives.

Matthews and Valen conclude that the mandate theory is difficult to apply in Norway since the linkage is weak between electoral opinions on current issues and consensual party politics in the Storting. The merits of the corporate pluralist and principal-agent models are left more in the dark. This is probably so because the implications of the mandate theory are more clearly spelled out than those of the other two. This volume, as a good book should, leaves us with both new answers and more questions. How could these models be given a more cutting edge? That would give the Norwegian case (and others) potential for carrying even more fuel to the general and comparative debate on how to make the "absent others" present.

For teaching purposes I recommend the book for general courses in European and Nordic politics as well as for courses in political representation.

The Agony of the Russian Idea. By Tim McDaniel. Princeton, NJ: Princeton University Press, 1996. 201p. \$14.95 paper.

Arthur H. Miller, The University of Iowa

All post-Soviet societies faced the challenge of constructing a new identity that is both national and democratic. Yet, not long after the Soviet demise, initial public optimism about the future of a new Russia was replaced with growing concerns about corruption, crime, economic uncertainty, and the absence of a unifying national identity. In an attempt to address the latter issue Boris Yeltsin, after his reelection in 1996, set up a committee to produce a new "national idea" that would define the Russian essence and inspire its people. At the time of this writing, the committee is still searching.

A book entitled *The Agony of the Russian Idea* should have something worthwhile to say to the Yeltsin committee and to scholars interested in the historical development of Russian national identity. Both groups may be disappointed. The committee will find a very pessimistic interpretation of both the historical path that has produced the various elements comprising the "Russian idea" and what the future holds for contemporary Russians. Scholars will find that, while the author realizes there are two ways to deal with a historical presentation of the Russian idea, he adopts the one that promotes an argument rather than a careful analysis.

Early on McDaniel notes that the Russian idea may reflect that which is seen to be distinctive about Russian culture and institutions or it may represent an ideal model of society based on whatever elements the writer believes are the predominant elements of the culture. This is not a traditional intellectual history but McDaniel's interpretation of work produced by Russian intellectuals, who in many cases have presented an idealized version of the principles inherent to Russian life, culture, and institutions. This does not mean that scholars should dismiss the book as irrelevant, but they should realize what it does and does not do. It is a good example of how the evaluation of any study of Russian national identity has been changed by the fall of restrictive communism.

Today, we are able to examine both statements of what beliefs are prevalent among Russians and their idealized hopes for tomorrow by using surveys to probe these questions directly. Such evidence can then be compared with the statements of those who write about contemporary history. McDaniel's argument is most convincing when he focuses on earlier periods of Russian history, because we have no readily available corroborating evidence against which to test his statements. But when historians stray into contemporary times, their interpretations and outright claims for reality are open to challenge, now even in Russian. Thus, the standards for scholarship are raised and moved from the realm of pure opinion or journalism to the realm of science, with its demands for validity and replication.

The "Russian idea," McDaniel tells us, reflects "the conviction that Russia has its own independent, self-sufficient, and eminently worthy cultural and historical tradition that both sets it apart from the West and guarantees its future flourishing" (p. 11). He goes on to say that all the Russian thinkers who address the idea posit a higher form of modernity for Russia. Various principles and values of Russian culture are presented as the unique elements of the Russian idea. These are readily identifiable in the writings of the intellectuals cited by McDaniel, and chapter 1 is devoted to cataloging the positive and negative elements that comprise the Russian idea.

McDaniel presents three "negations" that contradict the presumed uniqueness of the Russian idea as well as introduce

the negative aspects of presumed Russian identity. The contradictions involve the realization that the Russian idea is not uniquely Russian but partly dependent on a reaction to the West, and there is not one Russian idea but competing visions of what was dominant in Russian culture during the nineteenth century as well as today. According to social psychological and anthropoligal theories of identity, all social and national identities have an "us" versus "them" quality. For the Russians, the West and its stereotypical features (capitalism, materialism, individualism, legalistism, rationalism, and immorality) epitomized "them."

Within the "four affirmations," McDaniel presents Russian identity or the image of "us" as based on ultimate goals or values: a higher moral order; nonrationality, a preference for communal interpersonal relations, such as occur in the peasant communes, as opposed to legal and formal interactions; an emphasis on equality; nonmaterialistic values; and a penchant for a paternalistic state. Such is the picture of traditional Russian culture as portrayed by the Slavophile intellectuals.

Having laid out the content of the Russian idea, McDaniel goes on in later chapters to argue that the end of tsarist and communist Russia occurred because of the contradiction inherent in a state that promoted modernization while trying to maintain the traditional Russian idea. Communism was doomed to fail because "instead of the old values of selflessness, modesty and compassion, Soviet Communism had ushered in a stage of crass Americanization of values. Young people especially seemed to be absorbed with technology, athletics, and practical results; they had no time for the moral dilemmas explored by classical Russian culture" (p. 92).

Today, according to McDaniel (chap. 5), the Yeltsin government is also sowing the seeds of potential future collapse because reforms are based only on economics, thereby ignoring the spirituality of the Russian idea. In order to succeed, current reforms must provide a bridge to a past Russian identity by promoting the ideals of equality, moral virtue, community, and the responsibility of government for social welfare. While I agree that post-Soviet reformers might be well advised to work toward those goals, one could hardly argue that these are uniquely Russian. All governments are well advised to pursue such goals. In short, this book does not provide the answer for the committee seeking a new Russian idea. That committee should be told, however, that identities arise out of long-term shared experience, not committee deliberations.

Certain aspects of the traditional Russian identity discussed by McDaniel can be found among the attitudes of contemporary Russians (particularly concerns about inequality), but the book is replete with statements that would have been well informed by a familiarity with current survey research. Perhaps the most egregious misstatement in the book is the following: "Communism is now widely regarded as a German plot, or the evil work of non-Russian nationalities, particularly Jews and Georgians, who imposed these non-Russian ideas upon the innocent Russian people" (p. 53). No doubt one can find some Russians who express this view, but to claim that this is a "widely" held belief is simply inaccurate. The reformed Communist Party is the single strongest party in Russia today, and slightly more than 60% of Russians still think of themselves as Soviets, so there is little evidence that the former regime is regarded as a hated foreign plot. Given the ideas expressed in this book, it should provide excellent grist for the critical thinking of any graduate seminar examining the concept of identity.

Inequality, Democracy, and Economic Development. Edited by Manus Midlarsky. Cambridge: Cambridge University Press, 1998. 281p. \$64.95 cloth, \$24.95 paper.

Jacek Kugler, Claremont Graduate University

This collection of essays provides a multifaceted perspective on the process of economic development and its connection to politics and inequality. The reader is exposed to a number of approaches, whose results challenge existing connections among these elements and open new vistas on the complexity of such interactions. A number of possible paths for future analysis are followed. This collection, however, does not provide a unified structure that could be used to build a theory of development; rather, it encourages readers to research and resolve the paradoxes of democratic development

A useful way to approach this volume is to consider many of the counterintuitive insights about democracy and development. Evaluations of politics in ancient times by Bollen and Paxton, for example, show that hunting and gathering societies achieved levels of participation and equality still unmatched in developed societies. Using the ethnographic and anthropological record, Ember, Ember, and Russett argue compellingly that in ancient societies social equality strengthens democracy. This result challenges modern findings that equality weakens participation. They also show that female participation increases in peacetime and declines during conflict. Such evaluations again challenge suggestions that war mobilization opens new opportunities for women. Likewise, Midlarsky and Midlarsky find that the availability of rainfall fosters democracy, while frequent exposure to conflict and permeable borders among landlocked nations diminish the likelihood of democracy. While these works do not reach a consensus regarding the source of democratic evolution, they demonstrate that the development and sustainability of democracy are contingent on long-term structural conditions.

A major section of the book is devoted to the proposition that economic development leads to inequality and democracy. Muller extends Lipset's finding that societies in transition from very low to high income levels may find their political system—whether democratic or authoritarian challenged frequently. Moreover, he shows that income inequality tempers efforts to develop democratic structures. Thus, in rapidly growing societies, with serious inequality, democratic or authoritarian rule is precarious. Muller's results are challenged by a number of other researchers. Simpson attributes democratization to improvements in communication and literacy rather than economic growth and equality. Coppadge demonstrates that economic growth by itself is insufficient to prompt democracy. Democracy will flourish in societies that achieve economic and social performance above the mean, but empowered citizens are the prerequisite for any such movements. Crenshaw, again, challenges the notion that democracy is directly connected to growth and inequality. Instead, he finds that the expansion of technology, which in turn creates interdependence, generates the conditions under which competing political elites have leverage to pursue democracy. Finally, Simpson demonstrates that economic development has little independent effect on democratization. He argues instead that literacy generates the preconditions for democracy.

These articles all show different flows in the main thesis of modernization that connects economic development, equality, and democracy. New proposals about the underlying democratization process are proposed, but although the original argument is seriously damaged, none of the alternatives is compelling enough to replace the modernization thesis. In the end we know the connections between democracy and various aspects of modernization are far more complex than anticipated, but we still do not know what these connections are.

Another major section explores the relation between inequality and democracy. A number of possible approaches are taken to explore this interaction. Gasiorowski examines the relation between democracy and wage growth. He demonstrates that wages and growth regularly decline before a transition to or from a democratic to an authoritarian regime, but authoritarian governments do not slow growth or wages. Thus, wage and growth effects are related to transitions and are not associated with specific systems in place. Challenging assumptions about a regular path of development, Greskovits shows that Eastern European transitions do not follow patterns established by the developed North and developing South. These experiences suggest that democratic transitions can have multiple and contradictory effects. Chan reverses the causal arrow and explores how democracy affects inequality. He shows that once democracy was established, East Asian nations used the welfare system to equalize access to education and social services. These results are consistent with the Aristotelian proposition that democratic leaders will redistribute and will equalize income, presumably to increase participation and generate electoral support. Finally, in an overarching essay, Di Palma argues that market economies are necessary for social society, but markets do not suffice to prompt democracy and do not assure its permanence. Successful democracies find a compromise between the requirement of reproducing capital and achieving political consent. Classic thinkers would be comfortable with such insights.

In sum, the book successfully presents a number of conflicting perspectives that detail aspects of the evolution of democracy. Most of the empirical chapters debunk long-held assumptions and proposed direct links among growth, inequality, and democracy. The contributors consistently hint that these relations are very complex, that indirect and nonlinear effects dominate the interactions. What the book fails to deliver is a plausible general proposition or a consensus about major findings. It does not provide a general approach to the subject or reject elements that are empirically shown to be irrelevant. The evidence presented is sufficient to challenge existing constructs but insufficient to lead to a new comprehensive understanding of economic development, democracy, and inequality. Perhaps this is the inevitable consequence of the state of the field at this time. The many questions posed now have a chance of obtaining consistent answers.

Who should read this book? It is a must for advanced students of political economy and development, who will find this volume a major source of both theoretical and empirical inspiration. The number of approaches, temporal structures, variable specifications, and alternative methods used to elucidate these complex relationships is impressive and inspiring. Graduate students in particular will find a gold mine of meights, data, and research designs and will be rewarded by the complex exploration of topics that are central to our understanding of the connection between economics and politics. This work will motivate a number of scholars to look in the right direction and answer the unresolved puzzles of democracy so effectively laid out by the editor in the concluding chapter.

Rural China Takes Off: Institutional Foundations of Economic Reform. By Jean C. Oi. Berkeley: University of California Press, 1999. 253p. \$35.00 cloth, \$17.95 paper.
Contesting Citizenship in Urban China: Peasant Migrants, the State, and the Logic of the Market. By Dorothy J. Solinger. Berkeley: University of California Press, 1999. 444p. \$50.00 cloth, \$19.95 paper.

Dali L. Yang, University of Chicago

For the past two decades, scholarly attention on China has grown steadily as that vast country has reformed its planned economy while sustaining a stellar growth record. Not surprisingly, the Chinese experience has become highly significant for generating and assessing models of economic reform.

Rural China seeks to explain the sharp rise in output produced by rural enterprises, primarily in the 1980s, when publicly owned township and village enterprises led the upsurge in rural industrialization. Building on her 1992 article in World Politics and other writings, Oi concludes: "The rapid takeoff of China's rural industry was the result primarily of local government entrepreneurship" (p. 2). Oi draws on agency theory to analyze "the more successful cases" of industrialization (p. 200). She notes in chapter 2 that at the turn of the 1980s the institutional environment for rural development was transformed. Decollectivization of agriculture sharply reduced the income that local cadres could generate from agriculture, but fiscal reforms in the form of revenue contracts not only tightened the budget constraints of local governments but also offered local authorities rights to the revenue stream and limited central government capriciousness. The conjunction of these two institutional changes provided powerful incentives for local officials at the county, township, and village levels to promote industrial development. Private sector expansion was restricted for political and ideological reasons, and local officials gave preference to collective enterprises, especially the township and village enterprises.

Oi recognizes that the revenue imperative was a necessary but not a sufficient condition for rural industrial growth. In chapter 4 she argues that it was the institutions inherited from the Maoist era that provided local governments with the political capacity and policy instruments to foster the rapid growth of rural industry (pp. 95-6). She believes that this legacy, refitted for the reform era, is the foundation for a distinctive form of state-led growth. She calls it local state corporatism and claims that it is a "new form of development that is committed to growth and the market, but it is led by a party-state with roots in a Leninist system and with the Communist Party still at the helm" (p. 97). Local governments and their enterprises are in a relationship of mutual dependence rather than predation. As a result, Oi concludes, "large extractions of revenue have not negatively affected growth" (p. 98). Thus, even though local authorities gained more power and resources vis-à-vis the central government, they have practiced "positive intervention" in the economy

Oi thus joins most China specialists in pointing out that regime change is not necessary for reform and growth in a Leninist political system. Indeed, the reforms in China have served to strengthen the power of officials who pursue development. In the process, China has become "a qualitatively new variety of developmental state and not merely a modified Leninist system" (p. 192).

Although carefully crafted, Oi's study leaves a variety of lingering questions, some of which the author mentions in the concluding section. The spirit of constructive criticism re-

quires me to contribute to this conversation. For example, Oi states that the overall environment had become so friendly to development that local officials had little reason to obstruct the reforms. Moreover, the "incentives presented a legitimate alternative to corruption" (p. 56). This seems to contradict popular reports of rampant corruption in China. Indeed, in light of the Asian economic crisis, her favorable comparison of government entrepreneurship in China with that in the developmental states of East Asia also raises questions about the quality of China's growth. Not only is the degree of official intervention in enterprises greater in China than in other East Asian states, but also it is well known that local officials in China have tended to exaggerate output figures from rural enterprises. In this sense, the Chinese variety of developmental state may share the weaknesses that have afflicted others in the region. In fact, Oi notes that local officials have started to readjust their relationship with businesses in the more stringent economic environment of the 1990s. Finally, although government entrepreneurship apparently contributed to developmental successes in some places, it is worth noting that in other places the more local officials set up township and village enterprises at great expense, the poorer farmers became (Fortnightly chat, no. 13 [1999]). The state that Oi finds doing good in some places can also turn predatory in others. Oi alludes to such variations here and there, but it is hoped that future studies will pay more attention to this issue in order to determine the causes.

Whereas Oi emphasizes the positive role of the local state in generating China's rapid economic growth, Solinger focuses on the government's uneasy relationship with the millions of rural migrants in the cities. For Oi, rural industrialization was at the core of China's "economic miracle" (p. 1). Yet, although some rural communities along the coast have become models of economic success and destinations for migrant workers, a great divide continues to separate rural and urban life in China. In much of rural China, particularly the hinterland, life is still very hard indeed. In consequence, tens of millions of rural residents have left for the uncertainties of urban life as migrants or transients.

By examining this "floating population," a category that straddles the historical segmentation between urban and rural, Solinger is able to illuminate the nuances, ambiguities, and complexities of China's economic reforms. There is little of the romantic musing that some scholars have used to discuss how unorganized individuals have trumped the state. Instead, Solinger highlights how, despite the advent of the market, state institutions continue to constrain and limit the populace's spatial mobility more than in most other nations.

Contesting Citizenship is composed of two parts, each with three chapters, all backed up with a wealth of information from extensive ethnographic fieldwork and Chinese publications. Part I focuses on the structure of policies and institutions—the urban bureaucracy and the rationing or entitlements regime—with which the migrants must contend and to some extent subvert. It shows that the market has expanded against the backdrop of powerful statism in China. Not only are the networks through which the migrants make their moves partly social and personal and partly bureaucratic, but also the migrants must live with various forms of stateimposed inequities. Unlike the United States, where those from outside a state can qualify for in-state benefits, such as reduced tuition rates, after a period of residency, Chinese transients who lack urban residency (hukou) are excluded from various goods and services, ranging from education to health care to welfare benefits, to which those who possess legal urban residency are entitled. Overall, Solinger concludes that this institutional environment severely undercut the migrants' "opportunities for acceptance and inclusion among the city folk as citizens on regular terms" (p. 149). The market has not transformed peasants into citizens (although it should be noted that some once rural communities in the Pearl River Delta are doing better than most cities).

The picture is not as stark as it appears. In Part II, Solinger finds an expanding range of agency for migrants. Their very presence in cities stirs the urban labor market and has contributed to a breakdown in the government's capacity to affect the disposition of the urban work force. As a result, some urban residents have experienced downward mobility, albeit cushioned by the rudimentary state welfare system. In consequence, there has been some convergence between rural and urban.

Most interesting is Solinger's emphasis on the variations among the migrants. Some, particularly the unskilled and less educated from the inland provinces, have found second-class citizenship by signing employment contracts with urban enterprises through official sanctions. In contrast, those with capital and skills, generally from the coast, have paradoxically been living on the fringe, often literally, in the cities. Denied the opportunities to assimilate, they have formed their own communities, such as the Zhejiang Village in Beijing, thus creating an alternative to the state-sanctioned citizenship. In the process, they have transformed "the meaning of life without formal citizenship in the city" and altered the "exclusivity of urban citizenship" (p. 241). Unfortunately, even these communities came into being because of state exclusion. Many of the transients would prefer official residency, which would allow them to send their children to good schools on the cheap and entitle them to other benefits.

Solinger concludes that China has so far seen no unilinear relationship between commercialization and democratic institutions. One wishes that she were more forceful in discussing the dynamics for change in the future. Also, she might have given more attention to how changing population dynamics, including negative growth rates in some cities, and the Chinese government's emphasis on technological development may affect the patterns of migration. Nevertheless, there is no better book than this for readers who want a single volume that underscores both the dynamics and ambiguities of Chinese reforms.

All in all, both books deal admirably with institutions and dynamics in the process of transformation in China. Readers from multiple disciplines will profit from reading them.

China's New Business Elite: The Political Consequences of Economic Reform. By Margaret M. Pearson. Berkeley: University of California Press, 1997. 217p. \$35.00.

Suzanne Ogden, Northeastern University

Margaret Pearson addresses a key question in the field of comparative developmental politics: the relationship between economic reform and political change. Her focus is on the role of business elites in bringing about political change. Although the book is in large part a case study, based on interviews in 1991 and 1995 with members of China's new business elite (notably, Chinese managers in the foreign sector and private entrepreneurs), its conclusions are based on Pearson's substantial knowledge of China and theories of developmental politics. She examines how these two key components of China's mushrooming business elite have reshaped state-society relations. Among her major conclusions are, first, that China's economic reform has in itself been insufficient to bring about political reform, specifically, a change in the relationship between state and society, and,

second, that rather than become part of a "civil society," China's business community is best conceptualized as working within a hybrid framework of "socialist corporatism" and "clientelism."

Pearson notes that China's new business elite does not necessarily perceive political reform, especially democratization, as in its interests. That is one reason this group has not forced political change, although it is in the best position to do so. Despite continuing economic liberalization, clientelism and corporatism seem to work better for this elite than the creation of a "civil society." Pearson acknowledges that the concept, which developed in reference to the sort of bourgeois society that emerged in Western Europe during the seventeenth and eighteenth century, is of questionable relevance to a reforming socialist state such as China in the twentieth century. She uses the term "civil society" to refer "to the emergence of a realm of activity outside and independent of the hegemonic communist party state" (p. 26).

According to Pearson, China's business elite has little interest in becoming an activist political community and building a civil society. Its members tend to be apolitical. They try to satisfy their own narrow business interests through clientelism: building personal relationships (guarva) with officials through gifts and favors (although Pearson rightly notes that most forms of clientelism in China do not involve illegality). Indeed, foreign firms operating in China realize the necessity to work with the state and develop "relationships" with officials in order to improve their business conditions. Participation by officials is not viewed as an obstruction to economic growth but as essential to its success. As a result, foreign firms often put key Chinese officials on the board of directors or high in management in order to use their connections and influence. For its part, the state does not try to eliminate clientelism, because it allows the state to satisfy the individual interests of members of the business community, thereby preempting any need for the latter to engage in activist, confrontational activities against the state.

The reliance upon clientelism and socialist corporatism results in large part from deeply embedded cultural attitudes and practices. Yet, the fact that culture continues to play such an important role has led to a cycle of cause and effect: Weak horizontal connections among the business elite reinforce traditional business practices. Furthermore, clientelism and socialist corporatism have been strengthened by the aversion to politics as a result of 30 years of campaigns, criticism, self-criticism sessions, and class struggle; a belief that the present communist party regime provides the stability, law, and order necessary for economic growth; and the view of businesspeople that lobbying is unlikely to lead to change in national economic policy. Because China's marketization is incomplete, moreover, businesspeople are still dependent on local officials, who retain some types of authority and control and do not hesitate to use "discretionary favoritism" in allocating resources and protection. So, rather than build business associations to lobby governmental agencies and offices, the business elite has strong incentives to cultivate personal ties with local officials in order to address their own sector's or enterprise's narrow needs and to affect the distribution of those resources still in the hands of the state. "Distributing goods in response to personal requests diffuses societal energy rather than concentrating it; it allows the state to buy off discontent short of a point where such discontent might foster organized lobbying or opposition" (p. 143).

Pearson notes that the new business elite has so far proven unable or unwilling to free itself from China's deeply embedded values and traditions concerning how the private should relate to the public and the society to the state. Indeed, it is

ironic that the business community, once economic decentralization and marketization gave it significant structural autonomy from the state, systematically went about reestablishing informal ties to the state by cultivating relationships with officials. Pearson finds the roots of the hybrid pattern of socialist corporatism combined with clientelism in Confucian thought, in the history of merchant-state relations, in prerevolutionary China, and in socialist China, but she never uses the term "political culture" to describe the source of this continuity between pre- and post-1949 China. She implicitly recognizes, but never states, that China's political culture has survived the demise of the imperial state, as well as the collapse of republican and socialist institutional forms, such as a centrally directed economy. China's traditional political culture is a key to understanding why the business community persists in its old habits of relating to the state instead of attempting to create a civil society. In short, Pearson could well have concluded that culture has as much, it not far more, to do with the pattern of society-state relations than does socialism.

Pearson may be correct that if the well-positioned new business elite does not bring about radical political reform, then no other economic group is likely to do so. But the entrepreneurial managers of town and village enterprises (TVEs), whom she dismisses as too conservative and not well positioned to force political reform, should not be overlooked; in local elections, the party is most likely to nominate, and villagers are most likely to elect, candidates who have successfully established or managed TVEs. Those who are elected gain greater power to challenge the basic society-state relationship, but this group is likewise bound by political culture to work with the state, not against it.

Pearson examines the state-created business associations, which represent the new elite but are dominated by retired officials, as part of the state's effort to coopt potentially autonomous social forces. Here, again, she notes that this is not a one-way relationship. Business benefits from the linkages of these officials to government bureaucracies because they give members access to "the vertical, informal clientelism embedded in these associations" (p. 135).

Pearson makes an important contribution to our understanding of the relationship between political culture and the development of civil society. Elements that in another cultural context might lead to the creation of a civil society tend to be quickly absorbed in China into a culturally rooted clientelism and socialist corporatism. As a result, the state's corporatist strategy is to encourage business to support economic development while restricting its political role. At the same time, the business elite has been allowed considerable financial success for its cooperation.

Pearson concludes by putting China into the East Asian context. Once she asserts that clientelism in China is far less functional for the purposes of development than elsewhere in East Asia, she is left with the difficult question of explaining China's ability to produce growth comparable to such East Asian states as Japan and Korea. It is beyond the scope of her book to address this question fully, but her partial conclusion may tell us much about the success of the "Chinese model." In her estimation, local officials in China may have acted as "corporate directors" for their localities, and the central state may not have interfered with "neophyte business entities in business, agriculture, or local government" (p. 158) as much as one might assume. In short, beneath a cloak of communism there beats a capitalist heart in many local Chinese officials, who have encouraged economic growth within the hybrid form of clientelism and socialist corporatism.

Pearson's book adds an important dimension to our un-

derstanding of how China's communist regime has been able to maintain broadly based support as it liberalizes the economy. Deeply entrenched cultural attitudes and practices predispose the new business elite to cooperate with the regime in a clientelistic pattern, a predisposition that is reinforced by socialist corporatism. It will take far more than the disappearance of communism or the creation of a multiparty system to eliminate this mutually beneficial hybrid pattern.

Islamic Political Culture, Democracy, and Human Rights. By Daniel E. Price. Westport, CT: Praeger, 1999. 221p. \$59.95.

Shahrough Akhavi, University of South Carolina

Does "Islam" cause authoritarianism? Samuel Huntington claims it is antidemocratic (*The Clash of Civilizations*, 1996). Daniel Price begs to differ and concludes that it neither undermines nor supports democracy and/or human rights. Actually, it was Ann Mayer who in 1991 argued that Islamic values can be marshaled on behalf of human rights schemes but that male Muslims have interpreted these values in a way adverse to such rights (*Islam and Human Rights*, 3d ed., 1999).

Price, who ignores Mayer—although he lists the first edition in his bibliography—uses a simple typology, following William Shepard ("Islam and Ideology," International Journal of Middle East Studies 19 [August 1987]: 307-36). The key concepts are "comprehensiveness," the degree to which the shari'ah (Islamic law) is applied, and "authenticity," the extent to which non-Islamic values are permitted to influence society. Operationalization of comprehensiveness is based on whether Islamic law "is used" (p. 145) in the following domains: (1) personal status; (2) economics; (3) social customs; (4) crime and punishment; and (5) governance. If shari'ah is not applied, then Price assigns a zero. If it is applied exclusively, then he assigns a three. Between these extremes are cases of modest and major use, which merit a two and three, respectively.

By contrast, the scale for authenticity ranges from 0-15: 0-2 represents a society in which non-Islamic ideas, institutions, and technologies [sic] are accepted without reference to Islam; 3-5 means they are accepted by rationalizing their compatibility with Islam; 6-8 is a society in which they are accepted but believed enhanced by Islamic ones; 9-11 means they are accepted, but Muslims make efforts to "trace their roots in Islam" (p. 146); 12-15 means they are rejected.

Leaving aside the asymmetry of the 12–15 category (the ordinal range is four as opposed to three in the other four categories), there is no clarification of the difference between rationalizing the compatibility of non-Islamic ideas and institutions, on the one hand, and "trac[ing] their roots in Islam," even though these two categories are on opposite sides of the intermediate position on Price's spectrum.

Price is aware of the difficulties encountered in assigning numerical scores to societies' performance on these dimensions, which in the final analysis are based on "guesstimates." Turkey gets a one on authenticity, and Senegal gets a "three or four" (p. 146). The decision as to what score to accord a society comes down to interpreting the evidence contained in leaders' statements and speeches; scholarship on the political systems involved; constitutions; media reports; information generated from these states' embassies in the United States; the author's personal contacts in these states; and survey questionnaire responses by members of the Middle East Studies Association of North America. Price then seeks to

collate and distill the data generated by all these sources into quantitative integers, which is a daunting task at the least.

Four descriptive chapters discuss Egypt and Jordan, Syria and Tunisia, Saudi Arabia and Morocco, and Algeria and Iran. Another fifteen Muslim states are included in the statistical analysis. The relationship between Islam and democracy is mediated by seven variables, four of which, because difficult to quantify, are excluded from the regression analysis. These four are historical influences, regime strength, regime strategy, and the strength and orientation of Islamic groups. The remaining three are quantifiable: modernization, presence of social cleavages in society, and the presence of a minority religious group. Among Price's hypotheses are: (1) an inverse correlation exists between the presence of politicized cleavages and democracy; (2) there is an inverse correlation between the existence of a minority religious group and democracy; (3) a curvilinear relationship exists between the degree of a society's "wealthiness" and democracy (beyond a certain threshold of wealth, the relationship becomes inverse); (4) the more rapid the economic change occurring in a society, the less democratic it will be; and (5) a positive relationship exists between the level of social mobility in a society and democracy.

After his statistical runs, Price concludes: "I have provided evidence in support of the argument that Islam is not a monolithic political force that is the primary cause of political outcomes in predominantly Muslim countries" (p. 177). When control variables are placed into the mix, the relationship between Islamic political culture and authoritarianism becomes insignificant.

To all this one can only say "amen." Should we be surprised? After all, a moment's reflection will reveal diversity in the social, economic, and political processes and institutions of contemporary Muslim states. Because of these variations, one may not logically use the constant of "Islam" to explain authoritarianism in these systems. If "Islam" were the culprit, then the polities of these systems would be characterized by uniformity. Price is to be commended for the industry he brought to the task of making sense of Islamic political culture, but such labors appear to have yielded a finding that is predictable on theoretical grounds.

The book contains a number of errors in grammar, syntax, orthography, and occasionally even substance. An example of this last is the statement that Islamic law "was finalized over eight hundred years ago and has not been significantly altered since" (p. 24). In fact, the *shari'ah* continues to evolve, in part because one of its sources is the opinion of jurists. In earlier periods, the juristic principle of *maslahah mursalah* (public interest) was scarcely known, but in the last two centuries it has been elaborated in a way as to be undoubtedly unrecognizeable by earlier jurists, including the Caliph 'Umar ibn al-Khattab (d. 644) or Malik ibn Anas (d. 795), al-Juwayni (d. 1085), al-Ghazali (d. 1111), or Najm al-Din al-Tawfi (d. 1316).

Other mistakes include Price's assertion that the Prophet Muhammad's second wife was a merchant (p. 25). Populace is rendered "populous" (pp. 27, 30). The transliteration of the word for a Christian or Jew (protected people in Islam) is given incorrectly as *dhummii* (it should be *dhimmi*); we get the expression "quranicaly justified" (as opposed to Qur'anically justified); and the two early dynasties in Islam are spelled Abasaid and Ummayid (the correct forms are 'Abbasid and Umayyad). (All these mistakes occur on p. 28, and *dhimmuni* is repeated on p. 148.) In comparing Islam in Morocco and Algeria, Price tells us that "political Islam has taken a much less virulent form in Algeria," but surely he means in Morocco (p. 34).

In the bibliography Price errs in claiming 1986 to be the

date for Shepard's article (it is 1987); reverses the dates of publication of the two works by Piscatori; misattributes Vatin's essay on puritanism and reform in Algerian Islam to Piscatori's 1986 work, Islam in a World of Nation States (Vatin's essay appeared in Piscatori's 1983 edited volume, Islam in the Political Process); and misspells a variety of author names and terms: "Phanatos" (correct: Thanatos), "Ahkavi" (it is Akhavi), "Mahkzen" (it is Makhzen), "Mattadeh" (it is Mottahedeh), "Tahari" (it is Taheri), "Tibbi" (it is Tibi), and so on.

Popular Movements and State Formation in Revolutionary Mexico: The Agraristas and Cristeros of Michoacán. By Jennie Purnell. Durham, NC, and London: Duke University Press, 1999. 271p. \$49.95 cloth, \$17.95 paper.

Neil Harvey, New Mexico State University

Jennie Purnell's detailed historical analysis of rural conflict in Mexico in the 1920s sheds new light on the formation of political identities in the context of revolutionary state formation. The book is well written and provides new material on the comparatively understudied cristero rebellion of 1926-29. Drawing on the experience of three regions of Michoacán state in Mexico's center-west, Purnell traces divergent responses to two main elements of postrevolutionary politics: radical agrarianism and anticlericalism. The author's concern with local histories is prompted by her dissatisfaction with structuralist analyses that tend to assume fixed interests and identities of social agents due to their economic position. Purnell also rejects new social movements theory as an inadequate framework for analysis. In explaining why some peasants supported the goals of agrarian reform and anticlericalism while others took up arms against such policies, Purnell focuses on how historical legacies of local conflict were politicized in new ways during the 1920s as the postrevolutionary elites sought to consolidate national government and reshape cultural identities.

For Purnell, the contours of state power emerged from myriad local and regional histories of negotiation, accommodation, and resistance. In this respect, Purnell clearly locates her work within the recent literature in Mexican studies on everyday forms of state formation (the title of a 1994 volume edited by Gil Joseph and Daniel Nugent, which include essays by James Scott and Derek Sayer). In this sense, Purnell takes aim against both orthodox and revisionist understandings of revolutionary state formation in Mexico. The former tend to view the state as representing the popular will, and the latter claim that the new state was able simply to impose its centralized authority on a passive society. For Purnell, state power is not seen in terms of the successful centralization of authority in the capital city (expressed by the notion of "Leviathan on the Zócalo"). Instead, it is the contingent result of conflictive processes of resistance and negotiation that take place in a great variety of local and regional contexts, where what is at stake is not national power but local understandings of political authority, religious practices, and property relations.

The book is divided into eight chapters. The first lays out Purnell's argument in favor of the nuances of local histories, promising a very descriptive but also analytically perceptive text. Chapters 2, 3, and 4 provide relevant historical contextualization of local resistance to nineteenth-century liberalism and (early) twentieth-century state formation. In this way, Purnell connects longer term processes of identity formation with the cristero rebellion. Her original, empirical research, carried out as part of a doctoral dissertation, is

concentrated in the following three chapters, which compare how rural communities engaged with the state in three subregions of Michoacán. The concluding chapter repeats the book's main arguments and places the study in the context of other antistate movements in early-twentiethcentury Mexico. She also provides an alternative explanation for the sustained support for the cristero rebellion in the center-west region of Mexico. Rejecting structuralist and other analyses, Purnell argues that cristero support was strongest when three elements were present: Communities had survived liberal reforms with a relatively intact land base; a dense network of Catholic organizations existed at the grassroots level; and there were particular experiences of state formation in the 1920s, especially the association of centralized power with state-managed agrarian reform and state-sponsored anticlericalism.

Purnell's study will be particularly welcomed by specialists in Mexican political history. The depth of archival research is impressive, and the book makes a coherent case for more microlevel studies that may challenge existing scholarly and political understandings of postrevolutionary Mexico, particularly the critical formative years of the new state in the 1920s. The book will have a harder time attracting other audiences in political science. The author makes only a limited attempt to locate her work in broader scholarship of interest to comparative politics or political science more generally. Theoretical discussion tends to be limited to debates among historians of the Mexican Revolution, with only passing reference to comparative study of peasant rebellions and state formation. Purnell is too quick to dismiss theories of identity formation that she associates with "new social movements" theory. I presume that she means poststructuralist theories, which can and have been applied to the study of political identities in many historical and geographical settings (e.g., Aletta Norval, Deconstructing Apartheid Discourse, 1996; Ernesto Laclau, ed., The Making of Political Identities, 1994). Postcolonial theories and subaltern studies are not mentioned, despite some close affinities. Even more mainstream scholarship in comparative politics receives little or no attention (e.g., the "state-in-society" approach developed in Joel Migdal et al., State Power and Social Forces, 1994).

The limited discussion of theoretical alternatives is also flawed. For example, Purnell claims that new social movements theory believes that identities are "almost completely divorced from economic structures and political institutions" (p. 182). This cannot be the case, since those movements that have been categorized as "new" (peace, feminist, ecological, ethnic, and so on) are, to my knowledge, conceptualized as responses to transformations in the economic, political, and cultural realms of contemporary societies. That they are not reducible to economic interests or political institutions is not so different from Purnell's own arguments for a more historically contingent and relational understanding of popular mobilization. Similarly, structuralist approaches are presented in their most extreme, deterministic form, which omits the development of more contextually specific approaches to the constraints and opportunities for collective action.

In sum, this book provides more support for the postrevisionist synthesis in the history of revolutionary Mexico. Yet, it does not address either the theoretical and empirical problems with this approach or the broader developments in the study of state formation and popular movements.

Nihil Obstat: Religion, Politics, and Social Changes in East-Central Europe and Russia. By Sabrina P. Ramet. Durham, NC: Duke University Press, 1998. 424p. \$69.95 cloth, \$23.95 paper.

James W. Warhola, University of Maine

Sabrina Ramet has supplied the scholarly community with yet another excellent, meticulously researched work dealing with politics, religion, and social change in the contemporary world. The book details the symbiosis of church-state relations in a remarkably broad scope of religious orientations across a daunting range of national contexts, including Albania, Bulgaria, the Czech Republic, the former East Germany, Hungary, Poland, Romania, Russia, Slovakia, Ukraine, and the former Yugoslavia. Eight chapters devoted more or less to individual country studies compose sections 2, 3, and 4. These are preceded by an opening section, "Cross-Regional Overview in Comparative Perspective," and followed by a concluding section, "Postcommunist Trends and Conclusion." Six of the 14 chapters appeared in print in earlier versions. These were expanded and developed to reflect changes in the countries under consideration and to provide coherence to the book; both objectives were successfully accomplished.

Substantial treatment of church-state relations before, during, and after each country's respective experience with a Marxist-Leninist regime is provided within the framework of the profoundly insightful chapter 2, "Phases in Communist Religious Policy." Much of the analysis is undertaken from the perspective of the "symbiosis of religion and politics" rather than a one-directional dynamic of either the state shaping and determining religious affairs or of one or another religious group affecting the policies and practices of the state. Thus, the work provides a highly useful and necessary addition to the massive body of scholarly literature on church-state relations, much of which either gives short shrift to this symbiotic dynamic or simply neglects it altogether. Also, chapter 12, "Mores Ecclesiae et Potestas Fidei: A Contrast of the Bulgarian Orthodox Church and the Polish Catholic Church," is a model of comparative scholarship on religion and politics at its best.

Documented evidence derived from numerous language sources is adroitly provided from nearly every major language of Eastern Europe as well as Italian and German. Errors of fact, or questionable assertions, are minimal and rather inconsequential. Former Ukrainian President Leonid Kravchuk's name, for example, is inconsistently transliterated (Kravchuk until the second half of p. 257, thereafter Krawchuk); referring to Abkhazia as one of "other countries" (p. 271) seems premature at best, given the status of this region of Georgia at the date of publication; and more than a few historians would surely dispute the claim that the "persistent tendency of Christian religions" to "anathematize homosexuality" has been occurring only "since the twelfth century" (p. 333).

Two characteristics of this work might be viewed as weaknesses but strike me more as implicit invitations to further research needed in the general area of religion, politics, and social change. First, although the work successfully and emphatically underscores the significance of the symbiosis of religion and politics in the governance of a society, the volume represents more a chronicle of the entire region's experience in this regard than a deep, comprehensive consideration of the phenomenon of religion and its place in sociopolitical transformation in the modern world. Perhaps limitations of space precluded such consideration. Yet, one does not need to subscribe fully to modernization theory, for example, to appreciate that the role and place of

religion in the symbiosis of church-state relations has undergone dramatic transformations in literate as opposed to preliterate societies, or in societies characterized by the very social infrastructures that both enabled political totalitarianism and ultimately undermined it (e.g., modern mass communications and transportation). One also might argue that the symbiosis of religion and politics characteristically undergoes profound transformation in societies in which the level of industrial development has dramatically altered patterns of livelihood and consumption, thereby casting such questions as property, wealth, status, and social responsibility of economic powerholders—all of which have clear and direct religious implications—into bold political-theoretical relief. Aside from largely coincidental treatment of this aspect of the symbiosis of state and religion in the otherwise excellent and incisive chapter 2 and in the all-too-brief chapter 14, the volume leaves to future researchers the further exploration of the connection between modernization and change in church-state relations since the collapse of the communist regimes in the region.

Second, the philosophical questions addressed by the author in the concluding chapter are useful and necessary. Given their gravity, however, the work would have benefited from a much more lengthy exploration than that offered. That which Dr. James Wood, founder of the Journal of Church and State, refers to simply as "the existential reality of religion" has the most far-reaching and profound social and political implications, and Ramet does well to address these in chapter 14 in terms of the irreducibly political questions of social identity, public morality, and human purpose. The scope and depth of treatment, however, does not match the sharp and deep insight into the regional chronicle of religion and politics offered in this volume. Despite the constraints of space in what is already a very substantial volume, one finishes this book with the sense that the final chapter deserved more than the profound but scant six pages allotted, particularly given the author's demonstrated acumen.

It has been suggested that the communist regimes in Eastern Europe and the former Soviet Union ultimately found themselves at war with all three transcendental values: truth, beauty, and goodness. As such, the title Nihil Obstat ("nothing stands in the way") might have been offered as testament to the social dimension of "the existential reality of religion," even in the face of explicit and powerful attempts to eradicate it, and not just to indicate that now, after the collapse of these regimes, "nothing stands in the way" of the vitality of religion and its role in public life (p. 3).

Nihil Obstat is a remarkable scholarly work of encyclopedic scope, from the former East Germany, to the curious case of Albanian society's religious tolerance (p. 220), which contrasts so sharply with the fanatically antireligious communist regime of 1945–89; to postsoviet Russia and Ukraine, whose highly complex and troubled configuration of religious forces is handled deftly and evenhandedly. This book is essential reading for those studying the interaction of politics and religion in the contemporary world, and it appears destined to shape the contours of subsequent research on politics and religion in this region

Deepening Democracy? The Modern Left and Social Movements in Chile and Peru. By Kenneth M. Roberts. Stanford, CA: Stanford University Press, 1998. 370p. \$55.00 cloth, \$19.95 paper.

Gerardo L. Munck, University of Illinois at Urbana-Champaign The Left in Latin America has changed in many ways from the days of Che Guevara and Salvador Allende. Its revolutionary aspirations were dashed preemptively by repressive military regimes that swept the region in the 1960s and 1970s and were short lived in Nicaragua. Even in Cuba, where Castro remains in power, the retreat from the ideals of the 1960s is remarkable. In short, today even the old choices between capitalism or socialism, dependency or revolution, have lost much of their force as points of reference in the definition and formation of the Left.

In the context of democracy and neoliberalism in the 1990s, the re-formation of the Left hinges on a much more complex choice. Defining the Left as those who seek an alternative to neoliberalism is easy enough. But, as Roberts argues with clarity and force, the problem is that those seeking an alternative to neoliberalism face a tough decision: whether to search for an alternative to neoliberalism within or outside the institutional framework of democratic regimes. which highlight the electoral process above all else and which have perpetuated the antipopular demobilization strategy of the previous military regimes. In other words, the current context presents the following dilemma for the Left: The support of democracy, which in the wake of repressive regimes has become more valued, may actually forestall the constitution and action of the very actors who would have a stake in an alternative to neoliberalism.

The effect of this choice on the evolution of the Left has been profound. Initially, different responses to it led to a split between moderate and orthodox tendencies in countries such as Brazil, Chile, El Salvador, Nicaragua, and Peru. Thereafter, the political successes of the moderate Left strengthened the reformist tendencies within the Left. Thus, by the late 1990s, the process of formation of a democratic Left was well under way. But inasmuch as the democracies the Left was now supporting had been made safe for elites, the Left had become more democratic than leftist. Ironically, it had not been fully committed to democracy in the 1960s, at a time when the existing democracies were susceptible to popular mobilization, but in the 1990s was a key supporter of democracies that were overwhelmingly conservative.

This problematique, of vast implications for the future of Latin America, is at the heart of this very insightful book. It starts by laying the groundwork for the empirical analysis. The Introduction and the first two chapters discuss the context within which the recent evolution of the Left in Latin America should be understood. These chapters then present a set of explanatory variables focused on two questions: why the Left responded to the choices it faced as it did and why the demobilization of the Left has been so pervasive. The next five chapters advance the analysis through a study of two cases: Chile and Peru. These chapters are structured both in terms of chronological time and the book's key questions.

The choice of cases has a solid rationale. These two cases not only are of great intrinsic interest but also, as Roberts shows, are useful in thinking about Latin America more broadly because they illustrate the two most clear-cut responses to the choice faced by the Left throughout the region. The Peruvian case demonstrates how the failure to adapt to the new institutions of democracy can lead to obsolescence. In this case, although the United Left looked like a formidable electoral force in the mid-1980s, the failure of this coalition to agree to give primacy to an electoral strategy, along with the Shinning Path's continued pursuit of change via armed action, led to the utter collapse of the Left as a viable force.

In contrast, Chile demonstrates the implications of the choice to accept and defend democracy. It shows how leftists willing to undergo a process of moderation—the socialists—

can grow in strength, take advantage of the growing marginalization of leftists who refuse to accept the institutional framework of democracy (the communists), and even accede to power, as did the socialists, who have been a main bloc of Concertation, the governing coalition since 1990. But, as Roberts argues, if the contrast between Peru and Chile shows that the path of moderation seems to be the only one that leads to the successful re-formation of the Left, then the case of Chile also shows how success via moderation has its own costs. Indeed, being part of a governing coalition has done little to allow the socialists to steer policies toward some alternative to neoliberalism. (At this time-July 1999-we can only wonder whether Lagos, the leader of socialists and presidential candidate of Concertation will win and, if so, whether a Lagos administration will lead to a different assessment of this question.) Thus, these two cases do much to capture the dilemma currently faced by the Left in Latin America.

Some critical points might be raised in assessing this book. For example, the analysis of the cases could have been more systematically driven by the explanatory factors presented at the outset. Along these lines, although Peru and Chile are compared sometimes, the separate presentation of the cases makes the analysis less explicitly comparative than it could be. Moreover, a discussion about how the analysis could be extended to other cases would have strengthened the argument. But these points should not detract from the book's achievements. Roberts not only brings to bear on his analysis a clearly formulated set of explanatory factors but also advances a very complex and compelling argument. Indeed, because he relies on data that are very detailed and hard to collect, in particular about actors and their strategies, he does a masterful job of articulating nuanced causal arguments that weave together structural, institutional, and choice-based factors.

In sum, this book makes an important contribution. It offers a broad picture of how Latin America is changing and, specifically, how masses and political parties not only are responding to but also shaping a new social and political order. It is a worthy addition to a growing body of literature on Latin American social movements and politics, and it should be read and studied not only by those who are concerned with the evolution of the Left but also more broadly by those who are interested in understanding the travails of current Latin American democracies.

Building Social Capital in Thailand: Fibers, Finance, and Infrastructure. By Danny Unger. New York: Cambridge University Press, 1998. 227p. \$59.95 cloth, \$19.95 paper.

Ansil Ramsay, St. Lawrence University

From the late 1950s until the late 1990s Thailand had one of the best records of economic growth among all less-developed countries. Danny Unger uses a social capital approach to explain why Thai political leaders adopted the market-oriented development strategy that initiated the period of growth, and why ethnic Chinese entrepreneurs were so effective in taking advantage of the strategy. His analysis begins with the assertion that social capital, defined as cooperative groups "within which individuals can reach compromises and foster shared understandings of common problems," is very unequally distributed between ethnic Thais and the ethnic Chinese minority (p. 2). Thais tend to have a low level of social capital, and Chinese tend to have a high level.

From this beginning Unger moves to an explanation of how low levels of social capital among Thais contributed in significant ways to the adoption of market-oriented development strategies in the late 1950s. They did so in part because lack of social capital weakened state officials' capacity to work effectively with groups outside the state to promote economic development. This made it easier to rely on market-oriented strategies that did not require close cooperation between state officials and representatives from the private sector (p. 10). In addition, the inability of Thai officials to cooperate led to intense competition among political leaders and the need to find resources to fund this competition. One major source was the Chinese business community, which was supportive of market-oriented policies. Finally, the new leadership that came to power in the late 1950s was able to adopt such policies because of the absence of distributional coalitions capable of blocking the shift.

The new development strategy brought quick results because of the vigorous response of ethnic Chinese entrepreneurs to market incentives. This response was more the result of their "capacities for cooperative undertakings" than any innate capacity for thrift, hard work, or patience (p. 51). The ability to cooperate enabled them to overcome market failures and collective action problems that stemmed, in part, from the ineptness of the Thai state. In short, Thailand's successful economic performance was the result of "a serendipitous match of Thai and Chinese social capital endowments" (p. 175). The first three chapters of the book are devoted to developing this argument and sketching out the main features of the Thai political economy.

That and Chinese social capital endowments help explain the overall pattern of That growth, but there has been considerable variation in patterns of interaction among state agencies and private firms in different economic sectors. The middle three chapters of the book present a sophisticated comparative analysis of patterns of interaction in three economic sectors: finance, textiles, and infrastructure for heavy industry and transport. Unger suggests that four structural variables account for the variation: "the number of firms and state agencies involved, the number of times and length of time over which firms and agencies meet in order to cooperate, the degree to which they can share among themselves the gains they achieve, and the number of times such gains recur" (p. 7).

Unger does not devote a great deal of space to the economic crisis of 1997 and its aftermath, but he does discuss the ways in which the lack of cooperation between public and private agencies contributed to growing economic and financial difficulties in the 1990s. The author finds evidence, however, that cooperation began to improve in the 1990s, "both in the private sector and in the broader civil society," and that Thai officials began to be more effective in cooperating with the private sector (pp. 177–9).

This is an important work that has the additional merit of being written with great clarity. Much has been written about rapid economic growth in Thailand as well as other Asian countries. This literature is dominated by political economy explanations. Unger offers an alternative. He does not claim to have discovered a Rosetta Stone that completely explains Thai success, and he draws on literature on collective action, state embeddedness, and institutions as well as on literature on social capital. He argues, however, that the social capital approach provides "new ways to understand the Thai economic record" (p. 5).

Unger makes a strong case for this claim, but skeptical readers are likely to challenge him in at least three ways. First, how much does the social capital approach add to our understanding of Thai development success and difficulties? One of the author's main claims is that the approach adds to our knowledge about why Thai leaders adopted a market-

oriented strategy in the late 1950s, but he points out that a number of factors help explain their choice. These include the failure of past state-led policies, the desire of Field Marshal Sant Thanarat to undermine opponents whose bases of power were in state enterprises, and pressures from the United States. Unger uses the social capital approach to suggest that, in addition to these reasons. Thai leaders were able to make the transition to a new market strategy because Thailand's legacy of social capital left it without organized groups capable of resisting the change. Yet, it is possible to explain the absence of such opposition without using the concept of social capital. There was little industry in Thailand in the 1950s, either private or state owned, and therefore no large or strong base among industrialists to oppose liberalizing policies. Trade unions were small and easily suppressed by military governments. The ethnic Chinese minority who dominated trade and finance were very vulnerable politically.

Skeptics will also find it possible to challenge the assertion that market-oriented policies worked so well because the rich accumulation of social capital among ethnic Chinese enabled them to overcome various market failures and collective action problems. To make this argument fully convincing would require not only a systematic account of the kinds of market failures and collective action problems that were the greatest threats to sustained economic development but also specific analyses of how the ethnic Chinese drew upon their social capital to overcome them. The book does not have such an account.

Finally, one can challenge such blunt assertions as "Thats did not readily participate in continuing cooperative groups beyond the family" (p. 168). There are clear exceptions to such assertions in both the state and private sector, where Thats have demonstrated high levels of cooperative behavior over long periods. The Bank of Thailand is an example from the state sector, and Siam Cement is an example from the private sector.

These challenges do not diminish the significance of the book or the author's accomplishment. They do point to areas in which future researchers, using the social capital approach to explain development in Thailand and elsewhere in Asia, can build upon Unger's achievements.

Institutions and Institutional Change in China: Premodernity and Modernization. By Fei-Ling Wang. New York: St. Martin's, 1998. 227p. \$65.00.

Peter R. Moody, Jr., University of Notre Dame

For the past generation, after the rejection of Maoism, the Chinese leadership directed its policy to the "four modernizations." Fei-ling Wang, however, comments on how "barren in terms of theoretical construction" (p. 5) this discussion of modernization has been, whether by the Chinese authorities themselves or by those who study and interpret them. Wang is dissatisfied with even the more theoretical political science studies of modernization and hopes his work will offer an improvement.

He has his own definition of modernization: "the institutional changes toward the optimization of the human institution with a particular form of the human institution—modernity—as its identifiable goal." This is less tautological than it might appear on quick reading. Modernization involves changes in institutions, and Wang, unlike most theorists, has an explicit picture of what modernity might mean as a goal. Modernization is the process of institutional change leading toward modernity. The puzzling term "the [the!] human institution" seems to refer to the ways human beings

live with one another, and modernity apparently is the best (optimal) form this human institution can take. The human institution is itself a compound of three institutions: the polity, the economy, and society. If this is supposed to embrace all of human life it may omit several important dimensions—the aesthetic, the moral, the spiritual, the realm of personal attachments and affections—but perhaps these are not particularly relevant to achieving modernity. Modernity entails democracy (an effective, stable, and participatory "nation-state"—this last term might be somewhat problematic), a market economy, and a civil society (pp. 7-20). Wang is not very interested in the modish notion of postmodernity. This is either a further development along the lines of modernity or a deterioration from it. Wang says that modernization is not the same thing as development and that modernity is compatible with any level of development. One might think, however, that the modern society Wang has in mind will turn out to require a rather advanced technological base.

Wang proposes to study modernization through changes in what he calls labor allocation patterns (LAPs). China is an instance of "the [the!] traditional LAP" (p. 62). (Wang's analysis is rather more nuanced than this trick of style implies, and his promiscuous use of the definite article does not mean that everything within a certain category is exactly like everything else.) China has been a "superstable" society with a family-based LAP and an authoritarian state dominant over society. Communism did not break this pattern but reinforced it. It is only recently, with the liberal economic reforms, that China has begun to modernize, particularly with the evolution of a market-rational labor system, at least at the local level, what Wang calls "community based labor markets" (CLMs) (p. 68). Those whose sense of humor ceased development in the seventh grade might suggest an alternatrve abbreviation, CLAPs, in homage to the prominent role of "sex workers" in China's emerging market economy.

Wang's characterization of China's society is probably not "wrong," in that everything in the world is in some sense like everything else, and there are significant continuities between "traditional" and Maoist China and differences between these and the period since 1978 or 1992. His model is particularly helpful in understanding the current transformations It probably cannot serve as an accurate description of Chinese society throughout the ages, not so much for what it asserts but for what it omits. It ignores the role of commerce and the market at many different periods of Chinese history. It does not acknowledge that many of the current developments were under way during the republican era. It contains no means for easy accommodation with contradictory, equally persuasive conceptualizations of Chinese reality. A generation ago, for example, it was a scholarly commonplace that communist China marked the definitive modernizing break from the past, and that those who saw continuities between Mao's China and old China were atheoretical smological windbags who probably should confine their attention to the classification of Ming vases. The results of much of the social change brought by reform look more like "traditional" China than China under Mao.

Another cut at the Chinese example may indicate that a family-based LAP may be compatible with modernity, and the focus on LAPs may leave important things unexplained. The old system of collective agriculture was rather explicitly designed, for example, to weaken the family-based LAP, in that workpoints were awarded to individuals, not to households. But the system seems to have done little to weaken the hold of the family over the individual (or, to phrase it another way, to damage family cohesion). Wang's introductory discussion of the CLM exaggerates the degree of market

rationality—although elsewhere he gives ample attention to the pathologies generated by the reform, including, perhaps surprisingly in a society ruled by a communist party, the evolution for the first time in China of a genuine proletariat on the nineteenth-century Marxist pattern.

The analytic model is itself interesting, even stimulating, although one can get the impression its logic has not been fully thought out. It seems to be a version of the old standard modernization theory, early David Apter, with a touch of Huntington. Wang says that institutions exist to satisfy human needs, with desires arising from needs. He also says, again, that modernity is a "goal." To call modernity a goal may imply there is nothing in the operation of social forces (or whatever) that spontaneously leads to modernity. But neither, it seems, should modernity as here conceived necessarily fit anyone's particular need. The Chinese rulers, presumably, would be completely happy with a prosperous economy, a closed political system, and a cowed society. Wang stresses (p. 33) that the modernization of the economy, polity, and society need not move in harmony with one another. He conjectures (without offering evidence) that America's demoralizing social problems come from excessive development of the market at the expense of political and social health, and he points to problems marketization may be causing Chinese society. This is not to say that Wang's notion of modernity does not have its appeal, but his theory is more normative than positive.

Wang purports to treat China as a natural social science laboratory, but there is evidence that he cares about the country for its own sake. His picture—communism as a continuation of a mostly dark tradition, with the hopeful and imperfect break coming only with the post-Mao reforms—is similar to that of the more radical reformers, with a hint of neoconservatism thrown in (Wang worries that democracy might weaken the capacity of the state). His thesis is attractive as a policy guide and generally compelling as an analysis of China's problems and prospects, but it works better as a contribution to political thought than to political science.

Unstately Power, Vol. I: Local Causes of China's Economic Reforms. By Lynn T. White III. Armonk, NY: M.E. Sharpe, 1998. 521p. \$69.00.

Unstately Power, Vol. II: Local Causes of China's Intellectual, Legal, and Governmental Reforms. By Lynn T. White III. Armonk, NY: M.E. Sharpe, 1998. 765p. \$45.00.

Joseph Fewsmith, Boston University

In two thick volumes, Lynn White explores the origins and implications of China's reforms across a wide spectrum of issues, encompassing everything from the economics of rural reform and the growth of local business; to the changing ideational complex of ideology, religion, the media, and the arts; through the changing role of the legal system and the selection of the political leadership. Unsatisfied with narrowly gauged explanations, White explicates the dynamic of reform through multiple overlapping and/or reinforcing arenas of social life. It is an extremely ambitious undertaking, reflecting prodigious scholarship and wide-ranging interests. White adopts such an ambitious research strategy because of his desire to overturn what he believes to be deeply engrained understandings about the hierarchical, top-down nature of the Chinese state and its relation to society.

The author sets out two broad but important research goals. First, he wants to break down the conventional (in China and the West) dating of reform from the Third Plenum in December 1978. For White, that was not an especially

important date; it was "less situational than normative" (vol. I, p. 12). It marked the rise of a new group of leaders at the center and hence a new historiography but not much else. White argues that China's reforms began when the Cultural Revolution ended, 1969 in his reckoning, or shortly thereafter. His emphasis on the emergence of reform in the early 1970s is closely related to his other major thesis, namely, that reforms have been a bottom-up process. Local networks—unstately power—have been the source of the reforms and of their continuation, and it is the rise of these local interests that is the real story of China's reforms.

White's emphasis on local networks and local interests builds on the same intellectual orientation that James Scott developed in Weapons of the Weak (1985) and Domination and the Arts of Resistance (1990). Indeed, White argues that "few" of China's reforms "served the long term interests of the central Party elite in Beijing," on the contrary, "the government over time tolerated and then legitimated such changes, because they could not be stopped" (vol. I, p. 15). In arguing this, White takes on what he perceives to be the dominant focus on Beijing and the leaders at the top.

This multitude of interests, which in the aggregate White believes have proved themselves more powerful than the Leninist party that rules them, makes up the local power in all the various dimensions that interest White. In calling these interests "unstately," White goes well beyond most students of China. There has been much interest in the field in recent years about the relations between central and local levels of government. White simply excludes the latter from the realm of the state ("The state is the central government elite whose glue holds" [vol. I, p. 19]), lumping, say, the City of Shanghai party and government organizations in with intellectuals, artists, business interests, and so forth. This tendency to conflate local political organizations, which do have responsibilities vis-à-vis higher levels of authority, with other and more informal interest networks captures one facet of political action (i.e., the way in which local political authority has to respond to, mollify, or control local interests), but it ignores the way they must respond to the central government as well.

Perhaps because White is fascinated by local networks and the interaction of many disparate variables to produce an outcome—growing local power—he never explores in systematic fashion the incentive structure that has increased the importance of local government or the differential effects of these incentives on different local interests. Although the author discusses briefly the 1979-80 tax reforms that gave localities incentives to develop their economies, and hence to support local interest, he does not exploit this insight in the systematic fashion of Jean Oi (Rural China Takes Off, 1999). Perhaps this is because White rejects the sort of rational choice approach Oi employs, but it seems that White's approach is driven more by his own ecumenical interests than by methods per se. Causality, in his opinion, is too complex to be reduced to incentive structures. That may be true, but one would hope for a little more guidance through the thicket of local interests explored here.

The relationship between central power and local interests in China has received much attention in recent years. White's emphasis on the importance of local interests puts him well within the mainstream of opinion. Indeed, it is difficult to understand the author's repeated criticism of those who look at central politics in Beijing. That fight has been won; the vast majority of scholarship today, as indicated by White's own bibliography, directs its attention away from elite politics (in this regard, the present reviewer is an exception). But in adopting the thesis that China's reforms have been driven

from the bottom up, White goes beyond what most people would accept and, I think, what the evidence will allow.

The classic example, which White discusses, is the origins of agricultural reforms (the so-called household responsibility system). White argues that this was entirely a bottom-up process. "Decollectivization," he argues, "was not an idea from Beijing; it came from local farmers" (vol. I, p. 96). This oversimplifies the reality. There was, of course, a basis of support for decollectivization among the rural population, just as there had been every year since collectivization was forced on them (see Edward Friedman, Paul Pickowicz, and Mark Selden, Chinese Village, Socialist State, 1991). But the change came in 1978 because some determined local leaders, most notably Wan Li, were courageous enough to push the change against both local and central resistance (which is not to say that Wan Li did not have significant local and central support; he was a close ally of Deng Xiaoping, and that relationship was critical to what he did in Anhui between 1977 and 1979).

This example suggests that central politics remains an important force in China, shaping (not determining) what happens at local levels. Indeed, in pushing the origin of the reforms back into the 1970s, White ignores the importance of what was going on at the center. One of the most important political changes in that period, to which White alludes in his references to the emergence of reforms in the early 1970s, was the death of Lin Biao after an apparent failed attempt to assassinate Mao Zedong. Lin's death, and the explanation provided to the Chinese people, set off shock waves across the nation. Mao brought Deng Xiaoping (purged in the Cultural Revolution as the second major capitalist proponent in the party after Liu Shaoqi) back into the leadership to stabilize the military and provide assistance to Premier Zhou Enlai, then suffering from cancer. Deng fought hard in those years to begin to restore rationality to the economic system, generating some of the reforms White discusses. Deng paid for his efforts by being purged again in 1976. The death of Mao and the arrest of the Gang of Four, which permitted policy adjustments under Hua Guofeng and paved the way for Deng's reemergence, were not trivial events.

More important than the origins of the reforms is their effect, particularly what they have meant for the central-local relationship. Despite the prodigious research and rich insights, White ends up asserting, rather than demonstrating, that the reforms have meant the decentralization of power. It is unfortunate that Yasheng Huang's powerful argument (Inflation and Investment Control in China, 1996)—that the central state has retained political power even as it has decentralized economic power—apparently came out too late to be taken into account. It goes right to the heart of the matter of how much power of what sort has in fact devolved to the localities. And Huang's answer is diametrically opposite that of White.

Moreover, White tends to focus so much on the local level that he ends up ignoring the central government. He misses an important, and still very much unexplored, story of how the reforms have reshaped both the localities and the central state through their mutual interaction and adjustment. In fact, the central state has acted to counter many of the trends White discusses, most notably in the tax reform of 1994. The erosion of state capacity in the 1980s has generated efforts to reverse those trends in the 1990s, and how successfully remains to be seen.

Many other topics are explored in these volumes, too many to discuss in a short review. Suffice it to say that White has engaged just about every significant debate in contemporary China studies. Such a work is bound to be controversial, as the comments above suggest, but by engaging such broad-ranging, important issues, White has done a real service to the field.

Peasant Revolution in Ethiopia: The Tigray People's Liberation Front, 1975–1991. By John Young. Cambridge: Cambridge University Press, 1997. 270p. \$59.95.

Ruth Iyob, University of Missouri-St. Louis

The author offers a much needed account of an ethnonational liberation movement that dislodged Ethiopia's Afro-Marxist regime after a seventeen-year guerrilla war (1975–91) and received international recognition and acclaim for its pragmatic and innovative leadership. John Young's focus on the Tigray People's Liberation Front (TPLF), which dominates the coalition government Ethiopian Peoples Revolutionary Democratic Front (EPRDF), provides the first scholarly attempt to analyze Ethiopia's second "revolution" of the twentieth century.

The author's thesis can be summed up as follows: The findings of major theorists of peasant revolutions minimize the role of the peasantry when the leaders are from the urban petit bourgeoisie. As a result, their theories do not accurately reflect the subtle ways in which peasantry's demands are addressed by the leadership and the myriad ways in which unaddressed or postponed demands permeate the postrevolutionary period. The book is divided into eight chapters. The research is based on field work and interviews collected over more than thirteen months. The title reflects the major difficulty of this work: a focus on critiquing theorists of peasant studies superimposed on Tigray's ethnonationalist movement led by the urban intelligentsia of the TPLF.

This cumbersome design forces the reader to maintain bifocal lenses, one aimed at the conditions of Tigray's peasants and the other on the origin, development, and policies of the TPLF. The author succeeds in bringing to light little known facts about the TPLF, but the not so well-defined peasantry recede to the background. Young glosses over the ethnographic grounding upon which the works of Eric Wolf, Joel Migdal, Jeffrey Paige, and James Scott rest, thus discounting the rich database that validates the inter- and intraclass definitions of categories. His reliance on the ideology-based categories in use since Ethiopia's first experiment with agrarian reform—subsequently adopted by the current regime—leads him to assert that extant theories of peasant revolution are "largely inapplicable to the agrarian social structure in Tigray" (p. 20). He supports this assertion by his patently erroneous assessment that "wealth was normally defined in terms of possession of capital, largely in the form of oxen and other animals, and not land" (p. 20). He then posits that regime stimulus for revolt and nationalism deserve greater attention as mobilizing factors in enlisting peasant support for objectives beyond local/provincial concerns.

The first two chapters provide the theoretical and historical background. The third chapter brings to life the conditions in rural and urban Tigray in the 1970s that led to armed resistance. The TPLF's leadership, "drawn disproportionately from the educated sons of the rich peasantry and the lower-middle local nobility," used real and perceived grievances of Amhara domination to unite the different ideological camps of monarchists, republicans, religious officials, and Marxist-Lennists to rebel against the Addis Ababa regime (p. 85). Chapter 4 is a political saga of the TPLF during 1975–78, replete with accounts of bank robberies in distant borderlands, bandits fighting for a nobility under siege, gruesome tales of betrayals and executions, and alliance-building with other armed political groups, at the end of

which the TPLF emerges as a winner. In the next chapter the author deals with the making and breaking of the TPLF and Eritrean People's Liberation Front alliance, the politics of famine, internal power struggles, and the emergence of a clandestine vanguard party known as the Marxist-Leninist League of Tigray (MLLT).

One is sympathetic to Young's difficulty in overcoming official "reticence" regarding dissidence. Tracing and documenting the shadowy existence of the MLLT and identifying town and regional grievances of discrimination are noteworthy achievements. It is to his credit that as an external analyst and a relative newcomer to the study of Ethiopian politics, Young was able to discern the underlying contradictions present in the discourse and praxis of the organization. Unfortunately, his persistent efforts to center the peasantry in this study of the TPLF diminish the theoretical illuminations that otherwise would logically emerge from this fascinating study of ethionationalism. Nevertheless, the author succeeds in documenting this crucial period during which the ideological fault lines of post-1991 Ethiopia first appeared.

In chapter 7, Young analyzes TPLF policies of recruitment and retention, which used cultural symbols and political education that embraced both traditional and radical elements of the society. The TPLF represented itself as a defender of the faith to adherents of both Christianity and Islam. Radical reforms, such as the much touted liberation of women, clashed with both religious and patriarchal institutions and resulted in the postponement of concrete reforms (pp. 178–81). The discordance between image and reality documented by the author is in stark contrast to the pervasive

fiction of gender equality and "open dissent" (p. 140). Young's account of the TPLF strategy of mobilization indicates a number of compromises and postponed promises. Key among these is the leadership's responsibility to kith and kin in the region, which, in the eyes of the peasantry, supercedes any responsibilities the TPLF leadership may bear to their multiethnic constituencies. The author questions the lack of transparency of the TPLF-EPRDF regime and its contradictory discourse(s), but he too readily succumbs to facile arguments that "Abyssinian culture typically endorses secretive, evasive, and distrustful behaviour, and sees openness as akin to innocence and simplicity" (p. 211).

Young has traveled fruitfully through very difficult terrain, but he is outmatched by a leadership well versed in the art of dissimulation. Overall, he must be commended for the completion of a pioneering work and for his effort to present a rigorous study of one of Africa's most ancient and closed societies. This work raises important questions about the prospects of Ethiopia's "cultural aristocrats," whose harshness is camouflaged by the Maoist-Marxist-Leninist rhetoric and whose ethnonationalist discourse has lost its moorings. The existence of a political culture of secrecy and the absence of requisite ethnographic skills in the extraction of verifiable knowledge present any outsider, however diligent, with lofty barriers. Notwithstanding all these difficulties, this book is a valuable reference. It is a fascinating study that points to the need for urgent attention to the problems of cultural translation as comparativists engage in the pursuit of knowledge about nationalism, revolutions, and the rapidly disappearing peasantry class.

International Relations

Institutional Designs for a Complex World: Bargaining, Linkages, and Nesting. Edited by Vinod K. Aggarwal. Ithaca, NY: Cornell University Press, 1998. 224p. \$65.00.

Oran R. Young, Dartmouth College

This collection of essays is a welcome addition to the small but growing literature on institutional interplay, that is, interactions between or among distinct institutions operating in international society. The analytic focus is on linkages that may be described as horizontal, in the sense that the interactions considered occur at the same social scale (i.e., within international society), and as political, in the sense that the cases examined involve conscious efforts to work out appropriate relationships among distinct institutions. The primary substantive focus is on arrangements dealing with economic activities, although one of the case studies extends the argument to the realm of security affairs. The book does not cover the full range of issues associated with the idea of institutional interplay, but the portion it does cover is obviously important and properly subject to careful scrutiny as a subset of the broader domain of institutional interplay.

The book directs attention to situations in which crises or mounting pressures call into question existing institutional arrangements. In such situations, institutional responses are likely to take the form of modifying existing arrangements to meet the new conditions. Those responsible for handling such institutional adjustments must reconcile the new institutional forms with the previous arrangements. The central argument is that reconciliation can take one of two forms: nesting, in the sense that the new arrangements are linked in

some hierarchical way with previous arrangements, or a division of labor, in which distinct institutions handle separate tasks. The choice of strategy and the consequences arising from such choices are determined by what Vinod Aggarwal, in his theoretical chapter, calls institutional bargaining games. Understanding institutional interplay, then, comes down to an effort to grasp the nature of institutional bargaining and the forces that determine outcomes arising from institutional bargaining games in specific situations.

The detailed case studies presented in the various substantive chapters offer a selection of empirical examples that is less than ideal for an analysis of institutional bargaining games. In a study of the 1992-93 crisis afflicting the European Monetary System (EMS) in the aftermath of German reunification, Steven Weber argues that the existing arrangement actually survived with relatively modest alterations due in considerable measure to the fact that the EMS is nested into the larger framework of the European Union (EU). Focusing on the Bosnian crisis, Beverly Crawford analyzes efforts to work out an appropriate division of labor among organizations—the WEU (Western European Union), OSCE (Organization for Security and Co-operation in Europe), NATO (North Atlantic Treaty Organization), and the UN (United Nations)—interested in keeping or making peace in southeastern Europe. She concludes that "a vague, institutional division of labor" (p. 112) was emerging by the time of the 1995 Dayton Agreement, although it is hard to see how this helped Bosnia or provided a basis for handling subsequent crises in the region, such as the 1999 confrontation over Kosovo. Cedric Dupont considers the effort to nest the EU and EFTA (European Free Trade Association) into a broader arrangement known as the European Economic Area (EEA), and Benjamin Cohen looks at the effort to nest the Financial Support Fund (FSF) into the Organization for Economic Cooperation and Development (OECD) in the wake of the 1973–74 oil shock. On the evidence presented in the case studies, both initiatives ended in failure.

Even so, the case studies provide a rich vein of evidence relating to institutional bargaining in situations in which it is important to reconcile new or substantially revised arrangements with existing institutions. Some important insights surface from a reading of the detailed accounts. It is essential to consider the various stages of the bargaining process. An arrangement like the FSF, which passes the negotiation stage with flying colors, may founder at the stage of ratification and implementation. Initiatives launched in one arena may be overtaken by events occurring in other settings. The decision of the key members of EFTA to apply for membership in the EU effectively destroyed the rationale underlying the EEA. Links to broader institutions may help a specific arrangement meet severe challenges without any basic restructuring. It probably would have been a mistake for key players to initiate any radical changes in the EMS as a response to the exchange rate crisis of 1992-93, even in the wake of such drastic steps as the withdrawal of the British pound and the Italian lira from the system.

This collection is not beyond criticism on methodological grounds. The "hypotheses" dealing with various facets of institutional bargaining games (e.g., the choice between the strategies of nesting and the pursuit of a division of labor, the selection of a multilateral or a bilateral approach) are not stated with sufficient specificity to make them easy to explore in the cases (pp. 23–7). As is often the case in works of this sort, the selection of cases for in-depth study seems to be based on ad hoc considerations. It is hard to compare and contrast the conclusions to be drawn from the four individual case studies regarding the "hypotheses" about institutional bargaining. There is no way to judge the extent to which the findings of this project are generalizable to other issue areas.

Nonetheless, these shortcomings should not be allowed to obscure the real contributions of this collection. Institutional interplay is an increasingly important but poorly understood phenomenon at the international level. Institutional bargaining games clearly loom large in any consideration of political linkages in international society. In thinking about the relative importance of power, interests, and knowledge as determinants of institutional bargaining, it is surely correct to conclude that "one size does not fit all with respect to explaining the process of institutional change" (p. 206).

From Motherhood to Citizenship: Women's Rights and International Organizations. By Nitza Berkovitch. Baltimore, MD: Johns Hopkins University Press, 1999. 224p. \$34.95.

Elisabeth J. Friedman, Barnard College

One of the more interesting puzzles in political science is why nations choose to undertake similar reforms—whether in legislation or institutional design—at roughly the same time. This becomes particularly intriguing when the reforms address historically controversial issues, such as the equal rights of women. Nitza Berkovitch takes on the challenge of explaining why it is that "in such different societies... women were granted the same kinds of rights, at approximately the same period of time" (p. 5). In a study that spans 1875 to 1985, she answers that the global cultural and political system

of international institutions and associations, particularly its discourses on women's rights, has been primarily responsible. She presents new information that refutes nation-centric explanations of systemic political change and adds a significant work to the literature on international women's rights. This book would be useful for analysts of international organizations, national legislative reform, and women's movements.

Berkovitch's argument is based in large part in the "world polity" literature from sociological institutional theory. This literature finds that concurrent state action on particular issues cannot be explained by examining the characteristics and processes of individual nations. Instead, it conceives of nations as subparts of a "cultural-political" global polity, a Westernized, rationalized, "highly institutionalized but stateless structure" (p. 9). Particularly in the post–World War II era, its central players have become international actors who produce global discourses that influence the models of organization used by individual nations.

Because of her focus on the effect of global discourses on issues of women's rights, Berkovitch also draws on feminist theories of citizenship. Countering the arguments of other institutionalists, she holds that the extension of citizenship to women cannot be seen as part of a general extension of the right to participate in public institutions to marginalized groups. Instead, women's incorporation has been fundamentally marked by their historic association with the private sphere of domestic responsibilities. Thus, women's citizenship has often been restricted in ways that reflect societal assumptions about their duties as homemakers, specifically as mothers. As these assumptions have broadened, however, equality, not just motherhood, has become a legitimate justification for women's rights.

Following chapter 1, which is an introduction to the theory and cases used, the book is organized chronologically to trace the effect of a consolidating world polity on women's rights. It focuses particularly on workplace rights and how these have changed with respect to changing discourses on womanhood. Chapter 2 analyzes international campaigns carried out by "transnational social reformers" from the mid-1800s to World War I: promoting suffrage, preventing prostitution and trafficking in women, and institutionalizing protective labor legislation. Relying on the more general reform vision of this historical period, the campaigns all conceived of women as needing protection or offering a distinctively "female" perspective on social change.

Chapter 3 examines the interwar period and covers developments in the issues of trafficking and labor legislation as overseen by two new important actors in the world polity: the League of Nations and the International Labour Organization (ILO). Although they promoted regulation of these issues at both international and national levels, their concern not to meddle with the internal business of states—including their control over gender relations—resulted in the continued emphasis on the protection of mothers rather than the empowerment of individual female citizens. At the same time, the international women's peace movement is shown to have promoted a powerful claim to a universal maternalism that demanded protection for all sons.

Chapter 4 addresses the more "consolidated" period of the world polity following World War II, with the simultaneous expansion of the nation-state system and extension of supranational institutions and organizations heavily influenced by the international human rights regime. In particular, the newly established UN Commission on the Status of Women and the ILO had a salutary effect on the spread of women's workplace rights across the globe. In a significant shift, these

were granted nationally not as protection for mothers but as rights of equal opportunity for female citizens.

By the time of the UN Decade on Women (1975–85), an increasingly coherent world polity linked women's rights with economic development efforts. An institutional effect emerged from the global campaign to incorporate women into national development: Some type of official national women's agency is now found in almost all countries.

Using a combination of archival, secondary, and statistical analysis, Berkovitch demonstrates that the "contagion" of women's rights across the world, particularly since World War II, is not some mysterious effect of diffusion but the result of the integration of nations into a wider cultural system. She also specifies the gendering of this system without ignoring the historical demands of women's rights activists for both protective and equal rights.

As can most global explanations, this one can be faulted for its generality. It largely erases the differences among countries, all of which are seen to be advancing, albeit at different paces, into the "Western" bureaucratized culture of the world polity. Case studies of national women's agencies show how adoption of world models is neither a smooth nor a wholly productive endeavor in countries where institutionalization, and women's rights, are contested matters (e.g., Anne Marie Goetz, The Politics of Integrating Gender to State Development Processes, 1995).

Moreover, the concept of the "world polity" itself is a bit slippery. At times associations, institutions, discourses, or policies emerge as the primary components. Their relative importance does depend on the historical context, but at times the agency of institutions and the discourses themselves seem overemphasized. As a central example, it is puzzling that international organizations and discourses are given more explanatory weight in the promotion of women's rights precisely when "second wave" women's movements are exploding worldwide (see chap. 5). Where are the contributions made by "women in development/gender and development" activists to both discourse and action on development from the early 1970s onward? In addition, the material basis for policy change is secondary in the overall argument. Given that workplace rights are the focus, it would be interesting to have a more systematic assessment of the timing of both industrialization and the spread of labor market theories based on efficiency to judge their effect.

Moral Spaces: Rethinking Ethics and World Politics. Edited by David Campbell and Michael J. Shapiro. Minneapolis: University of Minnesota Press, 1999. 268p. \$19.95.

International Society: Diverse Ethical Perspectives. Edited by David R. Mapel and Terry Nardin. Princeton, NJ: Princeton University Press, 1998. 263p. \$35.00.

Yosef Lapid, New Mexico State University

In a seminal article published in 1992, Steve Smith astutely observed that the bizarre "forty years' detour" that had taken the scholarly field known as international relations (IR) away from moral questions and ethical dilemmas was coming to an end. At the heart of this "normative turn," wrote Smith, lies a renewed recognition that the IR "subject is unavoidably normative" (Steve Smith, "The Forty Years' Detour: The Resurgence of Normative Theory in International Relations," Millennium 21 [1992]: 490–514). The two excellent but strikingly different edited volumes under consideration confirm that a normative "turn" of sorts continues to mature in IR. They also suggest that the character of the scholarly work resulting from this trend will become increasingly more

contested as more parties lay claim to shaping IR's revitalized normative agenda. Contextualized in this manner, a joint consideration of these two books becomes a richly rewarding undertaking. At stake is the ability of a rapidly expanding group of scholars who profess a shared interest in both IR-related ethical questions and dilemmas and in an open and dialogical scholarly style to engage productively in scholarly practice.

Produced under the auspices of the Ethikon Institute, the format of the Mapel and Nardin volume is carefully shaped to serve the worthwhile mission of "bringing scholars representing a diversity of moral viewpoints into structured dialogue with one another." This mission is elegantly restated at the end of a brief, but effective, introduction by the two editors. It also lists the three related questions addressed by all contributors: What is the proper constitution of international society? What is the basis for the authority of laws and institutions in this society? And to what extent do these laws and institutions adequately reflect a concern for justice in a world of diverse cultural communities and deep economic disparities? The thematic unity of the book is further enhanced in the concluding chapter, written by David Mapel, which offers some suggestive interpretations regarding the main issues that emerge from this volume.

Perhaps the most attractive feature of the Mapel and Nardin volume is the editorial decision to opt for a nontraditional approach that allows spokespersons for alternative viewpoints in five ethical perspectives—legal positivism (Terry Nardin and Frederik G. Wheelan), natural law (Robert P. George and Richard B. Friedman), Kantianism (Pierre Laberge and Fernando R. Teson), contractarianism (John Charvet and Chris Brown), and cosmopolitanism (Brian Barry and David Miller)-to engage one another directly. The decision to include three religious perspectives-Jewish (David Novak), Christian (Max L. Stackhouse), and Islamic (Sohail H. Hashmi)—s also commendable, but the conspicuous omission of such major religions as Buddhism, Confucianism, and Hinduism cannot be easily explained. As a rule, the thirteen chapters are solidly researched and effectively written, although some of the philosophical chapters, in particular, are densely argued and may be less accessible to entry-level readers.

The volume edited by David Campbell and Michael J. Shapiro falls in the general area of ethics and world politics but involves a drastic change of vocabulary and intellectual landscape. This is hardly surprising, as Moral Spaces deliberately sets its sight at redefining the entire budding subfield of normative IR theory. One page into the bold and forcefully argued Introduction, Campbell and Shapiro submit that "the 'ethics and international affairs' literature is based on some questionable fundamentals" (p. viii). Noteworthy in this context is the explicit identification of a previous volume by Nardin and Mapel (see note 6, p. xix) as an exemplar of the kind of work that is being challenged or rejected. The main charge leveled against such "orthodox frames of reference" largely echoes the postmodernist critique of all modernist attempts to legislate morality through universally applicable codes of conduct. "Rather than engaging in the traditional search for a grounding for supranational principles," write Campbell and Shapiro, "the various contributions investigate the contingencies involved in specific historically situated

encounters" (p. ix).

In a spirited effort to replace "an epistemologically oriented ethics of discovery" with an "ethics of encounter without a commitment to resolution or closure" (p. xvii), in Moral Spaces editors and contributors alike draw heavily, but not exclusively or uncritically, on the work of Derrida, Foucault, and Levinas, in particular. The effort to establish a

principled distinction between a conventional "theory of ethics" and the (Levinasian) "ethical relation" is intriguing, as is the editorial emphasis on "the radical entanglement between moral discourses and spatial imaginaries" (p. ix). Resulting from all this is the demarcation of a promising research agenda that seeks a sustained (re)consideration of the relationship among space, subjectivity, and ethics in international relations and world politics.

All the contributions in Moral Spaces, a provocative and well-conceived volume, converge on this theme. This is remarkable in view of the fact that, with the exception of an original essay by Michael Dillon, all other eight chapters were previously published. In different ways, each individual chapter indeed stands alone as a significant scholarly contribution. Diverse issues are covered, including the link between community and responsibility (Daniel Werner); the figures of the "stranger," the "refugee," and the "emigre" (Michael Dillon, Bonnie Honig); suffering and justice (William Connolly); critical humanism (Kate Manzo); state-sanctioned violence (Patricia Molloy); and the ethics of global market research (Richard Maxwell). Combined into one volume, these chapters make a persuasive case for a far more radical expansion of the range of alternative perspectives that deserve serious consideration in shaping the agenda of the current normative turn in IR.

As already noted, I find considerable merits in both these volumes. In a basic sense, both address ways to overcome the same serious shortcoming in IR, namely, the absence of a well-conceived and properly developed normative element. And both offer the reader sophisticated and up-to-date contributions on current thinking on the nature of international ethics and/or ethical relations. In at least one fundamental sense, however, these volumes also give occasion to some alarming or disturbing thoughts. One cannot possibly walk away from them with any optimism about the prospects for dialogue and cross-fertilization between the approaches that they present and advocate.

Yet, profound differences in respective points of departure and underlying premises notwithstanding, one cannot, or perhaps should not, preclude the possibility of productive mutual engagement between them. This is particularly the case in view, for instance, of Mapel and Nardin's strong emphasis on the need to promote conversation between "dissimilar, even irreconcilable voices" (p. 13). This emphasis does not translate, however, to even one accidental reference to alternative ethics and international affairs projects or literatures similar to those favored by Campbell and Shapiro. And the latter, despite their gestural effort to reassure the "mainstream" that they conceive of their project as an alternative but "not the only alternative, and not the alternative" (p. ix, emphasis in original), repeatedly, and perhaps unnecessarily, engage in the kind of oppositional rhetoric that can easily turn scholarly discussions into bitterly polarized battlegrounds. Perhaps we see here the making of yet another major missed intellectual opportunity by those who hold radically different ontological, epistemological, and axiological views, but who share an interest in the same scholarly project (i.e., advancing the cause of a productive "normative turn" in IRs) to find some common ground for sustained dialogue and discussion. It is a deeply contested field, and there is perhaps no reason to believe, or to hope, that would-be participants in the shaping of IR's reenergized normative agenda would be able somehow to escape this contestation. Still, one cannot easily dismiss the thought that wider intellectual, disciplinary, and practical interests would be better served if such were the case.

Alignment Despite Antagonism: The United States-Korea-Japan Security Triangle. By Victor D. Cha. Stanford, CA: Stanford University Press, 1999. 373p. \$59.95 cloth, \$19.95 paper.

Mel Gurtov, Portland State University

What accounts for the "puzzling" uncooperativeness that generally characterizes relations between South Korea and Japan? Realist theory and balance-of-power politics cannot account for the constant friction in a relationship that, on strategic grounds, ought to be consistently cooperative. Victor Cha explores the dilemma, in both theoretical and policy terms, by using as his basic framework the notion of "quasialliance," "in which two states (Japan and South Korea) remain unallied but share a third party (the United States) as a common ally" (p. 3). Rejecting as incomplete explanations of Japan-Korea conflict that are based on historical animosity, economic structural differences, and domestic political influences, Cha seeks-for the most part, successfully-to extend realist analysis in order to arrive at a richer understanding not only of Japan-Korea relations but also of the still dangerous northeast Asia security situation.

An important contribution of Cha's well-researched book, which covers 1965 (when relations between Japan and South Korea were normalized) to 1998, is to qualify two different and widely accepted notions of what lies at the heart of Japanese-South Korean tensions: either the ugliness of their past relations or a common threat (North Korea) and need of a U.S. deterrent is a sufficient explanation. Beginning with an elegant case study of the 1965 normalization, Cha closely examines various phases in the volatile relationship. Of importance to both past and future policy in northeast Asia is his finding that the less Korean and Japanese leaders are convinced of the U.S. commitment, the more they are inclined to autonomous policymaking and cooperation with one another. Insecurity, in a word, promotes friendliness.

Yet, one wonders if this quite logical conclusion is sufficient. Even in 1965, but more so as we move into the 1980s and 1990s, Korean and Japanese choices were framed by factors other than U.S. security policies. Indeed, Cha does not neglect to mention them: pressures at home from political opponents, for example, and concerns about trade and technology imbalances that have long favored Japan, not to mention the constant intrusion of historical memory. Measuring "enmity," cooperative versus competitive behavior, and especially perceptions of the U.S. commitment (which often has been ambiguously communicated) is, it must be conceded, exceedingly difficult. In the end, it is hard to say that the case has been proven on behalf of the quasi-alliance theory. Rather, what Cha has accomplished is to put in the reader's mind a new set of variables to help explain Korean-Japanese tensions.

As Cha acknowledges (pp. 198, 230), the quasi-alliance theory may have less applicability today than in the Cold War era. In the new circumstances—diminished external threats; increased multilateral diplomacy; emphasis on the economic, technological, and financial components of security; and increasing pluralization of domestic political life-international relations in northeast Asia since the late 1980s are far more complex than they were during the Cold War. It is likely that Japanese and Korean security dependence on the United States will remain for some time, but there are many signs of change that make the realist argument, even with Cha's refinements, less compelling. Among them are South Korea's substantial trade and investment ties with China; the Four Party Talks (which might extend to six outside parties) on a final settlement of the Korean conflict; the multilateral Korean Peninsula Energy Development Organization

(KEDO), formed to alleviate North Korea's energy problems in exchange for a freeze on Pyongyang's nuclear weapons program; bilateral military consultations among China, South Korea, and Japan as well as those countries' involvement in the ASEAN Regional Forum to discuss security issues; and prospects for regular trilateral summit meetings of Korean, Chinese, and Japanese leaders.

Although Tokyo and Seoul are concerned as always about being abandoned by the United States, cooperation between them increased in the 1990s, bilaterally and multilaterally, at a time when the U.S. commitment to Asian security remains firm. For better or worse, Washington has not abandoned its Cold War priority of maintaining a balance of power and emphasizing its bilateral alliances in Asia. In such circumstances, relations between Japan and South Korea should be rocky, according to the quasi-alliance theory. In fact, although some long-standing issues remain, there are several indications of real improvement, such as joint financing of KEDO, Korea's removal of its ban on many Japanese cultural imports, coordination of policy on North Korea's missile tests, and President Kim Dae Jung's visit to Tokyo in fall 1999 in an effort to put historical bitterness behind the two countries. The explanation for these recent changes lies not only in Realpolitik—the shared concern of South Korea and Japan about North Korea's intentions—but also in South Korean democratization, U.S. prodding, and defense policy initiatives by both Japan and South Korea. A quasi-alliance and a strategic triangle remain, but they are not the only games in town.

Finance Capitalism Unveiled: Banks and the German Political Economy. By Richard Deeg. Ann Arbor: University of Michigan Press, 1999. 312p. \$49.50.

J. Samuel Barkin, University of Florida

Is globalization undermining the traditional Continental European model of finance capitalism and causing it to converge with the Anglo-American model? Richard Deeg argues that it is not. He begins with two archetypes, the coordinated market economy and the liberal market economy, representing the Continental and Anglo-American models, respectively. He concludes that there is some convergence, but the coordinated market economy model as represented by the German system of corporate finance is retaining its distinctiveness.

The book is divided into three sections. The first presents a theoretical overview of the two models of capitalism that Deeg uses as ideal types, coordinated and liberal market economies, and the arguments as to why globalization should be causing a convergence of the two. The second section examines the history and evolution of banking in Germany from the nineteenth century through the present. It explains the tripartite structure of German banking—the parallel development of the large private commercial banks, the public savings banks, and the private cooperative banks—and the principle of competition among rather than within the groups. It also specifically looks at the process of "Anglo-Saxonization," a combination of marketization and securitization, of the German financial system. The third section provides three regional case studies: North Rhine-Westphalia, Baden-Wurttemberg, and the East. The first two of these case chapters look at the evolution of finance capitalism within the Land in question, and the third looks at developments in what was East Germany since unification. These cases suggest that the German financial model is not monolithic, that there are important regional differences.

Deeg is trying to do two things: provide a detailed devel-

opmental history of the German system of corporate finance and make a case in the larger debate about globalization and the convergence of national financial systems. Both efforts display strengths and weaknesses. As a history of the development of the relationship between financial institutions and industrial corporations in Germany, the book for the most part succeeds. Drawing on primary sources and on an extensive reading of the secondary literature in English and German, Deeg paints a portrait of German finance that is both broad and detailed. As a history of the modern German financial system, this book is well worth reading. The two empirical sections, on the development of the tripartite system and on the regional cases, are not as well integrated as they might be, however. Yet, the two sections individually highlight phenomena (intersectoral rather than interfirm competition, and the degree of difference in financial systems in different parts of Germany) that do not get as much press as perhaps they should.

As an entry in the debate on the effects of financial globalization this book makes a useful but flawed contribution. It poses interesting and important questions and grounds answers in empirical research, a process often forgotten in the occasionally ideological and rhetorical debates on the subject. But the method through which Deeg matches questions and answers is problematic in two ways. The first concerns the model of the German system that the author uses as a rhetorical starting point. The coordinated market economy model is defined as one in which banks hold large stakes in industrial corporations and are thus able to play major roles in corporate management and strategy. As a result, this model of capitalism encourages longer time horizons in industrial strategy and management. Deeg then argues at some length that this model is inaccurate. But in many ways the model is a red herring. The idea that industrial restructuring in Germany has been less than ideally managed, or that government plays a significant role in the German corporatist system of industrial governance, will not come as surprises to anyone familiar with the German economy. But the efforts to argue against the idealized model sometimes seem to contradict the argument about globalization; many of the ways in which German finance is diverging from a pure coordinated market economy sound very much like convergence with the liberal market economy.

The second methodological problem is that the dependent variable of the argument is not always clear. It seems to oscillate between the banking system narrowly defined and the financial system more broadly defined, on the assumption that what is true for one is true for the other. But this assumption does not necessarily hold. For example, it may turn out that banks in liberal market systems, particularly in the United States with the demise of Glass-Steagall, will come to resemble the German model of Allfinanz. But it could be the case at the same time that German finance is more generally becoming less bank centered and more equity centered. In other words, some features of Anglo-American finance may be converging toward the German model, while other features of the German model trend toward the Anglo-American norm. The lack of clarity concerning the dependent variable undermines some of the potential for nuance in the argument.

Finally, some trends are barely mentioned that might have been discussed at greater length. Two examples are the role of European Union competition authorities and the generational change occurring in the Mitelstand. The former may well end up separating Land governments from their savings banks, making these institutions more like private corporate banks. What might this do for the tripartite structure upon

which the German financial system is based? The latter may, as Deeg points out, result in a trend among Mitelstand firms toward public ownership and thus toward equity rather than bank finance. This would make German finance look much more like the Anglo-American model than is currently the case.

In short, this book is a valuable resource for students of German finance, of German industrial development, and of processes of financial globalization. It does not in the end provide convincing support for its thesis that the German financial system is maintaining its coordinative character in the face of the pressures of globalization, but the process of getting there is both useful and informative.

Civilian Control of the Military: The Changing Security Environment. By Michael C. Desch. Baltimore, MD: Johns Hopkins University Press, 1999. 184p. \$69.00 cloth, \$22.95 paper.

Peter Feaver, Duke University

This book is a hallmark of the recent renaissance in civilmilitary relations theory, and it shares the characteristics common to the revival: an explicit emphasis on theory building/testing and an effort to link the study of civil-military relations to other debates within political science. Desch's book is the most ambitious of these new treatments and already has proven influential in shaping the debate within the academic and the policymaking communities.

Desch's first contribution is to operationalize his dependent variable so as to capture variation in civil-military relations even in countries that have not experienced the traditional bogeyman of the field, a military coup. The primary dependent variable is civilian control, which Desch defines as whether civilian policy preferences prevail over military preferences when the two diverge. Military preferences can prevail even without a coup; witness what happened to President Clinton's effort to lift the ban on gays serving openly in the military. Such a definition is not without its limitations—military influence can be so subtle and pervasive that it does not even generate publicized policy disputes for the analyst to measure—but it has more analytical purchase than most alternatives.

To explain variation in civilian control, Desch develops a structural model based on the nature and intensity of the threats facing the state. External threat has been a key variable in most civil-military models, but Desch adds considerations of internal threat to generate a two-by-two table: high external and high internal threats; high external, low internal; low external, high internal; and low external, low internal. Following social conflict theory, Desch claims that the intensity of the threat determines cohesion: When threats are weak, military organizations will be weak and divided; when threats are great, military organizations will unify so as to counter the threat more efficiently. The direction of the threat determines the orientation of military organizations, outward (against the enemy) or inward, where it can pose a challenge to civilian rule. Thus, the worst relations are found with a low external threat and a high internal threat; the best relations are with a high external threat and a low internal threat.

Note that whereas both Huntington and Lasswell predicted that the Cold War would produce bad civil-military relations in the United States—because the high threat would necessitate large forces that would chafe against the constraints imposed by liberal society—Desch's model makes the opposite (and correct) prediction.

In two important threat configurations, Desch's model is, by the author's own admission, indeterminate. When both internal and external threats are high, the model cannot say whether there will be good civilian control, because the external threat has oriented the military outward, or bad civilian control, because the threats have unified the military and the presence of an internal threat is sufficient to distract the military inward. When both threats are low, the model cannot say whether there will be good civilian control, because the military will be divided (and thus, presumably, easy to control), or bad civilian control, because without any threats the military's orientation will be uncertain (or because the divided institutions slip into contentious factionalism). Which outcome prevails depends, according to Desch, on ideational factors, such as organizational culture and clashing world-views, a story that transpires more or less off Desch's structural stage.

Desch's model is attractively parsimonious and generalizable, giving an account for shifting patterns of civil-military relations in great as well as small powers and under a variety of different international conditions. Perhaps because the model is so parsimonious, however, one wonders whether the causal mechanisms are undertheorized. For instance, it is not clear why an intensified internal threat does not unify the government as a whole, thus strengthening all governmental institutions, including the civilian ones with which military institutions might vie for political power.

Desch does suggest six causal mechanisms (in his model they are intervening variables), but in doing so he muddies somewhat his otherwise clear dependent variable of obedience: (1) the degree of experience the leaders are likely to have; (2) how unified the civilians are likely to be; (3) the kind of control mechanism civilians are likely to adopt; (4) how unified the military is likely to be; (5) the orientation of the military; and (6) how divergent the ideas of civilians and the military are likely to be. Although Desch does not treat them in this way, these intervening variables are in fact the direct predictions of his model and thus collectively represent an alternative dependent variable that I would call a "conflict" variable. Conflict is probably related in some degree to obedience; we would expect that higher degrees of conflict will be associated with lower degrees of obedience. The two variables are, however, logically separate: A country can experience lots of conflict and friction even while, and perhaps precisely because, civilian preferences are consistently prevailing over military preferences.

Desch tests his model with case studies of twentieth-century (and primarily post-World War II) civil-military relations in eight countries (Argentina, Brazil, Chile, France, Germany, Japan, Soviet Union/Russia, and the United States). Since threat conditions in these countries fluctuated during the time studied, he has ample variance on his explanatory and dependent variables. Historians might quibble with the reliance on an extensive secondary literature, but this is precisely the kind of cumulation of knowledge that normal science supposedly affords, and it allows Desch to be far more comprehensive and sweeping than a more archive-intensive study might permit.

Desch sees more support for his model in the case studies than do I, but I find his empirical judgments compelling even about ambiguous facts. Indeed, his coding on U.S. civilmilitary relations is likely to be one of the most cited points in the book. In a very important appendix, Desch documents whose preferences prevailed in roughly seventy-five "major civil-military conflicts" since 1938. He finds that civilian preferences clearly prevailed in all but four conflicts during the Cold War, but military preferences prevailed in seven of the twelve cases in the post—Cold War period.

The book is important because it makes a bold argument

based on a clearly advanced theory and tests it against an extraordinary range of cases. Desch's exceptional empirical scope bears emphasis, since it distinguishes his work from other theoretically ambitious treatments of civil-military relations (including my own), which tend to look at only a few or even just one country. No other study has paired such a generalizable and parsimonious theory with such a diverse range of cases. On reach alone it is a landmark study.

As might be expected, to pursue such an ambitious goal Desch had to accept quite a lean model, and one might still want a theory that would pay greater attention to the micro-foundations of civil-military relations. But on its own terms the argument is provocative and compelling and highly recommended.

Russia Confronts Chechnya: Roots of a Separatist Conflict. By John D. Dunlop. Cambridge: Cambridge University Press. 1998. 234p. \$18.95 paper.

William Zimmerman, University of Michigan

At century's end, the problem of war between clearly independent states seems to have been largely resolved. The realists' key distinction between politics under conditions of anarchy and other politics turns out to be a wise one, if and only if that distinction is not conflated with the distinguishing politics among states and politics within states. Anarchy, self-help, and the persistent danger of large-scale violence largely exist within states, or former states, especially within those states wherein elites are staking out claims for the independence of some territorially specific parts of that state. The Yugoslav wars in the 1990s have been an obvious example in the Balkans. There have been multiple instances in the Caucasus as well, where it is likely more blood has been shed in the past decade, although without coverage by CNN, than in the Balkans. There have been wars there within the Republic of Georgia and between Armenia and Azerbaijan over Nagorno-Karabakh. There, too, occurred the Russian-Chechen conflict in 1994-96, which resumed in 1999 when forces from Chechnya, probably not controlled by the national leadership of the republic, attacked neighboring

Especially for those who do not read Russian, John B. Dunlop's Russia Confronts Chechnya provides a valuable prehistory to the 1994–96 war. It is largely sympathetic to the Chechen cause. As is more common for historians than political scientists, the analysis is largely buried in the description

But the key points do emerge. (1) Like the Serbs and the Kosovars (and unlike the Serbs and the Croats), the Russians and the Chechens have been at each other's throats for some while now; the first conflict per se dates from 1722 and Peter the Great's efforts to expand into the Caucasus. (2) The cause of these conflicts was not the radical Islamic faith of the Chechens. Rather, the causal arrow largely went the other way. The Chechens, Dunlop argues, became "observant Muslims" as a result of the "perceived massive aggression on the part of the 'infidel' Russians" (p. 10), which transformed them from "superficially" Islamic peoples into "observant Muslims." (3) Ethnic cleansing is scarcely a new phenomenon. Much of the story of Chechnya in the past 150 years is one of forced migration followed by the return to the Caucasus of many survivors of the migration. The most recent forced migration took place in 1944 under Stalin. (4) Ethnic awareness for the Chechens and others in the northern Caucasus—as opposed, for instance, to clan identity was largely a consequence of Soviet efforts to minimize a "'mountaineer' identity" among all the peoples of the Caucasus. (5) There has not been much learning in Moscow about how to handle Chechnya. The temptation to resort to a policy composed of some blend of deceit, repression, and deportation has been difficult to resist, even though such policies, while sometimes successful in the short run, have generally been counterproductive over the longer haul.

These observations and the historical narrative in which they are imbedded are intended by Dunlop to serve as the backdrop to a successor volume that will treat the massive defeat of the Russian forces in Chechnya in the 1994-96 war. That war began in December 1994, only a few months after President Boris Yeltsin stated: "If we used force in Chechnya, it would . . . lead to such turmoil, so much bloodshed, that no one would forgive us afterward" (p. 164), and it ended when General Alexander Lebed negotiated an agreement with the Chechens in summer 1996 that virtually recognized the de facto independence of Chechnya. Sad to relate, there will probably be need for future volumes as well, beginning with a third to cover the latest round that began in 1999. In that round the Chechens, by virtue of their actions since the 1994-96 war, had far less by way of the moral advantage so central to Dunlop's account of the prehistory of that war, and the Russians demonstrated they had altered their tactics in response to the lessons of the humiliating 1994-96 defeat (and NATO practices in Kosovo) but little else.

The Third World Beyond the Cold War. Edited by Louise Fawcett and Yezid Sayigh. New York: Oxford University Press, 1999. 256p. \$78.00.

Ashok Kapur, University of Waterloo, Ontario

The Cold War and the Third World are two overly written, overly studied, and undertheorized topics in the social sciences literature. This book is another attempt to theorize, and readers need to grapple with many meaty questions. Was the Cold War a turning or a punctuation point in history compared to the two world wars? What is the scholarly record in explaining and predicting the end of the Cold War and its effect on the Third World? What is the effect of state behavior in the post-Cold War Third World? What is meant by the Third World, and what has changed in it since the end of the Cold War? Was the Cold War an agent or a source of change in the Third World? Can change in the Third World be understood best by way of a top-down or a bottom-up approach? Is there a Third World beyond the Cold War? Part I of this book offers thematic assessments, and Part II provides regional analyses.

The volume makes several points, but there is no consensus among the authors. (1) The ties among the developing countries have weakened; Third World solidarity was a temporary illusion. (2) The concept of Third World identity is fragile. (3) There is no accepted definition of the Third World or about the criteria to define it (economic condition, political culture, poverty, or relations to bipolar system), but there is a reluctance to drop the term. (4) Regionalization has emerged (pp. 6–10). (5) Chapters 7–8 speak about the marginalization of Africa and South Asia. (6) Recentralization of the state is occuring in the Middle East in the context of changing local and international conditions.

Recentralization is aided by the fact that "greater reliance on international capital for local development can actually increase the allocative power of the state and lead to 'recentralization.' "Two additional factors are at work. First, democratization is not on the agenda of the United States or major international financial institutions, which are more

concerned with governance (i.e., good public administration and managerial skills). Moreover, these global actors tend to overlook authoritarianism in the often intertwined causes of combating political Islam and of overcoming domestic resistance to economic liberalization. Second, as a result, the domestic and expatriate entrepreneurs who might be the potential engines of civil society are equally likely to fuse with the political elite in a property-owning class and collude in the construction of authoritarian liberalism (p. 228). This powerful insight is based on Middle East experiences, and it deserves to be tested in relation to other regional and state experiences.

The book also is about the failures of social scientists to explain and predict major international developments, such as the end of the Cold War and the consequences. This book argues that the end of the Cold War is not the end of the Third World, as realists and liberal theorists concluded (p. 96).

There is disappointment that hegemonic stability and the "unipolar moment" did not happen (p. 29). The authors disagree about the role of the state in international change. On the one hand, the realist emphasis on the state and the system of states is questioned (pp. 15, 17); on the other hand, it is asserted (chap. 9). What explains Third World outcomes? Consensus is lacking on this among the authors. Is it bipolar international structure? Is it the structure of the world economy? Is the regional power structure the appropriate level of analysis? Is the internal character of the unit important? Or should the emphasis be on the rise of "low security" issues, such as human rights and the environment in the context of state-society relations? The reader is teased to consider all the above, but the authors themselves are like the proverbial blind folks who offer different views of the elephant.

The volume offers definitions of Third World, but these are suggestive, not definitive. They include the usual inventory of contrasts: core-periphery; developed-developing; colonialısm-decolonization; central-marginal; dominant-subordinate; strong-weak states; and so on (pp. 18-21). Historically, the race question has been an issue in the anti-Western perception and revolt of the Third World. Surprisingly, this aspect and the role of nationalism in the Third World have been brushed aside. The effect of the Cold War on the Third World is considered, but again there is no consensus. The first view is that the Cold War and bipolarity increased or exacerbated the incidence of conflict in the Third World. The second view is that the superpower competition was constrained, and hence Third World's stability was enhanced. The third view is that the Cold War did not matter (pp. 22-3). It would be nice if the contributors had committed themselves to a position and argued it convincingly, rather than leave the reader to find the answers to the questions.

The book is flawed in the sense that definitive conclusions are not reached. Also, there are gaps in the framework. Bipolarity is treated as a given in the definition of the Cold War; yet, a close inspection of foreign policies and developmental policies of Third World countries would reveal that the context of decision making was multipolar, even in the heyday of the Cold War. For instance, the presence and influence of China in African and Asian politics begs analysis. Furthermore, from within the ranks of the Third World a number of regional powers—such as China, India, Vietnam, and Iran—have emerged. They have qualities of a "weak" society as well as a strong state; they are upwardly mobile in regional and international relations, and they have made strategic and diplomatic choices that made it impossible for

the international powers to decouple themselves from the rising regional power centers during the Cold War and following its end. The authors seem to be shy about discussing regional powers and regional security structures. Consequently, the work misses the opportunity to consider the changing structural context and the pattern of engagement between particular Third World states/societies and the international powers. If the Cold War symbolizes the presence and capacity of the stronger international powers, then the Third World symbolizes the presence of the "weaker" (not necessarily weak or insignificant) members of the system of states today. It would help to know about the strategies employed by the stronger and the weaker players vis-à-vis one another during and after the Cold War. Such an investigation could help capture the promise in the title and the subtitle of the book.

Despite its defects, the book is a bold venture. It should be required reading for graduate seminars dealing with international relations and the Third World. Contemporary theory obviously has failed to explain and predict major international events and to grasp the fundamental challenge of Third World nationalism, economic reform, and new military and nuclear capacity vis-à-vis Western policy interests and Western scholarly leadership. This study implicitly urges us to address the intellectual catastrophes of the social sciences, to revisit failed scholarship, and to find new research strategies to discover the points of engagement between specialists in the international relations and the Third World and between theoreticians and practitioners in the North and the South.

Even though the findings are not definitive and the volume lacks a unified research design, the editors have made a good contribution by opening up lines of inquiry that are likely to stimulate new researchers.

Must Global Politics Constrain Democracy? Great-Power Realism, Democratic Peace and Democratic Internationalism. By Alan Gilbert. Princeton, NJ: Princeton University Press, 1999. 316p. \$55.00 cloth, \$17.95 paper.

Ronnie D. Lipschutz, University of California, Santa Cruz

In the nearly 20 years since the publication of Michael Doyle's essay on the so-called democratic peace ("Kant, Liberal Legacies, and Foreign Affairs, Parts I and II," Phulosophy and Public Affairs 12 [Summer 1983]: 205–35; [Fall 1983]: 323–53), hundreds of journal articles, books, and dissertations have appeared that support or attack researchers' claims about as well as the theoretical premises and empirical bases of the concept. Alan Gilbert's contribution to this debate is unlikely to convince the warring factions of their errors, but it offers a devastating critique of American "democracy" that does serious damage to the methodological arguments and epistemological foundations of the two sides.

The fundamental questions—Do democracies ever go to war with one another? Are democracies inherently more peaceful?—appear, deductively, to be answerable mostly in the affirmative. But what has come to be described as "the closest thing we have to a law in international politics" (Jack S. Levy, "Domestic Politics and War," Journal of Interdisciplinary History 18 [Spring 1988]: 653–73) is better understood as a custom than a law in the physical sense. It takes only one failure to invalidate a physical law, whereas customs are violated all the time. More than that, as a social institution, democracies (or, rather, their members) are intersubjective, which means that they change over time and across space. For several reasons, this renders problematic any efforts to

assess the empirical basis of the claim for the democratic peace.

First, what is a democracy? Are the democracies of ancient Greece epistemologically the same as those of the early nineteenth century and the late twentieth? Is the practice of democratic forms, such as contested elections, equivalent to institutionalized democracy? For example, both Croatia and Serbia had elected governments during their war over Bosnia, but are they any more than oligarchies with parliamentary forms, as Gilbert puts it?

Second, what is a war? For the purposes of building databases, war has come to be defined as organized violence in which there are more than 1,000 deaths. What about conflicts with fewer casualties? Or civil wars? Or interventions by great powers in the affairs of weaker ones?

Finally, what constitutes a statistically significant data set? John Mearsheimer argues ("Back to the Future: Instability in Europe after the Cold War," International Security 15 [Summer 1990]: 50-1) that, because war is so rare and democracies so uncommon, it is not surprising that there are so few cases of democracies at war. In response, supporters of the democratic peace thesis have combed the historical record to find additional examples of regimes that fit the requirements. To no one's surprise, they have discovered additional cases and engendered further disputes.

Why does this debate matter? There are two primary reasons, both of which are addressed by Gilbert and both of which emerge from the fact that this conflict is one more engagement in the perennial liberal-realist war over international relations theory. First, liberals claim, normatively, that peace is good; consequently, the spread of democracy should reduce the incidence of war. That would be good for American national interests, an argument taken up by the Clinton administration, which made "democratization" one of the pillars of its foreign policy. Second, realists counter, normatively, that such hope is a thin reed on which to base one's national security, and it is a dangerous illusion akin to the idealism of the interwar period. Power remains a more reliable means of preventing war. Regime structure does not matter.

Gilbert launches a grassroots-based guerilla assault on the epistemologies of both positions, and he also raises serious challenges to both liberal and realist conventional wisdom. He argues that the United States is better understood as an "oligarchy with parliamentary forms," with the result that public opinion, normally thought to constrain warlike behavior through democratic practices, is largely ineffective. He points, in particular, to the American propensity to destabilize and overthrow regimes that are, paradoxically, too democratic for Washington (e.g., Guatemala in 1953, Iran in 1954, Chile in 1973). Such interventions, although violent, are not normally counted as "wars" because they are "domestic" and result in too few casualties. Such omissions matter because the United States represents one member of the many democratic dyads whose historical behavior is deemed to constitute the empirical validation of the democratic peace thesis.

These interventions, justified on the basis of great power rivalry, have a more pernicious consequence. They generate what Gilbert calls "antidemocratic feedback," domestic corruption of U.S. democracy, and broad cynicism about American intentions. But such behavior, argues Gilbert, also has paradoxical tendencies that support the democratic peace thesis. Although oligarchic leaderships proceed to war with minimal attention to domestic opposition—indeed, treat it as tantamount to treason, as seen in the marginalization of Hans Morgenthau by the Johnson administration during the Viet-

nam War—the failure to attend to a common good fosters a "democratic internationalism" among public movements opposed to the adventurism of the leadership. Gilbert calls this the "democratic feedback from international rivalry." He extends this general argument to condemn, as well, the oligarchic propensities of global capitalism to ignore both a common good and public pressure for democratization of international economic institutions and practices.

The controversy over the democratic peace thesis has been, and continues to be, driven not by "objective" scientific goals but largely normative ones. Intentionally or not, Doyle's original proposition served the Reagan administration's campaign on behalf of "democratic" regimes aligned with the United States against the Soviet Union. Today, the argument that democracy and markets go together supports the American campaign in favor of open markets and economic growth, and critics of marketization are seen as crypto-Marxists and losers in the great historical triumph of liberalism. Realists warn that belief in propositions such as the democratic peace can only end in sorrow, for to trust the good intentions of others—even democrats—is to tread the same path that led to Munich. Moreover, there is a large national security complex to whom "perpetual peace" might pose other kinds of dangers. The openly normative thrust of Gilbert's book is a breath of fresh air in a debate that appears to be increasingly concerned with statistical minutiae as opposed to ethical concerns and political behavior.

Ballots and Bullets: The Elusive Democratic Peace. By Joanne Gowa. Princeton, NJ: Princeton University Press, 1999. 136p. \$27.50.

John M. Owen IV, University of Virginia

Over the past several years Joanne Gowa has published a string of noteworthy attacks on the widely held proposition that liberal democracies seldom if ever fight wars against one another—the so-called democratic (or liberal) peace. Now Gowa combines, refines, and expands her attacks into a general offensive to which defenders of the democratic peace will have to respond. Its theoretical and empirical claims, if true, are devastating to the research program. Gowa argues that the analytical foundations of the democratic peace are wobbly at best; that the statistical evidence for it is inconclusive and even contrary; and that the structure of the international system better accounts for what appears to be democratic peace. She concludes that the United States should not promote democracy in other countries, at least insofar as America's goals include peace.

Gowa opens by arguing that there are no compelling a priori reasons to think that democracies would not fight one another. Democratic leaders are just as self-interested as others; democratic institutions should in principle constrain leaders no more than autocratic ones; and high trade levels should not prevent war inasmuch as states have incentives to continue trading during hostilities. Although Gowa's arguments make sense under certain rational-choice assumptions, scholars working under different assumptions will be unmoved. For example, much of Gowa's skepticism about democratic institutions rides on her assumption that leaders are not myopic (pp. 21–3). Many scholars would be delighted to find one such leader in the real world.

More compelling are empirical findings that suggest the democratic peace is an artifact of the Cold War. Based on an examination of pairs of states between 1815 and 1981, Gowa

finds no statistically significant relationship between democracy and peace before 1946. The same results obtain when the dependent variable is either militarized interstate disputes (MIDs) or alliances. What is more, she finds that before 1904 democracies were *more* likely to get into MIDs and *less* likely to ally with one another. But the relationships among democracy, peace, MIDs, and alliances are robust from 1946 to 1980, which suggests that either democracies themselves have changed (a hypothesis Gowa argues has insufficient theoretical support) or some omitted variable accounts for the post–World War II peace among democracies. The omitted variable, Gowa argues, is interest. During the Cold War, democracies did not fight one another because they faced a common physical threat, the Soviet Union, not because they were democratic.

Gowa's empirical inferences about the democratic peace turn on some dubious operations on the data set. An earlier criticism called these operations ad hoc (Zeev Maoz, "The Controversy over the Democratic Peace: Rearguard Action or Cracks in the Wall?" International Security 22 [Summer 1997]: 162-98); Gowa now attempts to justify them theoretscally. Her first and more serious move is to eliminate the two world wars and thereby 59.1% of all the warring dyads (p. 48). This she justifies by subtly changing the central question from "Do democracies ever fight one another?" to "Do democracies ever fight one another in 'non-general' wars?" The problem with general wars, she contends, is that they have a distinct set of causes, in particular "buck passing" and other diffusion mechanisms (p. 47). Whether or not that contention is correct, Gowa never explains why diffusion mechanisms would upwardly bias the democracy coefficient.

Gowa's second move is to chop the remaining data set into three periods: 1816-1913, 1919-38, and 1946-80. A chisquare test shows that the p-values, or probabilities that random chance could account for the democratic peace, are 0.42 in the first period (0.21 if Spain is not counted as democratic in 1898), 0.17 in the second, and 0.004 in the third (pp. 61-2); thus, the peace among democracies is indeed more impressive as one moves through time. Gowa grounds this second move on the proposition that the structure of the international system differed in these three periods (p. 55): 1816–1913 was multipolar, 1919–38 "unstable," and 1946–80 bipolar. Yet, suppose we consider the interwar period to be multipolar (it was arguably no less stable than 1890-1914): combining 1919-38 with 1816-1913 yields a p-value of less than 0.015, a figure that would stimulate the salivary glands of any betting person.

Gowa's claim that the peace among democracies is significant only during the Cold War, then, is problematic. It turns on an arbitrary change in the dependent variable and a highly contestable assertion about the structure of the international system between the world wars. Yet, her findings that democracies are significantly likely to get into MIDs and significantly unlikely to be allies before 1914 do challenge those scholars who assert that the democratic peace implies generally smoother relations among democracies. Gowa's results suggest that democracies begin to favor one another most during crises, that is, their preferences are fluid rather than fixed.

Gowa's positive argument—that the allegedly democratic peace is an artifact of common security interests produced by postwar bipolarity—has been challenged elsewhere for its use of alliances as proxies for interests (William R. Thompson and Richard Tucker, "A Tale of Two Democratic Peace Critiques," Journal of Conflict Resolution 41 [June 1997]: 428–54). Thompson and Tucker report that anocracies, or

states with both democratic and autocratic properties, are significantly likely both to be allies and to get into MIDs. Because common interests would imply fewer MIDs (assuming fixed interests), alliance portfolios are not good proxies for interests. In response, Gowa here offers an historical narrative of major-power relations in various periods to demonstrate that interests and alliances generally coincide (pp. 70–82). This narrative is primarily a description of the rise and fall of various great power alliances, however, and thus is inconclusive. Moreover, it suggests, counter to Gowa's own argument, that domestic politics matters. Britain lost interest in an alliance with Austria-Hungary when the Conservatives took office in 1880, and Germany dropped its alliance with Russia in 1891 partly because of "political shifts within [Germany]" (p. 73).

Gowa undermines her own conclusions in two ways. First, she argues for a robust autocratic peace (pp. 103-8); but if such a thing exists, then states' domestic properties must matter, a proposition more compatible with the democratic peace program than with her structural realism. Second, she closes the book with policy recommendations that, according to her own argument, are superfluous. Gowa is concerned that U.S. policymakers actually believe in democratic peace and therefore are imprudently trying to spread democracy. But she has just spent an entire book arguing that democracies, like all states, always respond rationally to the imperatives of the international system. If the United States after 1989 is an exception to her universal rule of state rationality, then America and other democracies at other times could be as well. As soon as one acknowledges that ideas can affect international relations, one allows that there may indeed be a democratic peace.

International Relations on Film. By Robert W. Gregg. Boulder, CO: Lynne Reinner, 1998. 310p. \$55.00 cloth, \$22.00 paper.

Juliann Emmons Allison, University of California, Riverside

Robert Gregg makes it clear that popular culture has contributed more than Stanley Kubrick's manuacal Dr. Strangelove to our understanding of the world. According to Gregg, movies dramatize the people and events that mark the practice of world politics in ways that often challenge conventional wisdom about international relations, and they almost always provoke rousing discussion. His novel text emphasizes these points by reviewing 150 feature films in terms of contemporary theories of international relations and the evolution of the state system. Gregg's fluid exposition of the multifaceted union between films and the study of international relations exceeded my expectations for a supplemental introductory text on that topic. Perhaps most important, International Relations on Film offers instructors a valuable alternative means of reaching students who are increasingly technologically worldly yet remarkably uninformed about the world in which they live.

The text opens with an introduction to the ways in which film and international relations might be usefully related. More specifically, Gregg explains that feature films not only attach a picture to the thousands of theoretical and historical words that constitute the study of international relations but also increase our knowledge about the world. He is, however, quick to caution that the considerable degree of historical license permitted in film, combined with the tendency of predominantly American and European film makers to focus on the major conflicts of their times, make movies better teachers of war, in general, than of the particulars of peace.

The introduction is followed by ten substantive chapters, each of which focuses on a single concept—sovereignty, nationalism, intervention, espionage, crisis decision making, war, economics, international law, culture, and domestic politics—selected for its joint importance to international relations theory and prominence on screen. These chapters, as a whole, provide a nice review of major themes in international relations theory by demonstrating the ways in which the cinematic treatment of selected concepts support or contradict scholars' expectations about world politics. A reflective conclusion suggests that the persistence of these concepts in film over time, despite the emergence of such current issues and themes as the spread of infectious diseases and the role of women in positions of power, is a sign of continuity despite change in the practice of international relations.

Although Gregg does not in any way categorize the concepts emphasized in International Relations on Film, his discussion of a number of them, the norm of sovereignty and the principle of nonintervention in particular, follows a straightforward appraisal of their centrality to realism and the paradigmatic state system. The chapter on sovereignty, for instance, questions the enduring utility of the Westphalian territorial state. Considering the increasing consolidation of the world's advanced economies, despite the rampant diffusion of democracy and capitalism that has occurred since the end of the Cold War, is it reasonable to vest power ultimately in the independent and equal nation-state? In response to this question, Gregg uses The Mission to illustrate that the universality of the sovereignty norm was already debatable just a hundred years after its establishment. In that film, an agreement between Spain and Portugal to redraw the boundaries between their territorial possessions in South America sacrifices papal support for the Jesuit missions there as well as Church protection for the native Guarani Indians from predominantly Portuguese slave traders. Clearly, according to Gregg, European nations have thus long been more sovereign than other nations and cultures.

The chapter on the principle of nonintervention likewise questions the value of the state system. Here Gregg follows a theoretical discussion of nonintervention, or the absence of forcible or dictatorial involvement by one nation in the internal affairs of another, with a comparison of the onscreen exploits of the United States in Latin America to the failure of the international community to arrest the genocide in Cambodia under the Khmer Rouge. He presents Under Fire, in which the U.S. government and American journalists join Nicaraguans in revolt against the Somoza regime; Salvador, a fictional account of the murder of Archbishop Romero and the rape and murder of nuns during the U.S.-supported civil war in El Salvador, and Missing, wherein a man charges the United States with his son's disappearance and death during a military coup in Chile as indicative of the immorality of the U.S. clandestine intervention in Latin America. Gregg contrasts such "calculated and purposeful" intrusions with the failure of anyone at all to challenge the Khmer Rouge. Gregg's cinematic touchstone in this case is, of course, The Killing Fields, which chronicles a Cambodian interpreter's struggle to survive a slave labor reeducation camp following the Khmer Rouge takeover.

Another subtle categorization of concepts treated in the book includes chapters—such as those on economic interdependence, international law, and culture—that examine the myriad ways in which domestic and international institutions, broadly defined, shape world politics. The chapter on international law, for one, provides a fine comparison between

structural realism and institutionalism that emphasizes the importance of morality to a complete understanding of international affairs. Gregg uses Casualties of War, the story of American soldiers who are tried and court-marshaled for raping and murdering an innocent girl while on patrol in Vietnam, to illustrate how the moral disposition of individual nations may arguably assure the potential for ethical international relations.

Institutions also figure prominently in the chapters on economic interdependence and "the clash of civilizations," in which Gregg discusses the consequences of cultural miscommunication for international trade and finance. His focus is the late Cold War economic competition between the United States and Japan, which, Gregg argues, was exacerbated by the failure of principals on both sides to interpret cultural cues correctly. According to Gregg, this cultural clash resulted in the kind of American paranoia about Japanese influence in the United States featured in such films as Rising Sun and Gung Ho. Economic interdependence and antagonistic business practices dovetail in Rusing Sun, which casts a mercantilist Japan as a threat to the security of the United States on account of its favorable position in negotiations to acquire Microcom, a strategically valuable American computer software company. Interdependence takes a back seat to cultural confusion in the comedy Gung Ho, which pits American individualism against Japanese company loyalty when "Assan" saves Hadleyville, Pennsylvania, by taking over that town's dying automobile plant.

Even the very selective summary of theories and films provided here is sufficient to show that International Relations on Film fulfills Gregg's purpose for writing it, that is, to demonstrate the ways in which feature films highlight certain aspects of world politics. It is a pity he stopped there. Gregg's juxtaposed reviews of international relations theory and selected films imply that popular and scholarly perceptions of critical issues of world politics, such as armed intervention or economic liberalization, often diverge. What does this mean for politics? Whose version of the reality of international crises and other events matters? A quality response to questions such as these could have elevated Gregg's otherwise very informative and entertaining textbook to the level of essential reading for anyone doing research on the relationship between the public, if not pop culture, and foreign policymaking.

Resolving Regional Conflicts. Edited by Roger E. Kanet. Urbana: University of Illinois Press, 1998. 257p. \$31.95 cloth, \$21.95 paper.

Patrick M. Regan, State University of New York at Binghamton

The end of the Cold War has had numerous effects on the study of world politics; two of the more visible have been to focus scholarship on (1) intrastate conflict in addition to interstate conflict and on (2) regional, as opposed to global, explanations. This seems rather odd when so much of our daily life is bombarded with notions of globalization. The volume edited by Kanet is another example of efforts to look to the uniqueness of regional relationships for explanations of general phenomena. There are both costs and benefits to this approach.

The volume consists of ten chapters, each of which addresses some aspect of regional conflict. These chapters do not cohere well. Some focus on a conceptual framework with which to think about regional conflict and its management, some on specific conflicts, some more broadly on regions, and

some on mechanisms for the management of conflicts. What is missing is an introductory chapter that provides a framework to which each chapter can be linked. For example, in chapter 1 Edward Kolodziej develops a way to think about regional security communities. His hierarchical model of a security system reflects the "degree to which the states and people of a region are willing to resolve their differences and govern their interdependent affairs through peaceful bargaining and negotiations rather than through coercive threats and force" (p. 16). The model is useful, even though it implicitly assumes that the differences across regions provide most of the variation in the degree of conflict. None of the other contributors use this conceptual framework to guide their analysis.

The following three chapters focus exclusively on the Irish or the Pakistani conflict. In order, they are an anthropological treatment of the background to the Irish conflict, a normative treatment of the case for impartiality in efforts to manage that conflict, and an historical description of the issues involved in Pakistan's regional security. None of these chapters even hint at the usefulness of Kolodziej's theoretical framework, and even the successive chapters on Ireland do not seem to be linked in any useful manner.

The fifth chapter, by Stephen Cohen, presents another useful framework for thinking about the specific regional aspects of what he calls "paired minority conflicts." He correctly assumes that the conditions for peaceful relations can be identified through an understanding of the causes of conflict. He then asks and answers: "How are psychological minorities created out of physical majorities" (p. 110)? A number of factors, he posits, contribute to this, such as traditions, domestic sources of external perceptions, and generational experiences. His thinking then leads to coping strategies for threatened minorities, not all of which would seem to be at the immediate disposal of the threatened group, but they surely represent theoretically possible alternatives. This chapter, like chapter 1, does not appear to help shape the thinking of some of the more case specific chapters. In many ways this is unfortunate.

Part III starts with a philosophical discussion by Paul Schroeder. Again, the connection to an overall theme of the volume is lost in the walk through political history, power politics, and "utopian" ideas. An assumption at the core of his argument is that "the fundamental causes of war have not remained the same in different regions and eras" (p. 143). To many this assumption is questionable, even though it is consistent with the organization of the volume. Schroeder articulates three sources of what he calls "utopian hopes," none of which "has ever worked or ever can": realism, legalism, and normative or peace through justice ideas. The remaining chapters focus on the role and success of peacekeeping efforts in various conflicts. Paul Diehl examines the conditions for success in Somalia, Cambodia, and the former Yugoslavia. Four factors are considered when evaluating the outcomes of each of the UN efforts: neutrality, geography, third-party behavior, and subnational actors. The next chapter, by Munck and Kumar, examines the effect of outside interventions in El Salvador and Cambodia, although they focus on a different set of criteria to judge intervention effectiveness. The two consecutive chapters that discuss the effect of peacekeeping operations in Cambodia focus on different criteria and come to different conclusions. Diehl argues that "UNTAC is generally regarded as a success" (p. 170), whereas Munck and Kumar conclude that some parts of the UNTAC operation had "negative effects," and in general the overall program achieved only limited success in Cambodia. The beauty of these chapters is that they give us specific criteria by which to judge intervention effectiveness, although the gist is that different criteria obviously lead to different evaluations. The last two substantive chapters focus on Eastern Europe and Russia, respectively, and have a similar fit to the overall volume.

I do not mean to give the impression that the volume is not useful, but it makes a contribution that is somewhat different from my initial expectations. I was teaching a course in conflict management at the time I reviewed this book, and my students had an assignment to analyze management efforts in a particular conflict. When they came to me for advice on how to approach a specific issue or problem, I found myself referring them to the individual chapters in Resolving Regional Conflicts. In their own individual ways, the contributors to this volume provide a useful overview of or framework for thinking about regional conflicts, either as background to a specific conflict or a general framework. So what becomes a liability in one intellectual environment is an asset in another.

Some of the discontinuity in the volume could be-and perhaps should have been—overcome by a more coherent job of editing and pressing the authors to hold to a conceptual framework. The underlying assumption in a number of the chapters, and surely in the Introduction and first chapter, is that the primary explanations for conflict can only be found by a regional focus, and this will remain debatable. There is little in the volume to convince me that a focus on more general explanations should give way to regionalism. Certainly, any effort to manage conflict effectively should be attuned to the unique contribution of a specific environment, but the volume could have profitably adopted a general framework that was subsequently applied across a number of regional conditions. In the end the book should be considered more for the independent contribution of each chapter than for its contribution to our theoretical understanding of the resolution of regional conflicts.

The Currency of Ideas: Monetary Politics in the European Union. By Kathleen R. McNamara. Ithaca, NY: Cornell University Press, 1998. 185p. \$39.95 cloth, \$16.95 paper.

Monetary Politics: Exchange Rate Cooperation in the European Union. By Thomas H. Oatley. Ann Arbor: University of Michigan Press, 1997. 222p. \$49.50.

Political Economy of Financial Integration in Europe: The Battle of the Systems. By Jonathon Story and Ingo Walter. Cambridge, MA: MIT Press, 1997. 337p. \$25.00 paper.

Aspects of European Monetary Integration: The Politics of Convergence. By Alison M. S. Watson. New York: St. Martin's, 1997. 226p. \$29.95 paper.

Richard Deeg, Temple University

How can one explain the emergence and consequences of exchange rate cooperation and monetary union in the European Union? This, very broadly, is the question that unites these four books

Story and Walter provide a highly detailed and exhaustively documented historical account of "the politics and diplomacy surrounding the EU's financial services area, exchange-rate regimes, and repeated attempts to make a big leap to monetary union" (p. 105). The first three chapters review the history of negotiations over the European financial services area (i.e., the creation of a single market in financial services) and monetary union politics in Europe, including efforts at exchange rate coordination and the macroeconomic imperatives associated with this. In my as-

sessment, the key point of the book lies buried in the middle of chapter 2 (p. 42): It can be deduced from macroeconomic theories that once European states committed themselves to fixed exchange rates (essentially starting with the European Monetary System in 1979) the logical implication is much deeper economic and political union. The authors marshal a great wealth of detail to show how this dynamic has played out and that although the ultimate outcome (deeper union) is predictable, getting there is anything but simple, as member states, financial market actors, and central banks fight for their divergent interests.

To the credit of Story and Walter, they view monetary and exchange rate cooperation as part and parcel of the much broader process of integrating financial markets in Europe and, ultimately, the broad political project of European integration. Thus, chapters 4–8 are devoted to explaining the distinctive national financial market models—and, by extension, distinctive brands of capitalism—that exist in Europe (with separate chapters on France, Germany, and the United Kingdom). For Story and Walter the politics of financial market and monetary integration, especially from the mid-1980s forward, are driven largely by the divergent structural interests associated with each of these models. Yet, as integration proceeds, they foresee inevitable convergence among them.

One strength of *Political Economy* is that it illustrates the complex issue linkages—security, economic, political, and social—involved in negotiating the path to further integration. Its chief weakness is that it does so (mostly) as a straight historical narrative largely bereft of an explicit theory of integration or international cooperation. More troubling, however, is that the book often gets lost in its own detail, and the logic of its organization is never really transparent until the end. Indeed, I recommend that a reader digest chapter 10 and the Epilogue first, as it is there that the link between the historical account and central analytical themes is finally conveyed.

Watson's book uses various international political economic and macroeconomic theories, as well as public choice models of politics, to analyze the pressures in favor of economic and monetary union (EMU) and the specific economic and political challenges member states face in realizing and sustaining it. The first three chapters provide an historical overview of monetary integration efforts, starting with the largely failed Snake of the early 1970s through EMU in the 1990s. Watson portrays the drive to monetary integration as the result of numerous, mutually reinforcing economic and political forces, ranging from the growth of international capital mobility to domestic political interests (e.g., taming inflation) to geopolitical imperatives (e.g., binding reunified Germany to the integration project). As do Story and Walter, Watson takes the position that monetary and exchange rate cooperation are inextricably linked to the single-market project and especially financial market integration in Europe, that is, progress in all these areas must more or less go together (p. 51).

Watson's primary subjects of analysis, however, are the convergence criteria laid down in the Maastricht Treaty, which were to be met before any member state could join EMU. Watson is particularly interested in analyzing the economic and political rationale behind the selected convergence criteria, that is, which theoretical arguments were, or could be, used to argue the necessity for creating them. She also analyzes the respective difficulties member states are likely to encounter in meeting them as a result of divergent domestic institutions and the implications of these criteria for domestic politics and policies. In separate chapters she does

this analysis for each of the convergence criteria—price stability, budgetary conditions, and interest rate and exchange rate convergence.

Ultimately, Watson aims not so much at making an independent theoretical argument that explains the why and how of EMU as at reviewing established theories and models and employing them to elucidate the causes and consequences of EMU. The character of the work is more that of a textbook, particularly since the author devotes significant portions of numerous chapters to reviewing various theoretical models and literature before applying them. For readers particularly interested in EMU and the convergence criteria, this is a useful book. For readers who are looking for more innovative uses of theory and provocative analysis of exchange rate cooperation and monetary integration, read on.

Why would states give up their national currencies, a key component of sovereignty? Why would political actors from both the Left and Right agree to give up monetary policy autonomy? These are the leading questions McNamara sets for herself in analyzing three episodes of monetary cooperation in Europe: the Bretton Woods system, the Snake from the early 1970s, and the European Monetary System (EMS). In setting up her own model, McNamara first reviews four theories of international cooperation-hegemonic stability theory, business cycles and cooperation, institutional asymmetry, and interest group theories—that could be used to explain the creation and success/failure of each of these three historical cases. She finds deficiencies in all these theories for explaining the Snake and EMS, the two purely European efforts at exchange rate cooperation. McNamara then constructs her alternative theory, which she builds upon Mundell's "Holy Trinity": "Policymakers can choose only two out of three policy options at any one time: free capital flows, a fixed exchange rate, and monetary policy autonomy" (p. 44). McNamara argues that rising international capital mobility, starting in the late 1960s, forced European policymakers to choose between the two remaining options: pursuing a fixed exchange rate system with other European states or preserving domestic monetary policy autonomy.

From this position McNamara argues that the Snake failed because policymakers tried to eat their cake and have it too, that is, maintain fixed exchange rates while pursuing independent (and divergent) monetary policies in a world of rapidly increasing capital mobility. When push came to shove, European policymakers abandoned any real commitment to fixed exchange rates. The EMS, in contrast, was quite successful. The difference this time was that policymakers finally recognized that high capital mobility made the cost of "squaring" Mundell's "trinity" prohibitive. But they could still choose between a fixed exchange rate regime and monetary policy autonomy, and they chose the former. Why? The answer, for McNamara, is the power of ideas. European policymakers went through a learning process in which they first had to accept that their cherished Keynesianism would no longer work. But they needed a policy paradigm with which to analyze the world, and monetarism, buoyed by the successful example and proselytizing of Germany, became their beacon in the night. In the late 1970s and early 1980s policymakers across Europe gradually converged around a monetarist, low-inflation macroeconomic policy model. But this policy convergence does not itself explain the decision to abandon independent monetary policy for EMS. McNamara argues that policymakers were committed to fixed exchange rates because they considered it important for facilitating intra-European trade and reducing the complexity and cost of administering the Common Agricultural Policy. Mc-Namara closes with a brief analysis of EMU, which she sees

as a natural progression from EMS, especially in light of ever greater international capital mobility.

McNamara's book is tightly and cogently organized. The narrative is well written, and theories are lucidly presented and analyzed. The author adopts the capital mobility hypothesis (which argues that rising capital mobility forces policymakers to pursue convergent monetary policies), but she fills in some of its gaps in arguing that, although capital mobility may create a structural constraint upon state behavior, states still have choices as long as they are willing to pay the price. McNamara's solution—and important theoretical contribution—is grafting the capital mobility thesis onto an argument about the importance of ideas and how policymakers come to their decisions within these constraints. In these respects the book is triumphant. But there are some significant soft spots, and I note two here.

First, McNamara essentially takes the position that domestic interest groups do not matter all that much when explaining policymakers' decisions about exchange rate cooperation in Europe (p. 59). But given the fact that exchange rate policy is tightly linked to monetary (interest rate) policy, about which domestic interests undoubtedly care a lot, and that there are many empirical and theoretical arguments to the contrary (Oatley, to whom I turn next, for example), she needed to bring forth much greater empirical data to support this position.

Second, McNamara makes a plausible argument that monetarism became the new policy paradigm across Europe, but given the centrality of this to her argument, she devotes relatively little detail to tracing out the process by which these ideas infiltrated policymakers' thinking and determined their decisions. This is all the more important because others (such as Oatley or Story and Walter) suggest that European policymakers, once they committed themselves to fixed exchange rates, had little choice but to toe the line of monetary rigor drawn by the Bundesbank. This was not so much because of monetarist convictions (which they may have indeed held) as because the Bundesbank was the actor that captured the exchange rate system's single degree of freedom, that is, it set the monetary policy for everyone: The Bundesbank was the tail that wagged the European dog. McNamara chooses to portray the Bundesbank's influence as deriving from its success in persuading other European policymakers of the correctness of its economic philosophy, not from the exertion of real hegemonic power. But the Bundesbank was not above using implicit but unmistakable threats (i.e., coercive power) to bring down any exchange rate system that did not meet its demands (see Oatley, p. 63).

Oatley deftly welds together economic and public choice theories, statistical analysis, and historical case studies to produce a sophisticated and superb book in which he addresses two primary questions. First, how can one explain the creation and evolution of European exchange rate institutions? Second, how can one explain the significant cross-national and longitudinal variation in European policymakers' ability to stabilize exchange rates within such institutions?

In answering the first question, Oatley juxtaposes his own explanation with neoliberal institutionalism, which explains international institutions as arising in order to realize gains from cooperation. He critiques this as a functionalist argument that therefore inadequately explains the motives driving the creation and evolution of such institutions. The theory also neglects the distributive elements embodied in international institutions. Without completely rejecting neoliberal institutionalism, Oatley uses public choice theory to develop an alternative model resting on the premise that "explaining the creation and evolution of exchange rate institutions and

variation in policymaker's ability to stabilize exchanges rates within these institutions requires domestic politics-based models of monetary policy and models of [international] bargaining power" (p. 4). In neoliberal institutionalism, institutional evolution is driven by the quest for additional gains from cooperation. In Oatley's model, it is driven by the redistribution of existing benefits as joint gains from cooperation erode (p. 181). Thus, the EMS was initiated by Helmut Schmidt and Valéry Giscard d'Estaing to assist each of them in advancing their respective (and distinctive) domestic agendas, and changes in EMS institutions were driven by actors' attempts to shift the costs of cooperation and/or increase their benefits from cooperation.

In answering the second question, Oatley juxtaposes his model against the capital mobility hypothesis (CMH). Echoing McNamara, Oatley notes that the CMH does not say why policymakers chose fixed exchange rates rather than monetary autonomy and why they converged around the Bundesbank's preferred standard. But in filling these gaps, he diverges from McNamara. Using European cases, Oatley conducts a statistical test of the CMH against his domesticpolitics based model of monetary policy. He finds little support for the CMH and significant support for his model, with the exception of the French and Italian cases, where Left-leaning governments pursued monetary restriction, counter to the predictions of his model. Oatley ultimately saves his model by examining the French and Italian policy shifts in the 1980s through extensive case study analysis. McNamara explains this shift by arguing that these leftist governments became monetarist converts, but Oatley relies more on the achievement of coalitional stability, the ascendance of proprice-stability factions within dominant parties, and increased central bank independence to explain the policy shifts in France and Italy. It was not capital mobility that forced policy change—indeed, Oatley argues that policymakers in both countries limited capital mobility for much of the 1980s—but changes in domestic politics. Moreover, pragmatic policymakers in both countries used the EMS institutions to help them loosen domestic institutional barriers to a tight money policy and fiscal austerity. Only after these policymakers prevailed in the domestic arena (after 1983) could there be convergence in monetary policies and nominal exchange rate stability in EMS.

A criticism I have of both McNamara and (to a lesser extent) Oatley is that their models do not attempt to endogenize and systematically assess the influence of a broader and more general commitment by European political leaders to advancing European political integration, or how decisions in other policy areas, such as financial market integration, affect decisions about monetary policy and exchange rate cooperation. For example, the French decision to remain within the EMS in 1983 rather than pursue an independent economic strategy may well have been more-or at least as much—a result of a decision not to sacrifice the greater European project than a decision for the policies and politics of austerity (or monetarism). This connection between the broader political commitment to integration and specific decisions that constitute integration is brought out clearly by Story and Walter and Watson in their analyses.

Altogether, these four books provide a wealth of empirical and theoretical material on exchange rate cooperation and monetary union in Europe. If one could read only one of them, Oatley's book is the clear choice. Yet, I hasten to add that reading McNamara and Oatley in tandem yields a stimulating theoretical discourse. Finally, although all these books were completed when the move to full EMU was still

uncertain, much of their analyses is still very useful for understanding the current developments and future of EMU.

National Self-Determination and Secession. Edited by Margaret Moore. New York: Oxford University Press, 1998. 285p. \$65.00.

Stephen M. Saideman, Texas Tech University

Yugoslavia's violent disintegration revealed that self-determination is difficult to apply in practice. Because the right of self-determination applied only to colonial territories (narrowly defined) from the end of World War II to the end of the Cold War, the complexity of self-determination was overlooked until recently. This book presents a debate about whether and which groups should be allowed to secede.

Margaret Moore introduces the book by delineating three lines of thought: just cause theories, choice theories, and theories of national self-determination. The first half of the book presents these ideas, and the last three chapters are more empirical. One striking omission (although the last three contributions come close) is a defense of the old conventional wisdom that the right of states to their territorial integrity is superior to a group's right to self-determination.

Ironically, Allen Buchanan's book, Secession: The Morality of Political Divorce from Fort Sumter to Lithuania and Quebec, 1991, which has set the terms of the debate, was a challenge to the conventional wisdom of the time, as it seemed to grant more support for secession than previously allowed. Yet, in subsequent debates and in this volume, he presents the most restrictive view of the right to self-determination. Buchanan argues that the right to secede is a remedial right, like the right to revolution. A group should be allowed to secede only if it faces persistent violations of human rights or had been previously free. Of course, how one determines whether either condition exists is quite difficult. Furthermore, Buchanan is quite clear in arguing that no groups deserve support if they are seceding from a legitimate democracy (p. 17). Thus, the Quebec separatists do not have a legitimate case, according to Buchanan. Canadians outside Quebec would agree with his key point that easy terms of secession would make it possible for a minority to blackmail the majority.

Wayne Norman supports Buchanan's restrictive view by arguing that a less restrictive right to self-determination would encourage more secession, which would provoke more violence. This assumption, present in many of the other chapters, stands on perhaps the weakest empirical grounds. Events in East Timor may have encouraged the Acehnese to intensify their efforts to become independent because they were both responding to the same pivotal actor, the government of Indonesia, but East Timor matters less for groups in other states (David Lake and Donald Rothchild, *The International Spread of Ethnic Conflict*, 1998). Norman seems to be on better ground when arguing that a restrictive right to self-determination would improve the plight of groups by providing states incentives to be less oppressive (p. 44).

Kai Nielsen argues (as does David Miller in a separate chapter) that nations are entitled to self-determination and that it would be best for each nation to have its own state, converting Ernest Gellner's (Nations and Nationalism, 1983) definition of nationalism (a nation is a group that seeks to have its own state) into a right. Nielsen maintains that this right to secession is based on the individual right to autonomy that liberalism values. Interestingly, Nielsen applies his analysis only to advanced liberal democracies as a direct challenge to Buchanan. Nielsen qualifies his argument by suggesting that ethnic nationalism is to be condemned but liberal

nationalism is to be celebrated and rewarded because it is not exclusivist (by definition). Liberal nationalism in a liberal democracy aims to protect a culture of a nation but will, according to Nielsen, not harm the cultures of others. Since ethnic nationalism tends to spawn more secessionist movements (it is not clear whether liberal nationalism exists in reality), it is not clear whether Nielsen's argument can be applied.

Daniel Philpott largely ignores nationalism in his argument for an equally general right to secession. He views self-determination as a form of democracy. We ought to take senously (by analyzing) his argument that allowing secession to take place may result in less violence than in denying groups secession. He ultimately maintains that his views would not condone many more secessionist efforts than Buchanan's, which raises more questions than it answers.

The other contributions to the volume raise important questions about many of the assumptions in the previous chapters. Moore emphasizes the territorial nature of secession but believes that boundaries by themselves do not or ought not to have moral force. Beiner challenges the liberal basis of the previous chapters by arguing that a focus on rights increases conflict, since rights are about the creation and enforcement of boundaries between individuals (p. 162). John McGarry focuses on postsecession politics for both minorities and majorities in the new state, arguing that secession is likely to solve very little.

Donald Horowitz's contribution challenges the more permissive views of self-determination. It raises a crucial problem that most of the authors overlook or downplay (e.g., Nielsen, p. 123), namely, that in any society, multiple identities coexist, and the salience of each depends on the political context. Consequently, to say that one nation is deserving of self-determination privileges one identity at the expense others, which may reemerge in the new state and/or in the rump state. This not only is likely to lead to conflict after the secession but also raises a critical issue that this book was supposed to address: Who is the self that is determining its future?

Finally, Rogers Brubaker, in a piece written for another book, argues that nationalism has been misconceived. There are two problems with this chapter. First, only part of it fits with the rest of the volume—when he argues that there is no one-size-fits-all solution to ethnic conflict. Second, it does not serve well as a conclusion to the volume. Although the book should not end with a definitive stance on the issues (that is not its purpose), the final chapter should have suggested where the debate ought to go in the future.

This book provides an excellent summary of a very lively debate. It would be useful in upper division undergraduate courses and graduate courses in political theory, both for its debate about rights and for its application of liberal and communitarian theory to live, on-going, policy-relevant issues. For that reason alone, this book also would be of value to courses in ethnic conflict.

The Choice for Europe: Social Purpose and State Power from Messina to Maastricht. By Andrew Moravesik. Ithaca, NY: Cornell University Press, 1998. 514p. \$59.95 cloth, \$22.50 paper.

Jeffrey J. Anderson, Brown University

Andrew Moravcsik addresses a central puzzle in the study of European integration: Why have sovereign governments "chosen repeatedly to coordinate their core economic policies and surrender sovereign prerogatives within an international institution" (p. 1)? The resulting uniqueness of the European Community (EC) demands a convincing explana-

tion. The conventional wisdom, Moravcsik argues, has accorded far too much weight to geopolitics, such as the goal of binding Germany to the West or the pursuit of a federal vision of Europe, in shaping the development of the European project since the 1950s. Supranational actors also have received undue credit for driving the integration process and directing its institutionalization. The reality is quite different. The EC emerged as the result of rational decisions made by member governments in pursuit of core economic interests. Over the course of forty years, choices for Europe crystallized not because of supranational influence but from the relative bargaining power of the three largest member states: France, Germany, and Britain. European institutional arrangements were designed to enhance the credibility of commitments among governments, not to achieve a federal Europe or to realize procedural efficiency.

To support these revisionist claims, Moravosik presents a "rationalist framework" (p. 19), an eclectic construction assembled from diverse schools in comparative politics, international political economy, and international relations. He examines five grand bargains, starting with the Treaty of Rome and concluding with the Maastricht Treaty, and he parses each into three temporal-analytical stages: preference formation, interstate bargaining, and implementation. Attached to each stage is a set of competing hypotheses: for stage one, the relative importance of economic versus geopolitical interests; for stage two, the relative importance of national versus supranational actors; for stage three, the relative importance of credible commitments versus an assortment of considerations, including Europeanism and technocratic efficiency.

Moravesik maintains that his aim "is not to close the debate over the fundamental causes of European integration but to renew it" (p. 85). The ensuing analysis, in which methodological rigor is a running theme (more on that below) and conventional wisdoms are swept away time and again, leaves little doubt that he is trying to accomplish both simultaneously. His innovative framework is surely worth exploring further. Although Moravesik succeeds in shifting the theoretical debate away from the stale reference points of the EC studies literature toward general social science concerns, his approach raises many questions. Is it analytically sound, for example, to separate preference formation from bargaining, or bargaining from implementation, given the potential for interactive effects? The structured narratives in this book hint at such recursiveness, but clearly a more extensive discussion is warranted. The author also provides new grist for a mill constructed in the early 1990s—the debate over the relative importance of the European Commission and the member states in advancing integration. Moravesik was a protagonist in this scholarly exchange, and his critics will have their hands full trying to rebut the new evidence suggesting that governments rule the European roost

The author's most revisionist claim—national economic interests are the main motor of integration—is also the least convincing. Few contemporary observers of the European Union will be surprised to learn that difficult negotiations over the Common Market, economic and monetary union (EMU), and other economic initiatives were the occasion for intense lobbying by domestic producer groups advancing not geopolitical but economic interests, and that the resulting interstate bargains represented carefully crafted compromises over matters of economic substance. In short, coordinating "core economic policies" (p. 1) tends to call forth economic interests, economic disagreements, and economic compromises.

Moravcsik admits as much in the opening chapter, and were that the sum total of his argument, it would be unlikely to generate much controversy. What gives the thesis bite is that he consistently relegates geopolitical interests to the causal sidelines: They influence bargaining outcomes on the margins and only within parameters set by the primacy of economic interests. What is extraordinary—and here one must tip one's hat to Moravcsik for faithfully presenting the data—is that these marginal effects invariably impart true distinctiveness to the European project, that is, why it emerged not as a simple free trade area but something more, and why its supranational components have been augmented and strengthened over the years. Indeed, Moravcsik acknowledges the special nature of geopolitical effects but downplays their significance. This is odd, given the book's central puzzle.

Minimizing the import of geopolitics often takes on needlessly provocative dimensions. Many readers will be puzzled by Moravcsik's portrayal of national leaders, including Charles De Gaulle, who behaves more like the French Minister of Agriculture than president of the Republic. His conclusion that German unification had no effect on the Maastricht Treaty negotiations is frankly incredible. True, EMU was on the agenda at least two years before the Berlin Wall came crashing down, and the German chancellery and Foreign Ministry supported the initiative. At no time during this period, however, did the Germans commit to a firm deadline for the introduction of a single currency, despite the entreaties of EC partners and commission officials. Unification rendered Germany's qualified—perhaps even empty commitment to EMU unsustainable. For geopolitical reasons, Helmut Kohl brushed aside the concerns of the Bundesbank and Finance Ministry, much as he did in 1990 over the terms of German economic and monetary union, and committed his country to a firm timetable. Moravesik's narrative disregards this crucial shift in the German stance on EMU.

In the realm of method, Moravcsik makes a very strong claim about the data that underpin his analysis. In contrast to previous studies of integration, which relied on secondary literature and "soft" primary sources (memoirs, official press releases, interviews, and the like), which are inherently prone to bias or distortion, this book is based overwhelmingly on "hard" primary sources. Moravesik concedes that in many instances, because internal government documents are still under lock and key, he is forced onto softer ground; nevertheless, he assures the reader that only facts gleaned directly from "hard" primary sources are extracted from the secondary literature, not interpretations or conclusions of the author in question. All well and good. Yet, on closer examination, there is little to distinguish this book from other monographs that attempt to test theory by means of qualitative empirical analysis. In five case study chapters spanning 386 pages, there are 917 footnotes altogether, about 2% contain references to internal government documents, the hardest of "hard" primary sources. Secondary sources, not to mention political memoirs and other soft primary sources, make up the remaining 98%. Moravcsik also relies frequently on open-ended interviews he conducted during the 1990s. The reader is left to wonder why his subjects, who include acting and former prime ministers, a European Commission president, and other high-ranking officials, would be less inclined than those quizzed by other scholars to put a favorable spin on events in response to questions posed by someone whose work was sure to be widely read.

This aspect of the book's methods would be a minor matter were it not given such emphasis by the author and were it not used to dismiss entire bodies of scholarship, such as historical institutionalism (p. 491), for relying too much on secondary sources. It also leads Moravcsik to questionable conclusions; for example, he quotes an internal German government document that appears in Timothy Garton Ash, In Europe's Name (1993), to support his contention that economic interests drove Helmut Schmidt's approach to monetary cooperation in the 1970s (p. 254). Nowhere mentioned is Garton Ash's subsequent observation that the verb employed in the German text (abdecken) is also strongly suggestive of parallel and reinforcing geopolitical motivations. This simply underscores that there is no such thing as an unvarnished fact, particularly where the written word is concerned, and that scholars have an admittedly difficult obligation to grapple with both facts and interpretations drawn from all manner of sources if they hope to arrive at a complete picture.

In the summary chapter, Moravesik describes the European Union as "an institution so firmly grounded in the core interests of national governments that it occupies a permanent position at the heart of the European political landscape. Therein lies the political achievement and the ongoing social-scientific puzzle" (p. 501). He is surely right. One can only hope that EC scholars, in responding to his invitation to join a renewed debate, will choose to focus on real issues of substance, of which there are many in this volume, and not be distracted by contentious overstatements, of which there are, alas, many here as well.

Power Ties: Economic Interdependence, Balancing, and War. By Paul A. Papayoanou. Ann Arbor: University of Michigan Press, 1999. 193p. \$50.00.

Mark R. Brawley, McGill University

In recent years, scholars have aimed to gain better insight into international relations by incorporating material from various subfields. This can be seen in the melding of subjects within security studies and international political economy; it can also be observed in the closer attention paid to causal arguments drawn from several different levels of analysis. Taking up these challenges simultaneously has been difficult, and often the resulting works fail on one or more counts. Often, important themes clash within the text. In *Power Ties*, Paul Papayoanou has taken up these tasks and masterfully handles the various elements. The book stands as an excellent example of the sort of work of which we should expect to see more in the future.

Papayoanou takes on a classic theory in international relations: balance of power. As he notes, this well-known and well-worn phrase covers a number of very different arguments; he selects as principal targets for criticism the versions presented by Realists such as Kenneth Waltz (and the later reformulation by Steven Walt into a theory of states balancing against threats). The criticisms raised, however, are more in the nature of a call for better specification of expected results and for recognizing contextual and situational variants. It is on these same grounds that Papayoanou then tries to redress the weaknesses of existing theories.

As the author's criticisms suggest, remedies can be found in elaborating the different factors that affect how status quo powers react to the threats posed by revisionist states and in clarifying the factors that encourage revisionist states to pursue an alteration of the international status quo. Such factors can be found in both the systemic and domestic political and economic spheres. What is innovative about Papayoanou's approach is the way in which the logic of signaling games is employed to organize and integrate the material from different traditions and theoretical approaches.

Yet, those who try to incorporate theories based on different assumptions face a barrier. How does one integrate the theories without undermining each element's coherence or meaning?

Papayoanou overcomes this barrier by using the logic of signaling (from game theory) to pull together material from different levels and traditions. He argues that leaders of status quo powers choose their strategy for dealing with revisionist challenges by calculating the effect of extensive economic ties with other status quo states or with revisionist states. The degree of ties between the status quo state and other defenders of the status quo shapes not only the leaders' perceptions of domestic support for an alliance but also the credibility of that alliance in the views of the potential ally and the revisionist power. This notion allows Papayoanou to bring together some existing arguments about economic interdependence deterring war and domestic politics as a constraint against playing power politics (as well as on decision making more generally), although in a fashion that respects the fundamental insights of Realism on great power alignments.

This integration does not come without a price, however. Because of the emphasis on perceptions of economic ties between states, the key evidence Papayoanou needs to present is difficult to grasp. It is not evidence of actual links per se, or even of public opinion on the links between economies, but rather the views of key decision makers concerning the public's views of ties between economies. Moreover, Papayoanou must show that such factors have played a key role in the behavior of particular states. A small amount of evidence carries much of the argument.

Nevertheless, the organization of the evidence shows off the strength of Papayoanou's views. The author first lays out the questions concerning a particular historical period, then presents the standard historiography for that period. That is followed by the typical interpretations found in the political science literature. This highlights the disjunctures between the two disciplines, a disjuncture that is understandable but uncomfortable for political scientists. The difference in interpretation is understandable given our different endeavors: Historians emphasize the uniqueness of events, whereas political scientists stress generalizable aspects of cases. Nonetheless, historians' detailed descriptions should prove useful for political scientists. Too often, however, details are lost, and historians routinely scold political scientists for running rough-shod over evidence. Papayoanou illustrates how a sophisticated argument can reconcile the differences between the historians' narratives and those generated by political science theories. The argument is sophisticated but not overly complex, so that it retains its applicability across a wide range of cases.

There are only a few areas in which the book could have been improved, and perhaps organization of the cases is the most significant. These are grouped historically (which is very helpful for appreciating the variance in views between historians and political scientists), but it might have been more useful to group cases together on a different basis. For instance, the model is supposed to give us insight into the actions of the revisionist powers, but the patterns there are not easily discerned because these cases are not presented together. It is easier to see the similarities in the strategies of the status quo democracies because these form the focal point of each chapter.

All in all, *Power Ties* is an excellent example of the sort of work we all should be aiming to complete: It addresses shortcomings in existing theories by complementing those arguments with insights from other theoretical traditions.

More important, this refinement is achieved by integrating the elements into a single logically coherent model. The book should be widely read within the field, both for its findings and for the manner in which Papayoanou resolves some of the pressing difficulties we all face in improving the generation, testing, and refining of theories in international relations.

Democracy at the Point of Bayonets. By Mark Peceny. University Park: Pennsylvania State University Press, 1999. 254p. \$55.00 cloth, \$18.95 paper.

Mi Yung Yoon, Hanover College

Although promoting democracy throughout the world has been a goal of American foreign policy in the twentieth century, U.S. pursuit of this goal has been inconsistent. Mark Peceny questions why the United States has chosen to adopt proliberalization policies, defined as the combination of support for free and fair elections and other efforts for liberal reforms, during its military intervention on some occasions but not on other occasions. He argues that, given the increasing significance of democracy promotion in American foreign policy, understanding this puzzle is important in its own terms (p. 3). To unravel this puzzle, he examines the record of U.S. efforts to promote democracy during military interventions using both quantitative analyses of those interventions in the twentieth century and case studies based on secondary sources and documentary evidence (p. 6). Specifically, he questions under what conditions the United States decides to promote democracy during its military interventions. Peceny uses realism and America's liberalism, two of the most frequently tested theories of international relations, as theoretical tools and examines which of these two plays the most significant role in shaping decisions.

The book has eight chapters, each of which begins with a brief introduction and ends with a nice summary. Following a short introductory chapter, chapter 2 quantitatively tests the relative effect of realist and domestic liberal variables on presidential choices during the military interventions. Peceny finds that the realist concerns provide the best explanation for the initial choices of presidents, whereas congressional pressure from the domestic liberal approach best explains their final choices (p. 45). In the four subsequent chapters, these findings are further examined through six case studies. These explain with clarity how the partisan dynamics in Congress shape the legislature's reaction to the intervention policies of presidents. Chapter 3 discusses U.S. interventions in Cuba and the Philippines after the Spanish-American War. Peceny states that liberal pressure from Congress against McKinley's nonliberalization policies in both countries compelled him to shift his initial decision to proliberalization policies in Cuba, but it failed to do so in the Philippines because of the warfare there and the dominance of the president's party in Congress after the new elections. The next chapter examines Kennedy's policies toward South Vietnam. Peceny argues that "the commitment to democracy was contingent on security considerations" during his administration (p. 92). Kennedy initially adopted prodemocracy policies toward Vietnam to serve U.S. security interests, but he abandoned these policies when the security situation in Vietnam appeared to warrant it. When Kennedy shifted to nonliberalization policies, liberal pressure from Congress was nonexistent or barely visible because liberal Democrats did not want to challenge their party's leader (p. 99).

Chapter 5 investigates U.S. military intervention in El Salvador during Reagan's first term, specifically, Reagan's policy shift from hard-line to proliberalization policies.

Peceny argues that realist considerations explain Reagan's initial policy choices, but congressional pressure reinforced by antiintervention groups provides a good explanation for the shift. This chapter reemphasizes the strength of domestic liberalism over realism in explaining final presidential choices. It is followed by a chapter on Clinton's proliberalization policies during U.S. military interventions in Haiti and Bosnia. Peceny argues that the end of the Cold War makes the present era the most conducive in U.S. history to the adoption of proliberalization policies, and "both the realist and the domestic liberal arguments are pushing in the same direction" (p. 8). Yet, he points out, U.S. support for proliberalization policies was limited in both cases because Congress and the public were reluctant to pay high costs or to use force.

Chapter 7 answers the "so what?" question by examining whether U.S. military intervention and proliberalization policies actually lead to successful democratization in the target state. Using multivariate analyses, Peceny finds that "the promotion of proliberalization policies during a military intervention rather than intervention itself has the most powerful impact on democratization in target states" (p. 199). The concluding chapter is not much more than a summary of the findings. Throughout the book, Peceny argues that when a president adopts proliberalization policies in reaction to congressional pressure, he does so to build domestic consensus for intervention. Thus, promotion of democracy has been used as an ideological tool for legitimizing U.S. military interventions.

The book is clearly written and well organized. By combining both quantitative analyses and case studies, Peceny presents the strengths that each approach can offer. The two quantitative chapters report robust findings of multivariate analyses, and the case studies and footnotes provide a wealth of detailed information. By focusing on presidents' policies during military interventions and examining the effect of proliberalization policies on target states, Peceny brings much freshness to the literature, which has focused on the factors of intervention.

The book is not without its shortcomings. Chapter 2 needs more thorough and expanded discussion on realism and America's liberalism to relate them to the realist and domestic liberal arguments on proliberalization and nonproliberalization policies. By drawing indirect military intervention cases from a single source, Peceny excludes some cases that could be qualified as indirect military interventions (e.g., Pakistan in 1971, Mozambique in the mid-1980s, Somalia in 1988). A table listing durations in days and months as well as years would have been useful, because they determine many of the findings of this study. To examine whether presidents' policies changed during an intervention, Peceny coded them "as proliberalization or nonliberalization in the first and last two months of their administration's policies during an intervention, or in the first and last week of interventions of shorter duration" (p. 19). This is an impressive accomplishment, since determining the beginning and ending dates of each military intervention is a challenging task. Conflicting dates are reported in the literature, and it is often difficult to know the dates for indirect military interventions because of their subtleness.

With no clear justification, Peceny argues that "the presidential selection process places limited constraints on presidents when it comes to the adoption of proliberalization policies during military interventions" (p. 28). Yet, a few of the case studies, especially Vietnam during the Kennedy administration, suggest that the presidential election, a statistically significant variable in other studies of U.S. military

intervention or use of force, may have played a larger role in shaping decisions than Peceny credits it. Therefore, I question whether the models in chapter 2 should include the presidential election as an independent variable.

The above comments should not outweigh the overall quality of the book. It is well written and provides an excellent account of the continuity and change in U.S. policies during military interventions by integrating the realist and domestic liberal approaches. I highly recommend this work to scholars and to advanced undergraduate and graduate students interested in U.S. military intervention and democratization.

The Myth of Global Chaos. By Yahya Sadowski. Washington, DC: Brookings Institution Press, 1998. 267p. \$28.50.

James H. Mittelman, American University

Yahya Sadowski, a professor at the Johns Hopkins School of Advanced International Studies, tackles a key problem in world order studies: Following the Cold War, what are the interactions between globalization and the outbreak of violence? And how can a sound diagnosis of this set of relationships inform the corpus of knowledge on conflict analysis and U.S. foreign policymaking? To get at these questions, he proceeds logically by setting forth the premises of chaos theory, critically assessing it through the use of qualitative and quantitative data, and drawing out the implications for political strategists.

According to Sadowski, "global chaos theory is an intellectually elegant construct, built on well-established traditions. It offered Americans a sense of direction, when the end of the cold war had sowed confusion and division" (p. 75). The theorists' core argument is that globalization spawns political violence, manifested in a rise of clashes, mainly explosions of cultural pluralism. They share a common view that societies in the grip of economic globalization experience jarring social disruptions and are, thus, prone to anomie, which in the Durkheimian sense depicts a condition of irrational violence and a shift, or in some cases collapse, of values. A disparate group, chaos theorists fall into different subschools in terms of their respective emphases: the collision of cultures worldwide, the role of economic forces as propellants of chaos, and "ethnonationalism" or "religious nationalism." For the most part, however, the purveyors of this theory are popularizers of its tenets. The proponents include leading journalists, such as Robert Kaplan; management gurus, such as John Naisbitt; futurists similar to the Tofflers; politicians, including Senator Daniel Patrick Moynihan; and scholars with broad appeal, Samuel Huntington being perhaps the best known among them. Tracing the chaos theses in diverse contexts—such as the Horn of Africa, central Africa, and the Balkans-Sadowski wends gingerly through a minefield of debates about the root causes of ethnic, religious, and intercivilizational

As the title of his book suggests, Sadowski finds that chaos theory cannot stand the test of evidence. Finely grained case studies and what he calls "back-of-the envelope" measures of globalization are, in an effort to detect correlations, compared with the frequency and range of culture strife. He lambasts Huntington, taking cognizance of various critiques of the "clash-of-civilizations" thesis, and pokes holes in global chaos theory, as propounded by Kaplan and other publicists. Notwithstanding its flaws, this way of thinking has had considerable influence in Washington, mainly as a series of epigrams that are used in sound bites, not as a vision or grand strategy. In conclusion, Sadowski presents his own recom-

mendations for U.S. foreign policy: greater flexibility, better experts, skillful diplomacy, military preparedness (not necessarily expanded budgets), and more support for economic development. These are conventional, decidedly less than novel, proposals.

Yet, the book makes an important statement insofar as it focuses on values and relates an intersubjective framework to political and economic conditions. This endeavor is valuable for readers who seek to understand the mindset in Washington and, more broadly, among U.S. foreign policy intellectuals. The book's virtues, however, are also its vices. An international audience is likely to regard this discussion of the views of predominantly U.S. writers as provincial, if not arrogant, inasmuch as it ignores seminal contributions emanating from countries whose structural positions in the global political economy differ from that of the United States. If Sadowski is interested in global chaos, why did he not decenter the debate and pitch it widely in terms of global scholarship, such as the well-known thesis on the "new medievalism," advanced as a globalization scenario by the late Susan Strange ("The Defective State," Daedalus 124, no. 2 [Spring 1995]: 55-75) in the United Kingdom, picking up on a seminal concept introduced by the Australian Hedley Bull (The Anarchical Society: A Study of Order in World Politics, 1977)? Strange considered the discourse among analysts in and around Washington without granting it the elevated status of "theory." Like other political economists, she knew its varied dimensions but in terms of "the Washington consensus," that is, the geopolitics and geoeconomics of neoliberalism, on which there is vast scholarship, a route that Sadowski chooses not to travel.

To be sure, Sadowski's subject is the *métier* of political economists, but the author does not venture far into this realm. Although the classical political economists put forth a sophisticated notion of social structure—Smith and Ricardo, as well as Marx, regarded class as a key factor—Sadowski's probings of social structure delve into ethnicity, religion, and gender, which are pivotal for explaining anomic violence, and barely touch on class forces.

In going much beyond the chronicling of manifestations of global chaos, and in searching for underlying factors, the author is right to attack purveyors of the notion of chaos. In my view, it is a catchall, too vague as a category and too blunt as a tool of analysis. The question then becomes: In this grab-bag, exactly what is chaos, and what links very different phenomena? Sadowski is, moreover, on the right track when he introduces the concept of globalization, but it is undertheorized in *The Myth of Global Chaos*. To add structural depth to this book, it would be worth considering the varied genres of globalization research and the positions of globalization theorists, who have examined the implications of a radically new division of space and a compression of time in terms of a lessening of social and political control over economic forces—in short, a global transformation of ways of life.

Apart from the silences noted above and the need to deepen the structural aspects of the analysis, *The Myth of Global Chaos* constitutes a lucid study of what is driving the major conflicts after the Cold War, and it pushes the debate about ways to understand them. All in all, Sadowski's engaging and ambitious work offers several salient formulations that challenge U.S. foreign policymakers and all those concerned with the dynamics of violence in a globalizing world.

States, Firms, and Power: Successful Sanctions in United States Foreign Policy. By George Shambaugh. Albany: State University of New York Press, 1999. 248p. \$21.95.

Daniel W. Drezner, University of Chicago

In the past decade, the American use of economic coercion has increased dramatically. Among the cases that have garnered the most attention are extraterritorial or secondary sanctions, such as the Helms-Burton Act and Iran-Libya Sanctions Act. These measures punish firms and individuals, rather than entire nations, for trading with countries embargoed by the United States. These sanctions pose a puzzle for scholars. It is commonly assumed that secondary sanctions do nothing more than mollify domestic audiences and needlessly rile allies. How can extraterritorial sanctions be explained?

States, Firms, and Power addresses this gap. George Shambaugh examines the post-1945 history of U.S. sanctions against foreign firms and discovers that the record of extraterritorial sanctions is more complex than previously thought. He argues that the effectiveness of these sanctions has been greater than expected (50% exactly). Success is dependent upon the trade dominance of the United States (the share of U.S. exports and imports in the relevant sector) in the industrial sector of the targeted firm, as well as the target state's trade dependence (the net utility the target derives from the trading relationship, given the opportunity costs of adjustment) on the U.S. market.

Shambaugh uses a social power framework to address the question of sanction effectiveness. This framework, in contrast to realism, claims that power is not a fungible resource. "Thus, unlike the structural models, issue- and context-specific models assume that trade dominance in one industrial sector will enable a state to exercise power over foreign companies operating in that sector, but not necessarily in others" (p. 10). Sanctions that would cause a target government minimal pain could be devastating to a firm within that country.

From this sector-specific approach, three hypotheses follow. First, extraterritorial sanctions should be more effective when the U.S. market is an important one for the sector in question. Second, when the target is dependent upon U.S. markets and suppliers, it will be more likely to acquiesce. Third, targeted firms are more likely to concede when U.S. power is derived from the ability to close off American markets, rather than the ability to disrupt supplies of inputs.

Shambaugh tests these hypotheses with a statistical analysis of 66 U.S. extraterritorial sanctions from 1949 to 1986 and two in-depth case studies: the 1982 sanctions against Western European firms involved with the construction of the Soviet natural gas pipeline, and sanctions to enforce Operation Exodus, a mid-1980s effort by the United States to restrict high-technology exports to the Soviet Union.

Shambaugh's conclusion may not sound dramatic: "Sanctions and incentives are likely to be effective when the targeted actor is dependent upon the particular resource that it is being offered or denied" (p. 10), but it should be placed in context to understand its import. Recent literature on sanctions either claims that they never work (Robert Pape, "Why Economic Sanctions Do Not Work," *International Security* 22 [1997]: 90–136) or that they only work when backed by a preponderance of military power (Clifford Morgan and Valerie Schwebach, "Fools Suffer Gladly: The Use of Economic Sanctions in International Crises," *International Studies Quarterly* 41 [1997]: 27–50) Shambaugh's point that sanctions work when they are economically costly to the target rebuts these arguments.

The author also does an excellent job of applying this

framework to the Helms-Burton and Iran-Libya cases, pointing out that the former has been more effective than commonly acknowledged, whereas the latter has been ineffective. He concludes that secondary sanctions do not create conflict because of nominal violations of sovereignty norms. Rather, "secondary sanctions tend to cause intergovernmental conflict precisely because they can provide an effective means for states to influence the activities of foreign firms and individuals operating abroad" (p. 161).

These results are useful but incomplete in several ways. One problem is the failure to consider alternative explanations. Shambaugh contrasts his social power framework with a hegemonic power explanation, but this is an odd choice. There was very little variation in U.S. power during the period under review, so it is not surprising that it would not explain much. It would have been more useful to compare the social power approach with others that stress issue linkage in a more sophisticated fashion. This is an important question, since the book implies that linkage policies are generally fruitless. For example, does sectoral trade dependence do a better job of explaining the cases than the target state's overall trade dependence on the United States? What about the presence or absence of an international institution? These possibilities are not examined systematically.

The statistical chapter is also problematic in places. The explanation of the variable codings is convoluted at times and may require two or three rereadings. The operationalization of U.S. hegemony is somewhat unusual, but there is no explanation given for it. In the regression that compares the social power framework with the hegemonic power explanation, Shambaugh claims that key variables are statistically significant, but his own significance criteria show otherwise (compare the statements on p. 61 with the table on p. 63).

The most important problem is the unexplored relationship between the firms targeted for sanctions and their host countries. One conclusion that comes through in the empirical material is that secondary sanctions are much more likely to succeed if the host country implicitly or explicitly supports the sanctions, but there is little explanation for the conditions under which states will choose to support or oppose sanctions. Curiously, Shambaugh does generate one hypothesis on this question: States are more likely to acquiesce when the sanctioning state threatens to cut off the supply of strategic goods; but there is no substantive test of this hypothesis. As a result, his claim that the social power framework can be used to explain the behavior of firms and states must be discounted.

Faking It: U.S. Hegemony in a "Post-Phallic" Era. By Cynthia Weber. Minneapolis: University of Minnesota Press, 1999. 168p. \$37.95 cloth, \$14.95 paper.

Anne Sisson Runyan, Wright State University

What happens when queer theory "takes on" U.S. foreign policy? Suddenly, the dry and all-too-familiar landscape of rational choice, power politics, military interventions, and regime building gives way to an iconoclastic phantasmagoria of castration, love-scorned melancholia, male hysteria, and cross-dressing. At the center of this passion play is the U.S. body politic, which loses "his" vital member at the hands of Castr(o's/ating) Cuba, denying "him" "straight" forward power projections and reflections in the Caribbean She/Sea. Ever since this dismemberment, which ushered in a "post-phallic" era, U.S. foreign relations in the Caribbean can be read as a series of compensatory strategies designed to "fake" phallic power. Faking it, however, means that the United

States must strap on a queer organ, which ironically "(re)covers America's international phallic power while at the same time throwing its normalized (or straight) masculine hegemonic identity into crisis" (p. 7). By revealing how U.S. identity and foreign policy in relation to the Caribbean has become queered, feminist international relations and queer theorist Cynthia Weber seeks to disrupt the denial of this masculine identity crisis in the interests of "unharnessing" phallic power and hegemony.

How does Weber support her claims about the queering of U.S. foreign policy? By rereading "in the Barthesian sense the U.S. collective 'national fantasy' about its hegemony" (p. xiv) as articulated in the words of American foreign policymakers and configured in the actions of the United States since 1959 in Cuba, the Dominican Republic, Grenada, Panama, and Haiti, Weber presents a mise en scene in which she traces the gender (re)codings of a U.S. protagonist as it tries to (re)read itself through its increasingly antagonistic "others." What emerges is a riotous cast of characters whose very names signal the sexual-scape of the U.S.-Caribbean theater. The story opens with a castrating Castro, whose hypermasculinity emerging from the feminized space of a U.S.-controlled Caribbean thwarts but does not quell the "narcissitic love" of the United States for the Caribbean She, which it needs to assure/reflect back its own masculinity. Like Balzac's Sarrasine, the United States cannot accept that the object of its desire is no longer the woman "he" thought "she" was. Even when the now ambiguous "she" in the form of Castro's Cuba becomes the "trophy mistress" of another man (the Soviet Union), which the United States tries but fails to stop, the now neutered United States, in the grips of love-lost "melancholia," embarks on a program of "rephallusization" to recover its lost member and love. (Consider the contemporary reenactment of this in the Elian Gonzalez controversy over who is the father, Cuba or the United States.)

"Seeing red" everywhere and attempting to cover up its melancholic "blues," the United States, under the "Johnson" administration, invades the Dominican Republic to "whiten out" its loss of Castro's Cuba. But in doing so it "overexposes" itself, substituting hegemony with unpopular naked power, which "stripped" it of its "status as a loved object" and revealed a more "phantom-like" phallus in the eyes of the Caribbean "Sea/See" (p. 54). In order simultaneously to reclaim/reclamate a hegemonic phallus and recalm the Caribbean Sea/She, "screen" star Ronald Reagan performs an act of prestidigitation, making the United States believe it has a real (not just a "reel" or simulated) phallus through the invasion of Grenada and turning the Caribbean Sea/Seethe into a refeminized "U.S. lake" through the Caribbean Basin Initiative. But this "remasculinization of America," which Susan Jeffords (The Remasculinization of America: Gender and the Vietnam War, 1989) also tracks in her analysis of Vietnam cinema as it shifts from guilt-ridden characters in the 1970s to Rambo in the 1980s, did not last, for its fiction wore thin as Reagan himself became frayed around the edges in the face of the Iran-Contra scandal.

Bush (whose very name and signature slogan—"Read my lips!"—are evocative of female genitalia) is unable to sustain even a simulated erection, so he and his also similarly hapless counterpart, Noriega, who was a man without a "canal" to prove his own masculinity, are thrown into "male hysteria," which is signaled by an "excessive miming of masculinity" to cover up for "what's missing" (p. 98). But the U.S. invasion of Panama and subsequent arrest of Noriega are not achieved by masculine international power projection but by feminine tactics of "encirclement" and "entrapment" that are played

out in domesticated space. This is the defining or definitively "queering" moment of the "New World [Post-Phallic] Order," which sets the stage for the United States in drag playing "Who's got the phallus?" in Clinton's "intervasion" of Haiti. Just as Clinton disavowed having sex with Monica Lewinsky by claiming he only used a fake phallus (a.k.a. the cigar), he also embraced the strategy of "male masquerade" (or cross-dressing to appear not to have a phallus but also to keep "others" guessing as to whether there is a phallus under that dress) vis-à-vis Haiti by dressing up U.S. action there under the mantle of the United Nations and deploying a good cop-bad cop team of negotiators (Carter, Powell, and Nunn), who together added up to an indeterminately gendered (or "transvestite") U.S. presence.

Through this rewritten script of international relations as intersexual relations, the reader begins to see the "altered state" of the United States as Weber does: "A white headless body of indecipherable sex and gender cloaked in a flag and daggered with a queer dildo harnessed to its midsection" (p. 1). Captain America gives way to Austin Powers, International Man of Mystery, not only in this scholarly reimagining but also in the national/popular imaginary. Indeed, just as this heady and hilarious mixture of poststructuralist, psychoanalytic, queer, feminist, and critical analysis must be read against and in between the lines of the traditional stiff stuff of international relations as an act of counterhegemony and disarmament, it also is illuminating to read it with the latest exploits of Austin Powers in mind, who loses his "mojo" in the 1960s, ineffectually tries to recover it, and then decides he does not need it to fake it. Of course, the audience knows that the comical, mixed gender figure of Austin Powers is only kidding himself and, in fact, never really "had" "it" at all, despite and because of all his posturing. But this is also what Weber invites her audience to know about the United States: Its dominant stories about itself are but artificial props (or "queer accessories") that (self-)deceptively prop up its hegemonic power. Whatever your response to this highly provocative, revelatory, and unforgettable take on "everything you wanted to know about U.S. foreign relations, but were afraid to ask," one thing is for sure—the United States and his/her/ its relations will never look the same to you again.

Media and Political Conflict: News from the Middle East. By Gadi Wolfsfeld. New York: Cambridge University Press, 1997. 386p. \$19.95 paper.

Robert M. Entman, North Carolina State University

This important book explores the influence of the news media in the frequent instances when political conflicts occur between unequal sides, such as a large state acting against a smaller one, or a government against a protest group. The defining characteristic of these circumstances is that one side has far weaker coercive resources than the other—or none at all. Wolfsfeld terms the side with the preponderance of resources "authorities," and they confront "challengers." He advances a "political contest model" to describe and explain the ways media shape and are shaped by struggles for control over outcomes. Although the model is applicable to international conflicts, the book concentrates on domestic conflict between protest groups and government authorities. Wolfsfeld seeks to explain how antagonists and the media influence one another and, in particular, when the media are most likely to play an independent role in political conflicts. Adding a much needed non-U.S. focus to literature in this area, after elaborating his model, Wolfsfeld offers several illustrative case studies based on political conflicts in Israel.

Wolfsfeld argues that the political process is more likely to influence the media than vice versa: The media usually react rather than initiate or control events. But this is not a brief for the minimal consequences of the media. In many circumstances, the media's decisions do help set the public agenda, magnify political success and failure, serve as independent channels for challengers, mobilize new participants into a conflict, and affect the understandings of events held by elites and ordinary citizens alike. The degree to which the media exert some independent influence heavily depends on the degree of control over newsworthy political events that authorities can exert. When the authorities can thoroughly control the flow of information and the behavior and talk of elites, their perspective will structure the media's framing of events. News may then become little more than government propaganda. But when authorities' control is shaky, the media obtain more potential sources and perspectives from which to choose, opening space for more independent coverage that can further undermine authorities' control. This means that the media's influence over the outcome of conflicts varies over time and circumstance, depending on such factors as the political resources, skills, and power of antagonists; the perceived state of public opinion; the ability of journalists to gain access to events; and the nature of events themselves. Any simple, general conclusion about the media's role and power therefore is likely to mislead.

In a few well-written chapters, Wolfsfeld lays out the important variables in the media-government relationship with precision and insight, making distinctions that are often omitted or poorly specified in the literature. For example, while he acknowledges the enormous structural advantages exercised by governing elites in the contest to shape media coverage and public perspectives on events, he identifies the forces that can counterbalance government's sway. In his formulation, the ability of challengers to influence the media depends on each side's value to the media, divided by its dependence on the media. Value is determined by such matters as a participant's political and social status, degree of organization and resources, willingness to engage in exceptional (and thus newsworthy) behavior, and ability to exert some control over political events. Dependence is determined by a group's access to government power and its need for external support. Authorities do not automatically have more power over the media than challengers. For instance, lower ranking officials often have less value to reporters seeking good copy than leaders of powerful interest groups, and presidents perceived as unpopular and ineffective may be more dependent on media favor and less valuable to journalists than a charismatic senator or even a group leader. As the examples suggest, Wolfsfeld's model can help us understand not only conflicts between authorities and outside challenges but also the frequent circumstances in which there is no unified "government" version of events, when elites themselves conflict. In such conditions, the media may contribute to determining who actually governs.

The heart of the book consists of a series of case studies of political contests: protests in Israel for and against the Oslo peace accords, competition over the Israeli government's responses to the Intifada protests by Palestinians (a major goal of both sides was influencing the U.S. media, not just Israeli), and conflict over the Gulf War. Each study provides a sensitive account of media-government interactions that illustrates the theoretical model. One distinguishing characteristic of the cases is that, again atypically for many media studies, they are based not only on content analysis but also on Wolfsfeld's interviews with participants in the conflicts. He managed to obtain candid discussions of media strategies

and calculations from government officials, protest group leaders (Israeli and Palestinian), and journalists. For instance, in analyzing the Intifada, Wolfsfeld concludes that media did not cause but did affect the course of that movement. The Intifada illustrated a protest group overcoming the government's normal ability to control both newsworthy events and information flow. The media coverage enlarged the scope of the conflict, bringing in potential allies to the Palestinian side, and boosted the international visibility and thus morale of the Palestinians. The willingness of Palestinians to expose themselves to physical danger day after day, combined with the presence of international media to record newsworthy images of the physical conflicts, and with substantial disagreement about the situation among Israeli and U.S. elites, heavily constrained the options of the Israeli government.

Although the case studies provide many valid insights, one can sometimes quibble about Wolfsfeld's application of his own model. For example, in making his point about the importance to media images and public perceptions of exerting or losing control over events, Wolfsfeld argues that "all of the public relations experts in the world could not correct the damage in the news media that followed the explosion of the car bomb that killed over 200 Marines" in Lebanon in 1983 (p. 25). In fact, the Reagan administration's public relations experts, by using their other resources (such as control over information) and in the absence of active elite opposition, turned even this disastrous, unexpected event into a relatively benign media narrative. That reading is supported by the fact that approval of Reagan's poorly rationalized Lebanon policy rose by 15 percentage points, to 65%, after the tragedy. But it is certainly true that—as illustrated by the Intifada circumstances often arise in which the public relations machine fails to convert the media to cooperative mouthpieces for government.

Wolfsfeld modestly claims his book may lack generalizability because of its focus on the small and perhaps unique state of Israel. Yet, the model he offers seems broadly applicable. More clearly than any previous study, this volume identifies the important variables that structure relationships among government, the media, and challenging groups, and it provides a plausible and testable account of how some of the key questions that occupy political communication scholars may be answered. The book merits wide and careful attention among scholars of political communication and political participation.

Security, Strategy, and Critical Theory. By Richard Wyn Jones. Boulder, CO: Lynne Rienner, 1999. 196p. \$49.95.

David A. Welch, University of Toronto

The Victorian travelog is a fascinating literary genre. Generally written in exquisite prose, the typical work presents itself as an authoritative exploration of a foreign land and its people. But despite a handful of brilliant insights, it all-too-obviously betrays an interloper's eye and a stranger's intimacy, painting a distorted picture of the whole. The composition is too hasty; the brush is too broad; the palette is too limited; and the artist, lacking sympathy with the subject, caricatures and cartoons. The writer also cannot resist—with imperial condescension—comparisons with Britain. A smattering of positive ones, on minor points, is de rigeur, but on major points the gist is always the same: "These people ought to be more like us." Yet, the comparisons unwittingly yield fascinating insights into Victorian Britain itself. In short, the

travelog—ostensibly a lens—is unfailingly a much better mirror.

Richard Wyn Jones has written the equivalent of a Victoian travelog. He is a critical theorist traveling in the land of "traditional" security studies. But he improves on the original genre, for his self-examination is explicit. His book is designed both as lens and as mirror. The mirror is superb. The lens is problematic.

Part I, "Traditional and Critical Theory," is an efficient and penetrating orientation to the Frankfurt School and the evolution of critical theory from Horkheimer and Adorno to Habermas, Honneth, Beck, and Feenberg. It stresses three issues central to the study of security: the social role of theory, technology, and emancipation. Wyn Jones makes no secret of his sympathy for Horkheimer's original project, but he is sharply critical of its historical trajectory. The discussion is subtle, sophisticated, hard-nosed, yet respectful. The prose is graceful and accessible to boot. I know of no better entrée to the subject.

Wyn Jones defines critical theory in opposition to "traditional" theory, which, in his view, posits a radical separation of subject and object, maintains a rigid fact-value distinction, and embraces a "scientific objectivist" epistemology. Critical theory, in contrast, insists that subjects and objects are mutually implicating; embraces dialectical materialism; denies the possibility of value-free or value-neutral knowledge; and self-consciously seeks to promote the goal of human emancipation through the device of immanent critique, revealing the transformative possibilities inherent in the status quo. It is on this last point that Wyn Jones is most critical of theorists such as Horkheimer, Adorno, and Habermas; they, for one reason or another, have abandoned immanent critique and have lost their normative zeal. Wyn Jones favors reenergizing critical theory along Gramscian lines.

reenergizing critical theory along Gramscian lines.

Part II, "Traditional and Critical Security Studies," is primarily an assault on neorealist theorists and Cold War nuclear hawks. Wyn Jones criticizes them for fetishizing and anthropomorphizing the state, for having an overly narrow and traditionally military understanding of security, for ignoring the ethical implications of their work, and for having an "erroneous, undialectical, and ahistorical understanding of technology and particularly the interaction of military technology and strategic culture" (p. 166). They speak exclusively to elites, legitimize the status quo, and silence alternative approaches. Wyn Jones does not bother to hide his antipathy here, and the discussion is unsubtle, unsophisticated, and disrespectful. The prose is still graceful and accessible, but as an entrée to "traditional" security studies, it is deeply flawed.

What explains the stunning difference between parts I and II? Part of the answer, surely, is asymmetrical familiarity. Wyn Jones knows his critical theory, but his reading of "traditional" security studies is extremely narrow, and the number of people whose work fits his description is very small indeed. He offers several cogent and powerful critiques of this corpus, but they are not particularly new. The most devastating demonstrate that, on its own terms, neorealism does not perform particularly well, but this is precisely why so few security specialists concern themselves with it today. The vast majority of scholars who understand themselves to be studying "security" in a "scientific" way avoid anthropomorphizing the state, are keenly sensitive to questions of organizational and strategic culture, appreciate the importance of belief-systems, have a sophisticated understanding of military technology, and, increasingly, concern themselves with a much broader range of issues than just interstate military conflict.

In his exhortation to broaden and deepen the security agenda, Wyn Jones has somehow completely overlooked an enormously rich and diverse community of scholars who have done just that. There is no room in his taxonomy for Graham Allison, Steve Chan, Dan Deudney, William Dixon, Barbara Farnham, Peter Feaver, Ted Robert Gurr, Ole Holsti, Thomas Homer-Dixon, Robert Jervis, Charles Kupchan, Deborah Welch Larson, Richard Ned Lebow, Jeffrey Legro, Jack Levy, Joseph Nye, John Owen, Barry Posen, R.J. Rummel, Scott Sagan, Jack Snyder, Janice Gross Stein, Stephen Van Evera, and John Vasquez (to name a few). Compounding the lack of familiarity is a certain amount of confusion. For example, when Bruce Blair's very traditional analysis leads to the conclusion that strategic and political culture can affect force-structure decisions (The Logic of Accidental Nuclear War, 1993), Wyn Jones fails to notice that traditional theory can handle cultural variables, too. Instead, he interprets Blair's treatment of technology as "critical" (pp. 140-1).

To some extent, Wyn Jones is handicapped by the Frankfurt School's fundamental misunderstanding of the scientific project. It is debatable whether anyone since Bacon held to a "radical" distinction between subject and object and the simple correspondence theory of truth that goes with it, but if so, these had certainly disappeared by the early 1930s with the work of Erwin Schrödinger, Werner Heisenberg, Kurt Godel, and Niels Bohr. Far from "undermining" the naturalscience model (p. 101), developments such as these took it to a much higher level. Likewise, critical theorists misunderstand the supposed "value-neutrality" of modern science. Scientists are generally motivated by a desire to make the world a better place; are rarely indifferent to the uses others make of their discoveries; and appreciate that, in certain circumstances, their values and beliefs can affect their interpretation of ambiguous experimental results. Most scientists are also aware that values, beliefs, and "power" shape research agendas and resource allocations (an insight critical theory and poststructuralism have helped draw to their attention). But they insist that we can know at least some important things about the world regardless (e.g., the value of Planck's Constant or the speed of light).

The crucial point is that a researcher's interaction with the object of study, and the values he brings to it, represent nothing more than sources of uncertainty and error whose seriousness varies with context. Ceteris paribus, these are more a problem for social than for natural scientists. Within natural science, observational effects are more a problem at microscopic than macroscopic scales. We can never eliminate these errors entirely. But they do not imply either (1) that all knowledge is socially constructed or (2) that one set of statements about the world is as defensible as another. We cope tolerably well with these sources of error by adhering to methodological norms that make them easier to spot. Foremost among these is the publicity and transparency of evidence and inference.

Ironically, it is precisely these norms that provide Wyn Jones with his best critical tools. Relatively little of his critique—either of critical or "traditional" theory—is dialectical or immanent. He has a sharp eye for faulty inference; he is concerned when he sees a lack of "fit" between theory and evidence; he prefers claims that are "closer to the truth" (p. 45) and "more attuned to social reality" (p. 156); and he seeks a "superior understanding of security" with "a broader utility" (p. 1). These are all criteria quite congenial to "traditional" theory properly conceived.

And herein lies the transformative potential immanent in Wyn Jones's work. But to realize that potential, he will have to rethink a central pillar of critical theory as he has defined it: Its willingness to make moral judgment a truth-criterion. This is a mistake for three reasons. First, as we learned from the devastation Lysenko wrought on Soviet biology, one cannot necessarily wish the world into working one way rather than another. Second, if one truly seeks to persuade others, it rarely pays to cast your difference as a Manichean struggle, accusing them of an "atrophy of reason: a pathology, a moral blindness, the type of thinking that was exhibited in the mechanized slaughter at Auschwitz" (p. 130). Third, and finally, moral visions themselves cry out for justification. Few would disavow "human emancipation" as an abstract goal, but there is ample room for legitimate debate about what that ought to mean concretely, and how best to achieve it.

The Effectiveness of International Environmental Regimes: Causal Connections and Behavioral Mechanisms. Edited by Oran R. Young. Cambridge, MA: MIT Press, 1999. 326p. \$55.00 cloth, \$25.00 paper.

Christopher C. Joyner, Georgetown University

International environmental regimes are political institutions, but do they really matter in interstate relations? If so, to whom, in what ways, and why? Moreover, what factors and circumstances determine their effectiveness? The product of a multiyear project directed by Oran Young, the regimemeister at Dartmouth College, this volume systematically addresses these queries. The twelve authors critically assess three international regimes concerning marine pollution, a shared fishery, and transnational acid rain deposition. Their aim is to determine whether and to what extent these arrangements actually affect the behavior of participant states. Both in terms of theoretical design and policy analysis, the authors succeed commendably.

"Effectiveness" is a tricky, multidimensional concept, but this project treats it with considerable balance and sophistication. The authors examine how and to what extent "effectiveness" is produced by each regime. Each case study adheres to a template designed to describe the problem, the stakeholders and their interests, and the main attributes of the regime. The critical focus, however, properly falls on the operation of the regime and the degree to which it affects the behavior of participants. Although effectiveness is not measured through quantitative calculations, the authors' assessments are, on balance, analytically rigorous and empirically impressive.

Oran Young and Marc Levy introduce the volume by cogently setting out the definitional parameters of effectiveness and explaining the standardized method used by each research team. Readers will gain much from this essay in its own right, as it thoughtfully elaborates on the multifunctional character of regimes, especially those pertaining to transnational environmental concerns.

In the first case study, Ronald Mitchell, Moira McConnell, Alexei Roginko, and Ann Barrett examine whether improvements in the rules regulating marine pollution reflect the actual influence of the MARPOL 73/78 Convention (the international regime for regulating discharges of oil by tankers), or are more the result of changes in the interests of the most powerful actors. As their findings reveal, the key to the regime's success lies in its regulation of an equipment subregime, which made operation of the vessels cleaner and less pollution-causing, thus contributing to the effectiveness of the regime overall.

The second case study, authored by Olav Stokke, Lee

Anderson, and Natalia Mirovitskaya, concerns fisheries management in the Barents Sea and is distinctive for being the sole conservation regime in this volume. Bilateral agreements between Norway and Russia comprise the regime, although serious questions of jurisdiction persist over who may fish where, when, and for how much to ensure that the balance of neither any particular species nor the regional marine ecosystem as a whole is disturbed. As the authors rightly conclude, even the best decisions by a fisheries regime can be undercut by scientific uncertainty about how much stock is present now, as set against the need to harvest how much stock tomorrow.

The third case study, by Don Munton, Marvin Soroos, Elena Nikitina, and Marc Levy, looks at acid rain control. Specifically, the authors evaluate the regimes created for Europe in the 1979 Convention on Long-Range Transboundary Air Pollution (LRTAP) and for North America in the 1980 Canadian-U.S. Memorandum of Intent (and codified in the 1991 Canada-United States Air Quality Agreement). The aim is to determine whether these agreements reduced acid rain deposition and, if so, how these effects were transmitted by governments into policy changes. This study well illustrates the conflictive interaction among governments, industry, labor, and environmentalists, who are the key actors involved in most struggles over domestic regulation.

It is curious that none of the studies discusses the contributions to regime effectiveness made by "soft" law (i.e., the misnomer referring to nonbinding legal norms). In the case of marine pollution such soft law surely is relevant, especially in the multiplicity of codes adopted by the International Maritime Organization for facilitating regulation of shipping, navigation, and safety standards of vessels sailing the high seas. Likewise, in the case of the Barents Sea, consideration of the FAO's Code of Conduct for Fisheries would seem prudent for governments to impose on their nationals who fish there. It also would have been useful to have maps illustrating the scope and nature of these environmental regimes. For example, a map showing the jurisdictional implications of allocating regional fisheries, in particular the disputed region between Norway and Russia and the loophole area among these two states and Iceland, would have been especially appreciated, as would another depicting the transnational scope of the LRTAP acid rain regime for Europe and North America.

These quibbles notwithstanding, certain "truths" emerge from this compendium of analyses. First, regulatory environmental regimes do matter. They alter government attitudes, shift national priorities, change legal perceptions, and produce new norms that affect policy preferences. Second, multilateral regulatory regimes are not panaceas for critical environmental problems affecting a region. At a minimum, genuine cooperation among governments is essential for regime effectiveness. Why? Environmental problems are complex—politically, economically, socially, scientifically, and legally. They defy easy solution by any state or group of states. Multiple domestic and international actors, with conflicting interests and values, make solutions even more difficult. Furthermore, regimes can shape expectations about anticipated outcomes. This finding unmistakably surfaces from the three cases analyzed.

The cases provide compelling evidence that regimes can be effective, as they facilitate and enhance intergovernmental cooperation on environmental collective-action problems. They demonstrate that regimes foster social norms rooted in considerations of legitimacy and authoritativeness, which help guide the behavior of individuals and governments alike. That is true

for international oil shippers, fishers in the Barents Sea, or industrialists in Europe and North America. In addition, regimes contribute to social learning, not only in defining norms for behavior but also in fostering the need to know more about geophysical processes that contribute to the problem, in order to arrive at appropriate solutions that might be taken by the regime, a point underscored by the long road to transnational acid rain control. Similarly, regimes can function to shape the identities of actors and thus influence how they behave in bargaining to obtain benefits and assign roles among participants in the regime. The bottom line is this: International environmental regimes can and do influence the behavior of their member states. They serve to define roles and bestow authority for regulating international conduct. And they enhance interstate cooperation and facilitate learning about serious transnational problems.

The cases analyzed make it evident that environmental regimes do make a difference. They exert a certain influence on the social behavior of actors and institutions, and they can maximize interests and opportunities of actors. States tend to bear the institutional costs imposed by a regime so long as the benefits and rules of the regime serve and enhance the state's individual interests. Regimes also enable participants to attain these interests through shared norms and reciprocal expectations. These are important findings, worthy of serious reflection. It is not surprising, then, that a careful perusal of the conceptual approach and substantive case analyses contained in this volume will yield high intellectual payoffs, not only for experts interested in international relations and regime theory but also for scholars of international law and international institutions.

RACE IN AMERICA

Analytical and Policy
Perspectives in the 21st Century
November 2–3, 2000

University of Nebraska-Lincoln

2-3, 2000

ebraska Lincoln

Deadline (postmark) for submissions: July 1, 2000

We ask that paper proposals be submitted to the following address:

Michael W. Combs Department of Political Science 535 Oldfather Hall University of Nebraska--Lincoln Lincoln, NE 68588-0328

HEND2000@nnLedu

The major thrust of the conference is to enrich and contribute to the analytical and policy debate on race in America in the twenty-first century. With this objective in view, the conference welcomes research that focuses on the following areas: Business and Economics, Education and Health Policy; Historical analysis; Politics and Public Policy; Law, Courts and the Justice System.

The conference solicits papers that view race in historical and contemporary contexts; that are innovative in their methodology, analysis, and conclusions; that analyze the complexity and viability of the discourse on race in the twenty-first century, and that discuss proposals that might guide our conceptualization and approach to race in the twenty-first century.

The proposals should be no more than a page, single spaced. The deadline for paper proposals is July 1, 2000. Once the paper proposals have been selected, three copies of the paper are to be sent to the organizer on or before October 1, 2000. The organizer of the symposium reserves first rights to publications of all papers presented at the conference on race.

CALL FOR PAPERS

Politics in Life

Politics in Life

THE LANGUAGE WAR Robin Tolmach Lakoff

"In a series of provocative, dazzlingly argued essays, Lakoff charts how the media's use of language shapes both public attitudes and social policies on current events.... Witty and illuminating, Lakoff's analysis is an important addition to both linguistic and political studies."

—Publishers Weekly starred review \$24.95 doth

In Paperback

DISPOSABLE PEOPLE

New Slavery in the Global Economy Kevin Bales

"A well-researched, scholarly and deeply disturbing expose of modernday slavery with well-thought-out strategies for what to do to combat this scourge. None of us is allowed the luxury of imagined impotence. We can do something about it."

-Desmond Tutu

\$14.95 paper

TOBACCO WAR

Inside the California Battles

Stanton A. Glantz and Edith D. Balbach

"The man who 'belled the car' in the 1980s with his annual accounting of tobacco-industry campaign contributions has produced a definitive case study of how special interests manipulate and distort the political process. It should be required reading for all state politicians, if for no other reason than to remind them that there is someone out there watching what they do."

> -Steve Scott, political editor, California Journal

\$50.00 cloth \$19.95 paper

MAKING PEACE

George Mitchell

In Paperback With a New Preface

"[Making Peace] conveys the tension, drama, and high-wire diplomacy that almost doomed the peace process.... Mitchell's humanity shines through."

-Kevin Cullen, Boston Globe

\$16.95 paper

ABORTION AND THE POLITICS OF MOTHERHOOD Kristin Luker

In Paperback With a New Preface

"A lucid, fair-minded and, most importantly, convincing analysis of the contemporary debate about abortion."

> -Paul Robinson, New York Times Book Review

Cooley Award; California Series on Social Choice and Political Economy \$17.95 paper

SPACES OF HOPE David Harvey

There is no question that David Harvey's work has been one of the most important, influential, and imaginative contributions to the development of human geography since the Second World War... His readings of Marx are arresting and original—a remarkably fresh return to the foundational texts of historical materialism."

> -Derek Gregory, author of Geographical Imaginations

Editor's Notes

Authors sometimes refer to additional information that is not included in the printed version of their APSR article but is "available from author." Interested readers have always been expected to contact authors directly to obtain this material. To ensure that material announced in the APSR as "available from author" is readily accessible, beginning with volume 90 (1996) we have required that copies of this information be submitted to the APSR office before articles are sent to press, and these are retained in the editorial office.

To facilitate provision of this supplementary material, we have also posted the information or files containing the information at the *APSR* web site and provided a hyperlink to the information at the conclusion of an article's abstract. Abstracts are linked to the table of contents for each issue.

For example, the route to one file of additional materials provided for the current issue would be:

URL for APSR home page:	http://www.ssc.msu.edu/ ~apsr/
Then, click this link	to be taken to this URL
Recent and Current Issues	http://www.ssc.msu.edu/ ~apsr/vols.html
Volume 94, 2000	http://www.ssc.msu.edu/ ~apsr/vol94.html
September 2000	http://www.ssc.msu.edu/ ~apsr/toc900.html
ABSTRACTS	http://www.ssc.msu.edu/ ~apsr/abs900.html

From the abstract page, click any link to "supplemental information," e.g., at the end of the abstract for Daniel Diermeier and Randolph T. Stevenson. 2000. "Cabinet Terminations and Critical Events." *American Political Science Review* 94 (September): 627–40. When the link supplemental information is clicked, a download of the file diermeier zip will begin.

In other cases, the supplemental information link will take you to a web page on which the data provided by the author is posted in text format. You may view, print, or download this information as desired.

Additional materials may have been requested by reviewers or required by the Editor as part of their evaluations of manuscripts, and the materials have seemed sufficiently important to be made available to other readers by this method. Alternatively, authors may simply wish to make additional materials available to readers, e.g., to justify their use of particular statistical techniques, make replication data sets available, or for other purposes. Therefore, the materials have received differing amounts of peer review. In general, readers should *not* assume that materials posted have gone through the normal APSR peer review process.

If readers encounter any difficulties with the APSR web site, or in reading any of these supplementary

materials or files, please let us know by email to apsr@ssc.msu.edu. Substantive issues should be taken up with authors.

For APSR articles published since 1996 where materials are announced as "available from author" but are not linked to the author's abstract at the APSR web site (there are very few, if any, such cases), readers should contact the authors for copies. If authors do not respond or material is not made available, readers may contact the editorial office for assistance. It should also be stressed that no supplementary material is available at the APSR web site or from the editorial office unless it has been announced as "available from author" in the printed version of the article. Of course, this should not discourage interested readers from contacting authors directly if they have follow-up inquiries about their research.

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The American Political Science Review strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the Review reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Since the Review publishes original research, authors should not submit articles containing tables, figures, or substantial amounts of text already published or forthcoming in other places, or that are included in other manuscripts submitted for review, whether to book publishers or periodicals (including online journals), or are otherwise committed. In many such cases, subsequent publication of this material would violate the copyright of the other publisher. The APSR also does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. If there is any doubt about whether these policies would apply to a particular case, the author should discuss any such publications related to a submission in a cover letter to the Editor. The Editor should also be notified of any related submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the APSR and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; authors are encouraged to calculate response rates according to one of the standard formulas given in The American Association for Public Opinion Research, Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for RDD Telephone Surveys and In-Person Househould Surveys (Ann Arbor, MI: AAPOR, 1998). This document is available on the Internet at http://www.aapor.org/ ethics/stddef.html>. For experiments, provide full descriptions of experimental protocols, methods of subject recruitment and selection, information about any payments and debriefing procedures, and other relevant details. It is desirable for articles to be selfcontained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The APSR uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of

critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, American Political Science Review, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the APSR does not process new manuscripts during August; new manuscripts should be mailed to arrive either before or after. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 61/2 inches, as is typical for manuscripts (rather than the double-column format of the published version of the Review), and printed on one side of the page only. Include an abstract of no more than 150 words. The American Political Science Review style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

For specific formatting style of citations and references, please refer to any articles in the most recent issue of the *Review*. For unusual style or formatting

issues, authors may consult *The Chicago Manual of Style*, 14th edition. For review purposes, we do not require that citations and references be in specific *APSR* format, although some generally accepted format should be used, and all citation and reference information should be provided.

Specific Procedures

Please follow these specific procedures for submission:

- 1. Submit five copies of manuscripts. Please review all pages of all copies to make sure all copies contain all tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
- 2. To comply with the *Review's* policy of double-blind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
- 3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, full citations should be included as usual in the bibliography. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgements must appear on the title page of the identified copy only. Manuscripts that are not judged anonymous will not be reviewed.
- 4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, email) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.
- Please also send a loose copy of the cover page of the identified copy.
- 6. Authors having access to e-mail should send a

copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word Abstract followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.

7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail.

No copies of submitted manuscripts can be returned. Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the *Review* or at our Internet web site, http://www.ssc.msu.edu/~apsr/.

ELECTRONIC ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Full text of the American Political Science Review is available in several electronic formats and through several different venders.

Except for the last three years (as an annually "moving wall"), back issues of the American Political Science Review beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (http://www.jstor.org/). Issues through Volume 90, Number 4 (December 1996) are currently available. At present, while JSTOR's complete collection is available only via institutional subscription, individual subscriptions to the APSR part of JSTOR are now available to APSA members. Please contact Member Services at APSA for further information.

Full text access to current issues of both the APSR and PS is also available online by library subscription from a number of database vendors. Currently, these include University Microfilms Inc. (UMI) (via its CD-ROMs General Periodicals Online and Social Science Index, and the online database ProQuest Direct), Online Computer Library Center (OCLC) (through its online database First Search as well as on CD-ROMs and magnetic tape), and the Information Access Company (IAC) (through its products Expanded Academic Index, InfoTrac, and several online services [see below]). Others may be added from time to time.

APSR is also available on databases available through six online services: Datastar (Datastar), Business Library (Dow Jones), Cognito (IAC), Encarta Online Library (IAC), IAC Business (Dialog), and Newsearch (Dialog).

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact APSA, your reference librarian, or the database vendor, as appropriate, for further information about availability.

BOOK REVIEWS

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach,

American Political Science Review Book Review, Department of Political Science, University of California, · Riverside, Riverside, CA 92521-0118. E-mail: apsrbook@ wizard.ucr.edu. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

Information, including news and notes, for PS Dr. Robert J-P. Hauck, Editor, PS E-mail: rhauck@apsanet.org

Circulation and subscription correspondence (domestic claims for nonreceipt of issues must be made within four months of the month of publication; overseas claims, eight months)

EXEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE AND OTHER PURPOSES

Class Use

The Comprehensive Publisher Photocopy Agreement between APSA and the Copyright Clearance Center (CCC) permits bookstores and copy centers to receive expedited clearance to copy articles from the APSR and PS in compliance with the Association's policies and applicable fees. The general fee for articles is 75 cents per copy. However, current Association policy levies no fee for the first ten copies of a printed article, whether in course packs or on reserve. Smaller classes that rely heavily on articles (i.e., upper level undergraduate and graduate classes) can take advantage of this provision, and faculty ordering ten or fewer course packs should bring it to the attention of course pack providers. APSA policy also permits free use of electronic library reserve with no limit on the number of students who can access the electronic reserve. Both large and small classes that rely on these articles can take advantage of this provision. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (978)750-8400, and fax (978)750-4474. This agreement pertains only to the reproduction and distribution of APSA materials as hard copies (e.g., photocopies, microfilm, and microfiche).

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions.

APSA also has a separate agreement pertaining to CCC's Academic E-Reserve Service. This agreement allows electronic access for students and instructors of a designated class at a designated institution for a specified article or set of articles in electronic format. Access is by password for the duration of a class.

Please contact your librarian, CCC, or the APSA Reprints Department for further information.

APSR Authors

Authors of APSR articles may use their own articles in course packs or other printed materials without payment of royalty fees and may post their articles at personal or institutional web sites as long as the APSA copyright notice is included.

Other Uses of APSA-Copyrighted Materials

For any further copyright issues, please contact the APSA Reprints Department.

INDEXING

Articles appearing in the Review before June 1953 were indexed in The Reader's Guide to Periodical Literature. Current issues are indexed in ABC Pol Sci; America, History and Life 1954-; Book Review Index; Current Contents: Social and Behavioral Sciences; EconLit; Energy Information Abstracts; Environmental Abstracts; Historical Abstracts; Index of Economic Articles; Information Service Bulletin; International Index; International Political Science Abstracts; The Journal of Economic Literature; Periodical Abstracts; Public Affairs; Recently Published Articles; Reference Sources; Social Sciences and Humanities Index; Social Sciences Index; Social Work Research and Abstracts; and Writings on American History. Some of these sources may be available in electronic form through local public or educational libraries. Microfilm of the Review, beginning with Volume 1, and the index of the Review through 1969 are available through University Microfilms Inc., 300 North Zeeb Road, Ann Arbor, MI 48106 (www.umi. com). The Cumulative Index to the American Political Science Review, Volumes 63 to 89: 1969-95 is available through the American Political Science Association.

A Nation of Organizers: The Institutional Origins of Civic Voluntarism in the United States

THEDA SKOCPOL, MARSHALL GANZ, and ZIAD MUNSON Harvard University

disconnected from government. Using newly collected data to develop a theoretically framed account, we show that membership associations emerged early in U.S. history and converged toward the institutional form of the representatively governed federation. This form enabled leaders and members to spread interconnected groups across an expanding nation. At the height of local proliferation, most voluntary groups were part of regional or national federations that mirrored the structure of U.S. government. Institutionalist theories suggest reasons for this parallelism, which belies the rigid dichotomy between state and civil society that informs much current discussion of civic engagement in the United States and elsewhere.

ublic life in the United States has long been Prooted in voluntary membership groups as well as competitive elections. From churches and unions to social groups and reform crusades, membership associations have provided paths into active citizenship, allowing Americans to build community, pursue shared goals, and influence social and political affairs. Americans excel at the "knowledge of how to combine" that is the "mother of all other forms of knowledge" in a democracy, marveled Alexis de Tocqueville ([1835-40] 1969, 516-7) in the 1830s. By the 1890s, British visitor James Bryce (1895, 278) observed that "associations are created, extended, and worked in the United States more ... effectively than in any other country." Recently, social scientists have used cross-national survey data to document the extraordinary proclivity of Americans to participate in voluntary groups (Almond and Verba 1963; Curtis, Grabb, and Baer 1992; Ladd 1999, 131-6).

Despite longstanding agreement that voluntarism is central to American democracy—and notwithstanding its frequent invocation in theoretical and policy pronouncements—surprisingly little is known about the development of voluntary membership associations in the United States. Students of American political development might have tackled this issue but until now

have focused on class formation, political parties, and public policymaking. In debates now raging about America's civic health, everyone refers to traditions of voluntarism, but assumptions prevail in the absence of systematic evidence.

THE CURRENT WISDOM: SMALL WAS BEAUTIFUL IN AMERICAN CIVIC LIFE

Classic American voluntary membership groups are widely presumed to have been spontaneous and particular creations, fashioned within relatively bounded local communities; neighbors and friends coalesced outside politics and apart from involvements with extralocal government. Pundits and normative theorists regularly espouse this vision of America's civic past. Peter Drucker (1993, 9) contrasts America's tradition of "voluntary group action from below" to "the collectivism of organized governmental action from above," and George Will (1995) portrays voluntary groups as neighborly "little battalions" doing battle with "the federal government's big battalions." "Before the modern age," write conservative political theorists Michael Joyce and William Schambra (1996, 11-2) in a crisp formulation of conventional wisdom, "American life ... was characterized by both its selfcontainment and its cohesiveness. Individuals were closely bound to one another by strong families, tightly knit neighborhoods, and active voluntary and fraternal groups. Through these small, local, 'human-scale' associations, Americans not only achieved a sense of belonging and connectedness but also tackled the full range of social and human problems that today have largely become the province of government." Liberal theorists rarely disparage government, yet communitarians (e.g., Sandel 1996) suggest that national interventions have compromised local civic virtue. As Beem (1999, 197) shows in a wide-ranging review of current scholarship, theorists of all stripes focus on local communities and consider "governmental actions and ...large political organizations ... at best irrelevant to, and, at worst, inimical" to democratic civil society. Among empirical scholars, similar presumptions

Theda Skocpol (ts@wjh.harvard.edu) is Victor S. Thomas Professor of Government and Sociology; Marshall Ganz is Lecturer in Public Policy, Kennedy School of Government, and Ziad Munson is a PhD candidate, Department of Sociology, Harvard University, Cambridge, MA 02138.

Financial support for this research was provided by the Ford Foundation, the Russell Sage Foundation, the Pew Charitable Trusts, the John D. and Catherine T. MacArthur Foundation, and the Whitehead Center for International Affairs at Harvard University. We are especially grateful for data collection efforts by Bayliss Camp, Andrew Karch, Cameron Sheldon, David Siu, and Jennifer Over; we also thank other researchers for the Civic Engagement Project. Librarians and archivists in various cities and associations helped us assemble data. For helpful comments on earlier versions, we thank the APSR Editor and anonymous reviewers as well as Robert Bates, Sheri Berman, Irene Bloemraad, David Collier, Jorge Dominguer, Morris Fiorina, Gerald Gamm, Peter Hall, Ronald Heifetz, Jason Kaufman, Margaret Levi, Lisa Martin, Ted Miguel, Debra Minkoff, Mark Moore, John Padgett, Andrew Polaky, Robert Putnam, Kenneth Shepele, Bill Skocpol, and Sidney Verba.

span disciplines. Historians portray U.S. voluntary groups as local, informal, and profusely varied-until industrial modernization brought standardization and bureaucracy. Versions vary (cf. Wiebe 1967 and Ryan 1997), but the main story line features the eclipse of once vital particular communities by nationalizing forces (for a critique of such historiography, see Bender 1978). Offering another variant of the standard wisdom, political scientists Gerald Gamm and Robert Putnam (1999, 513) use U.S. city directories from 1840 to 1940 to tally groups they assume were "obscure, scattered, and often small." Their analysis reveals that smaller cities and places outside the East had greater numbers of voluntary groups per capita. Reasoning from the theory of social capital outlined in Putnam's Making Democracy Work (1993), Gamm and Putnam (1999, 533, 549, 551) argue that the U.S. "civic core was in the periphery" because associations were "created and sustained most easily" in "slow-growing" communities that were "relatively small and homogeneous."

Indeed, theorists of social capital have become the latest exponents of the small-is-beautiful school of civic virtue. In this perspective "horizontally" but not "vertically" organized groups foster and sustain face-toface networks essential for healthy democracy. "Taking part in a choral society or a bird-watching club can teach self-discipline and an appreciation for the joys of successful collaboration," reasons Putnam (1993, 90); and small groups foster societal trust and governmental efficiency. To test such ideas, Putnam measured the density of purely local sports, recreational, and cultural groups in various regions of Italy. "Local branches of national organizations" were deliberately excluded because "organizations 'implanted' from the outside have a high failure rate," whereas "the most successful" groups are "indigenous... initiatives in relatively cohesive local communities" (Putnam 1993, 91-2, including n. 35). Invoking widely held ideas about U.S. civic history, Putnam (1993, 91-2) concludes that regions of Italy thick with local recreational and cultural groups "rival Tocqueville's America of congenital joiners."

AN ALTERNATIVE ACCOUNT OF AMERICAN ASSOCIATIONAL DEVELOPMENT

Small-as-beautiful understandings of America's civic past prevail today, but a quite different account appears in historian Arthur Schlesinger's (1944) classic article, "Biography of a Nation of Joiners." Focusing on "voluntary bodies of sizable membership, reasonably long duration, and fairly large territorial extent," Schlesinger (pp. 2, 25) portrays the development of a "vast and intricate mosaic" of large-scale associations "reaching out with interlocking memberships to all parts of the country."

In colonial America, Schlesinger (1944, 5) argues, voluntary groups were few and usually tied to local church congregations. But the struggle for independence from Britain taught "men from different sections valuable lessons in practical cooperation," and "the adoption of the Constitution stimulated still further

applications of the collective principle." A new associational model crystallized in the early 1800s, a time of flux and experimentation in the democratizing republic. Ambitious organizers developed a standard approach: They chose an "imposing" name, "sent forth . . . agents on the wide public," and "multiplied" "subsidiary societies . . . over the length and breadth of the land." Associations began to organize along the lines of "the Federal political system, with local units loosely linked together in state branches and these in turn sending representatives to a national body" (Schlesinger 1944, 11). Subsequently, the Civil War brought a "heightened sense of nationality," redoubled "Northern endeavors to plan far-flung undertakings," and so gave "magnified force" to association-building in the late 1800s (Schlesinger 1944, 16).

Although not explicitly theoretical, Schlesinger's overview highlights the role of national organizers who learned from political experience, and it suggests that translocal federations fostered local chapters. What is more, Schlesinger's evidence resonates with the ideas of scholars (e.g., Berman 1997; Evans 1997; Levi 1996; Tarrow 1996a) who criticize social capital theory for downplaying the influence of government in civil society. As Sidney Tarrow (1996a, 395) puts it, "the character of the state is external" to the social capital model, because "civic capacity" is seen "as a native soil in which state structures grow rather than one shaped by patterns of state building." Reinforcing doubts about such thinking, Schlesinger suggests that American voluntary groups developed in close relationship to the representative and federal institutions of the U.S. state.

UNRESOLVED ISSUES AND NEW EVIDENCE

Were nationally organized associations prevalent or scarce in America's past, and did translocal linkages encourage or undercut local voluntary groups? What, if anything, did governmental institutions and episodes of nation-state formation have to do with the development of U.S. membership associations? The contrasting perspectives we have reviewed need to be adjudicated with systematic data and methods of analysis. Ideally, we would like to draw a "sample" from a master directory listing membership groups of all types and sizes, past and present. But no such census exists; and post-1955 directories miss many groups that lived and died in the past. Because no straightforward random sample can be drawn, we triangulate, using several sources of data.

To explore Schlesinger's hypotheses more systematically than he was able to do, we consider not just scattered examples but the entire universe of very large U.S. membership associations, using data from an ongoing study (Skocpol et al. 1999) of the origins and development of all U.S. voluntary groups, apart from churches and political parties, that ever enrolled 1% or more of adults as members. In the larger study, directories and historical works were used to compile the names of groups whose membership might have ex-

ceeded 1% of U.S. adults (the baseline includes both genders for mixed associations, but 1% of men or women for single-gender groups). Data have been uncovered to determine that 58 associations exceeded this threshold. Here we examine 46 groups that recruited 1% of American men and/or women at any time prior to the 1940s, when Schlesinger's overview ended.¹

A study of only very large associations would obviously bias our findings, so we use two additional kinds of evidence. Historical directories and compilations (Breckinridge 1933, Part I; Palmer 1944; Preuss 1924; Schmidt 1980; Stevens 1899) enable us to situate very large groups in relation to other translocal organizations. In addition—and this is the crucial evidentiary aspect of our study—we use city directories to obtain listings of locally present voluntary groups of all kinds (see Appendix B). For the same geographically dispersed set of cities examined by Gamm and Putnam (1999), we ask what proportion of all groups listed in city directories were part of translocal federations. We also probe the relative stability of strictly local versus translocally connected groups. By combining different bodies of data and looking for overlaps between universes of national and local groups, we are able to go well beyond what previous scholars have done. We can document and theorize anew about the relationship of local to translocal association-building in the historical formation of American civil society.

LARGE MEMBERSHIP ASSOCIATIONS: PREVALENCE, FORMS, AND ORIGINS

Most observers assume that large voluntary associations (apart from political parties and religious denominations) were absent in preindustrial America. But conventional wisdom is mistaken, as Table 1 reveals. Moral crusades and political movements; labor unions and farmers' associations; veterans' and women's groups; recreational and civic associations; and fraternal groups of many sorts-undertakings of each type attracted hundreds of thousands or millions of members. To be sure, some large membership organizations passed out of existence after brief campaigns to attain a policy goal, and others flared up and died down within just a few years. Nevertheless, most of the 46 groups listed in Table 1 fit Schlesinger's conception of large and persistent membership associations. More than two-fifths crossed the 1% membership threshold before 1900, and more than three-quarters exceeded this mark before 1920. Large voluntary associations have flourished in all eras of U.S. history.

Table 1, which draws on group records, official histories, and scholarly studies (see Appendix A), indicates when and where the first organized unit of

each named association appeared and classifies the aims of the group's founders. In some cases, such as the Independent Order of Odd Fellows (Stillson 1897, 211-4) and the Young Men's Christian Association (Hopkins 1951, 15-9), the founders originally thought they were establishing what we call a local "portal" for a European-based group to pass into the United States.2 In other cases, founders envisaged a local group centered in a particular city or state and only later decided to pursue national ambitions. Other founders planned from the beginning to build a truly national association, even if it took some time to realize their plans. Still other founders negotiated combinations of previously formed local or regional groups. The General Federation of Women's Clubs (GFWC), for example, was pulled together in 1890 when the leaders of the Sorosis Club of New York City convened a meeting of about five dozen clubs from across the United States (Wells 1953, chap. 2).

Many scholars assume that combination of preexisting groups must have been the principal way national associations emerged, usually after the U.S. economy became more centralized at the very end of the nineteenth century. But Table 2 shows that the fusion of subnational groups was hardly the typical route by which ultimately large membership associations came into being. Combinations from below account for only 13% of all foundings of very large groups; and only another one-fifth were originally focused on a particular city or state. Remarkably, in more than three-fifths of cases, associational founders undertook national projects from the start; these launchings occurred from the early 1800s through the early 1900s.

Nation-State Formation and Voluntary Membership Federations

Major junctures of U.S. state formation clearly punctuated the development of translocal civil associations. No national groups emerged in colonial times. Apart from transnational religious denominations, the earliest translocal association was the Masons; lodges sprang up in cities, towns, and military garrisons, and "sovereign grand lodges" formed alongside the government of each colony. But the deeply rooted Masonic grand lodges (which corresponded to the states after the American Revolution) were never able to agree on a nationally unified governing structure (Stillson 1926, 226–7). Certain higher orders affiliated with Masonry eventually adopted unified structures, but basic "blue lodge" Masonry never took this institutional step.

The American Revolution and debates over the Constitution, along with contentious and evangelical religious movements in the new nation, spurred early Americans to organize all kinds of voluntary groups,

¹ Twelve other U.S. membership associations crossed the 1% threshold after 1940. Of these, five were founded and attained very large size between the late 1950s and the 1990s, seven others were founded before 1940 but grew very large only afterward. Reinforcing the conclusions reported below, six of seven founded before 1940 (and all five founded before 1920) were representative federations with intermediate tiers at the state or regional level.

² Two other associations included in tables 1 and 2 also moved into the United States from abroad: The Red Cross was founded as the U.S. national part of an international movement, and the Maccabees started in Ontario, Canada, and very quickly crossed the border with national ambitions in the United States. We classify both as national foundings, reserving the term "portal" for associations originally founded as local U.S. outposts of foreign-centered associations.

Note: For data sources, see Appendix A. "Duration" gives the date and location from which each named association was launched and inclosuse an ending date for groups that no longer exist. As further explaned in the text, "Scope" refers to the land of local or national association envisaged by the organizers at inception. "National Associational Structure" gives the date of adoption of the first national constitution and shows that 13 groups started with national/local arrangements, but seven of these later shifted to other structures. "Above 1%" shows all decades in which associational membership (even brieff) exceeded 1% of all U.S.

even in tiny towns (Brown 1974; Mathews 1969). Early in the life of the fledgling republic, moreover, popularly rooted membership associations were organized on a national scale. They took shape at the critical sociopolitical juncture between the 1820s and 1840s, when voting rights were extended to most U.S. adult males and competing political parties (themselves federations of local and state organizations) emerged to mobilize the mass electorate (Aldrich 1995, chap. 5; Shefter 1994, 66-71). The American Temperance Society, the American Anti-Slavery Society, and the General Union for Promoting the Observance of the Christian Sabbath (GUPOCS, which agitated to close U.S. post offices on Sunday) all aimed for large size and geographical spread because their organizers wanted to change national mores and influence state and national legislation. These massive crusades appealed to-and helped stimulate—a democratically aroused citizenry (John 1995, chaps. 5-7; Tyler 1944, Part III).

In the same era, nonpolitical groups also moved toward national projects and institutions. Of these, by far the most important was the Independent Order of Odd Fellows, which was destined to become an organizational model and seedbed for hundreds of other membership federations. Odd Fellows were the next significant fraternalists after the Masons to enter the United States; the original ones were transplanted English workingmen who met regularly to perform the moral rituals and acts of mutual aid for neighbors and travelers that were the transnational stuff of fraternal life (Clawson 1989). But Oddfellowship in America soon shifted from a series of coastal outposts of English orders into a national project under the tellingly labeled leadership of Baltimore's "Washington Lodge No. 1," which hoped to connect preexisting Englishchartered lodges while simultaneously chartering new ones in America. The Baltimore Odd Fellows split into multiple organizational levels during the 1820s, separating a "Grand Lodge of Maryland" from the original Washington Lodge, and then forming a new "Grand Lodge of the United States" juridically separate from the state-level unit (Independent Order of Odd Fellows [IOOF] 1844; Stillson 1897, Div. Π , Sec. I and Π). The leader in Baltimore, Thomas Ridgely, went on the road to persuade lodges in other states to join or form under the Maryland-centered jurisdiction. Potential recruits were made a very attractive offer: They could establish local and state lodges and send representatives to national meetings in Baltimore but would not be subordinated to the Marylanders.

American Odd Fellows fashioned a new structure that imitated and paralleled the U.S. constitutional order. As chronicler Henry Stillson (1897, 214) explains, immigrant members with "superior discernment" realized "the impracticality" and "especial unfitness for this country" of English-style governing arrangements (which coordinated local lodges through national committees of notables) and "found their model in the political framework of the United States." Probably the Marylanders led the way for much the same reason that small state representatives had been the first to ratify the 1789 U.S. Constitution: Representative federalism with state as well as a national "sovereign" jurisdictions afforded extra prestige and leverage to people from smaller states. Using their three institutional levels to outmaneuver New York City lodges, which harbored ambitions of their own, Baltimore Odd Fellows made themselves the founders of a new fraternal republic that broke from British allegiance to become America's Independent Order of Odd Fellows, whose new constitution unmistakably echoed the U.S. Constitution (IOOF 1844, xv):

Whereas, it has been found expedient, and of great importance to mankind, to perpetuate those institutions which confer on them great and essential benefit. Therefore, the GRAND LODGE OF THE UNITED STATES..., for the more effectual purpose of binding each other in the bond of one common Union, by which we will be enabled to insure a co-operation of action,... and to secure unto ourselves and posterity more effectually the blessings which are to be derived from so valuable and beneficial an institution, do ordain and establish the following as the CONSTITUTION... OF THE INDEPENDENT ORDER OF ODD FELLOWS.

Similar representative federal institutions were soon adopted by many other brotherhoods, including America's first indigenously spawned fraternal organization, the Improved Order of Red Men, which evolved from a Baltimore-centered "tribe" into a three-tiered order (Lichtman 1901, chaps. 5-6). More telling, three-tiered arrangements were adopted by minority-ethnic orders, such as the Ancient Order of Hibernians, launched in 1836 (Ridge 1986); the German Order of Harugari, launched in 1847 (Stevens 1899, 234-5); and the Bohemian Slavonic Benevolent Society, started in 1854 and explicitly modeled after the Odd Fellows (Martinek 1985, 22). As new ethnic groups arrived in the United States, they formed associational edifices topped with national and state bodies even when there were barely enough members to form chapters scattered across a few large cities.

Organizational routines that included local membership meetings, standardized rituals, and the dispatch of elected officers and representatives to regular state and national governing conventions soon proved attractive to more than just fraternal groups. Early mass temperance associations, for example, went through a period of organizational experiments, some of which faltered (Dannenbaum 1984; Krout 1925). The American Temperance Society proved too top-down to sustain its popular appeal, and it evolved into a national center for publishing and lobbying (much like late-twentiethcentury American professional advocacy groups). The Washingtonian movement experimented during the 1840s with radical, bottom-up democracy (much like 1960s-style New Leftists), only to find that loosely networked, entirely flexible local groups with few rules and no state or national governing structures could not sustain themselves beyond the initial popular fervor (Grosh 1842; Maxwell 1950). Thereafter, many Americans interested in "the temperance cause" flowed into the Sons of Temperance, founded in 1842, and the Independent Order of Good Templars (IOGT), founded in 1851, both of which achieved enduring new syntheses of moral fervor and representative federal organization. The Sons combined temperance advocacy with lodge rituals and the provision of social benefits (Hodges 1877); and the Good Templars adapted fraternal forms to America's first civic experiments with gender and racial inclusion, allowing women and African Americans to become members and serve as elected leaders (Fahey 1996).

If Schlesinger was right about early-nineteenth-century Americans converging on a model for large membership associations that paralleled governmental federalism, he was likewise correct that the Civil War brought a "heightened sense of nationality" to association-building. As Table 2 shows, associations that would manage to grow very large emerged at an accelerated rate starting in 1864, and most postwar foundings were nationally ambitious from the start. Half the eventually large groups founded between 1819 and 1859 were initially national projects, but in the late 1800s more than two-thirds of such launchings were

national projects.³ In the same era, hundreds of other nationally or regionally ambitious associations were also launched (Palmer 1944; Stevens 1899).

Following the Civil War, the national-state-local model diffused across various kinds of voluntary endeavors in addition to fraternal brotherhoods and sisterhoods. It was adopted by veterans' associations (from the Grand Army of the Republic to the American Legion); by independent women's groups (from the Woman's Christian Temperance Union, to the General Federation of Women's Clubs, to the National Congress of Mothers, which eventually became the modern PTA); by farmers' organizations (from the Grange, to the Farmers' Alliances, and ultimately the American Farm Bureau Federation); and by assorted moral and political crusades (including the YMCA, which added a state tier to its organizational structure in 1866, as well as Christian Endeavor, the American Protective Association, and the National American Woman Suffrage Association).

In one especially telling case, the Knights of Columbus, federalism hardly came easily. Founded in New Haven as a local Irish Catholic men's group, the Knights of Columbus was initially embedded in church parishes and dioceses and was closely supervised by Catholic clerics (Kaufman 1982, chaps. 1-4). As cognate groups emerged across Connecticut, they remained so embedded. But a deliberate switch to a local-state-national federated structure with elected lay leaders came in the late 1880s and 1890s, when leaders decided to take the Knights of Columbus national in competition with the Masonic Knights Templar and other Protestant-dominated fraternal associations. Pressures to compete and legitimize the undertaking drew the Knights of Columbus toward the governance model widely used by nationally ambitious associations of that time, even when "going federal" meant breaking from the original diocesan mold. The group also imitated the standard U.S. associational practice of electing lay officers, instead of having priests or bishops head its local, state, and national councils.

Overall, nearly three-quarters of the U.S. membership associations that grew very large before 1940 (34 of 46 groups) developed federated organizational arrangements that resembled the representative, three-tiered institutions of U.S. government. As Table 1 indicates, 28 of these 34 adopted the federal-state-local form when they first established a national organization. Six others shifted from a national-local arrangement to the multitiered structure that included state units. Interestingly, several of the associations that moved away from center-local arrangements did so after members outside the founding center pressed for the addition of state units with significant authority. For example, the General Federation of Women's

³ Many "national" federations incorporated modest numbers of members from English-speaking Canada, and sometimes people from Australasia and Europe as well. Although some of these were Americans living abroad, we do not count foreign-based members in deciding whether associations exceeded 1% of the U.S. adult population. Like Canadian baseball teams today, foreign chapters and members were incorporated into U.S.-centered insututions.

Clubs was orchestrated by New York clubwomen, but women's groups in Maine and Utah spontaneously established their own state federations and pressed the national center to accept the new institutional level (Wells 1953, 34–7). Similarly, soon after the 1898 launching of the Fraternal Order of Eagles in Seattle, Washington, members in New York campaigned to establish state-level "aeries" (Fraternal Order of Eagles 1913; O'Reilly 1904, 77–81).

Among the membership associations in Table 1 that did not adopt the federal-state-local format, four groups (the Knights of Labor, Red Cross, American Federation of Labor, and Congress of Industrial Organizations) developed other kinds of multitiered arrangements; two others, the blue-lodge Masons and the Washingtonian temperance movement, never developed national centers. Of the 46 U.S. voluntary associations that attained very large memberships before 1940, only six (13%) were permanently institutionalized as center-local organizations. A representatively governed intermediate tier, usually at the state level, was overwhelmingly typical.

Why Did National-State-Local Federalism Take Hold?

Institutional theories (see Hall and Taylor 1996) allow us to go beyond Schlesinger in understanding why America's largest membership associations (and hundreds of smaller ones as well) adopted an organizational structure similar to the institutional arrangements of U.S. government. Two arguments are relevant: hypotheses about "political opportunity structures" and ideas about organizational imitation.

Social movements often organize to take advantage of opportunities for leverage offered by governmental institutions (Kitschelt 1986; Tarrow 1996b). From the beginning, the American political system rewarded movements and associations able to coordinate efforts at the national, state, and local level. From temperance and antislavery crusades, to farmers' groups, women's movements, and nativist agitations, groups aiming to shape public opinion and influence legislators learned the advantage of cross-level organization. By serving as a bridge between local sets of citizens and elected

⁴ State organizations are not entirely absent in these cases. Masons, of course, have strong state-level grand lodges. The Red Cross made brief attempts to set up state units before settling on a regional arrangement. State organizations with very weak representation at the national level are parts of the AFL (and AFL-CIO), although international unions have always been the key units in the labor federations.

officials, associations could influence both Congress and state legislatures (for instances, see Skocpol 1992, parts 1, 3). Operating across levels, moreover, groups could pursue social as well as political change. "Our Order," explained the Right Worthy Grand Templar of the Independent Order of Good Templars (IOGT) in 1881 (quoted in Turnbull 1901, 88-9), "is organized to destroy the evils growing out of the drink traffic, and the individual use of alcoholic drinks." Because the "drunkard-makers have strong Local, State, and National Organizations," subordinate lodges reach out to save individuals and agitate public opinion, while "against the State Liquor Union" the IOGT arrays the state-level "Grand Lodge; and against the American Brewers' Congress and National Distillers Union" it deploys the national-level "R.W.G. Lodge."

But the response of activists to political opportunities and challenges is not a sufficient explanation, because many nonpolitical associations also adopted representative-federal arrangements. For the Odd Fellows, the Knights of Columbus, and other ritual or social associations, constitutional federalism was a way to coordinate activities across localities and regions. According to institutional theorists of organizational development (Powell and DiMaggio 1991), organization-builders who face complex challenges in conditions of uncertainty are inclined to copy well-understood, already legitimate models in their environment. Dynamic variants of sociological institutionalism (e.g., Clemens 1997) suggest that innovative adaptations of this sort are likely when ambitious but somewhat marginalized organizers (such as immigrants to America) confront unprecedented challenges or opportunities and are able to draw on a new "repertoire" of collective action. After the American Revolution, the U.S. Constitution offered a widely understood and prestigious model for cross-local coordination in an era when popular mobilization made sense for all kinds of purposes. Once some groups used this model successfully, others found it legitimating and competitively advantageous to follow suit.

Still, as the United States industrialized, representative-federal associations might have given way to classdivided or corporate-style associations paralleling the emergent national market economy. But a cataclysmic and pivotal political event, the U.S. Civil War, intervened to reinforce the legitimacy and practicality of popularly rooted federalism as the preeminent model for large-scale association-building. The United States in 1860 had little in the way of a standing army, so both sides in this internecine struggle relied upon civilian as well as elected leaders to assemble local volunteers into state units, and then to mold state units into the clashing armies and civilian relief organizations of the Union and the Confederacy (Brockett 1864; McPherson 1988, chap. 10). After the war ended, spirits soared on the winning Union side. Inspired by a new sense of national purpose and thoroughly familiar with federal models of popular mobilization, northern men and women who grew to maturity in the late 1800s launched many new mass-based federations, even as

of these, GUPOCS was a short-lived movement of church-based groups and individual petition-aigners; the Boy Scout troops and Townsend/Old Age Revolving Pensions groups were coordinated by corporate-style directorates. Center-local arrangements characterize the Elks, the Moose, and the Shriners, all of which evolved from interurban networks originally devoted to recreational activities. Interestingly, some years after the national foundings, factions within both the Moose and the Elks agitated for the establishment of state grand lodges. Such efforts did not succeed because the urban lodges did not want to give up their direct ties to the national center. Nevertheless, purely voluntary, nonsovereign state associations are allowed by both the Moose and the Elks.

electoral mobilization by clashing party federations also reached its peak (McGerr 1986).

Qualitative evidence suggests ways in which Union mobilization encouraged postwar association-building. Railroad workers who met during the Civil War launched the Ancient Order of United Workmen from Meadville, Pennsylvania, in 1868, aiming to bridge class divisions and offer insurance and cultural uplift to all American working men (Upchurch 1887). America's third largest fraternal association, the Knights of Pythias, was founded in Washington, D.C., in 1864 by young clerks who met in the wartime civil service and devised a ritual of sacrificial brotherhood that appealed not only to former soldiers but also to all Americans who hoped to reknit North and South (Carnahan 1890, chaps. 5-6). Another regionally disparate group of federal clerks started the Patrons of Husbandry (or Grange) in 1867. This happened after Minnesota native and federal agriculture official Oliver Kelley was commissioned by President Andrew Johnson to assess rural needs in the devastated South (Nordin 1974, chap. 1). Using Masonic ties to make contacts in the defeated region, Kelley soon realized that farmers, too, could benefit from a nationwide fraternity. With fellow officials-each of whom, like him, moved back and forth between Washington and his home region-Kelley designed a federation that incorporated some existing farm groups and stimulated the founding of thousands of local granges.

The Civil War also emboldened civicly minded women. Along with the famous wartime nurse Clara Barton, many other women and men who had been active in the wartime U.S. Sanitary Commission agitated from the 1860s to 1881 for congressional charter of the American Red Cross (Davidson 1950b). Meanwhile, females moved to the fore in the massive temperance movement. Willing to accept women leaders and members on equal terms, the IOGT held its own during the war and burgeoned afterward, prodding the Sons of Temperance to accept females. But American women wanted an even more predominant role. Determined to counter male drunkenness, which had been exacerbated by military service, and fight government policies favorable to the liquor industry, which had become a lucrative source of tax revenues during the war, reformers convened in Cleveland, Ohio, in 1874 to launch the Woman's Christian Temperance Union (WCTU). Some of these women had met in Union relief efforts; all of them applauded the women's crusades against saloon-keepers that spread in the Midwest during the early 1870s (Mezvinsky 1959). Grassroots protests were hard to sustain, however, so women gathered at a summer camp for the National Sunday School Assembly to institutionalize "the grand temperance uprising." In cadences resonant with the "Onward Christian Soldiers" rhetoric of Union victory, a "Committee of Organization . . . consisting of one lady from each state" issued a "Call" to organize the national WCTU (reprinted in Tyler 1949, 18). "In union and in organization," proclaimed the Call, "are . . . success and permanence, and the consequent redemption of this land from the curse of intemperance."

NATIONAL FEDERATIONS AND LOCAL GROUPS

Although translocal voluntary federations may have emerged early in U.S. history and proliferated after the Civil War, it is possible that local groups weighed much heavier in community life. And perhaps chapters of large federations often proved short-lived, as social capital theory might predict, leaving the ground to be tilled by purely local joiners and organizers. To evaluate these possibilities, we need data on characteristics of local groups.

Membership Groups in City Directories

Gamm and Putnam (1999, 524) show that voluntary groups listed in U.S. city directories peaked in relation to population around 1910. What kinds of groups were these? To find out, we analyzed listings for 1910 (or the closest year available) for the same 26 cities from every region studied by Gamm and Putnam.⁶ In Table 3, cities are arrayed from top to bottom according to their size in the 1910 Census, and their groups are classified into structural categories. We count as "federated" several kinds of translocally linked groups: churches, unions, chapters of very large U.S. federations (listed in Table 1), and chapters of smaller federations. We tally as "nonfederated" all membership groups, including church-linked sodalities, that were not clearly part of separately organized translocal federations.

Had we eliminated local units affiliated with translocal associations (as in Putnam 1993), we would have missed most of the groups tallied in Table 3. In every city, most of the groups listed in the directories were part of regional or national federations, ranging from a minimum of 63% in Boston to a maximum of 94.5% in Rome, Georgia. Local groups not so connected were slightly more prevalent in the larger cities, whereas groups in the smallest cities were overwhelmingly federated. Looking more closely, we see that, in addition to churches, very large membership associations were at the very heart of American civil society locally as well as nationally. Churches and other religious congregations, devoted to translocal world views and linked to federated institutions of various sorts, were numerous in every city. Equally prevalent were local chapters of large membership federations listed in Table 1. And most "unions" were linked to the American Federation of Labor or the Knights of Labor.

From 8% to 29% of groups in these cities were local chapters of federations other than the very largest. These smaller federations, which ranged from ethnic

⁶ We are grateful to Gamm and Putnam for giving us copies of some of the directories they used. In most cases, we obtained copies from libraries or historical societies in the respective cities or used microfilms in the extensive collection of city directories held by the Boston Public Library. These copies were either for the same years or within one year of directories used by Gamm and Putnam (1999, Appendix A).

and insurance-oriented fraternal groups to nativist, patriotic, and service associations, were organized and functioned in ways similar to the large associations listed in Table 1. They held regular local meetings and supralocal conventions, and they deployed organizers and members to spread their message and establish chapters on a regional if not national scale.

Local groups not obviously linked to broader federations ranged from 5.5% of directory entries in Rome, Georgia, to 37% of entries for Boston. But some of these groups clearly had constituencies that transcended city boundaries. Large cities (like Boston) hosted headquarters for national or regional associations; smaller cities (like Boise, the largest in Idaho) sometimes served as associational centers for their state or region. In the final analysis, only a minority of the groups listed in each city directory (22% was the average across 26 sites) was specific to that city or county.7 Many of these were business or professional associations or elite clubs of one sort or another, which are hardly prime venues of democratic engagement. Choral groups, mutual aid societies, church sodalities, orchestras and bands, and sports and recreational clubs-the sorts of purely local, popular groups Putnam (1993, 91-2) considers typical of civic Americaaccounted for only a tiny fraction of groups in these

cities. In classic U.S. associational life, most popularly rooted groups were parts of translocal federations.8

Persistence and Volatility

Although the cross-sectional tallies in Table 3 reveal large proportions of federated groups, perhaps translocally linked churches, unions, and chapters were too short-lived to have much civic significance. To find out, we explored group stability. Analysis was done by hand by a knowledgeable coder, and issues of consistent coverage across directories had to be resolved (see Appendix B). We examined groups in eight regionally dispersed small cities, and we focused on similar times (circa 1890, 1900, 1910, and 1920) in order to control as much as possible for nationwide associational trends.9 In each city, we traced named groups (such as "Beacon Street Methodist Church" or "Maple City Camp No. 2884" of the Modern Woodmen). Groups are classified as relatively stable if they appear in three or more consecutive directories or in the last two.

As Table 4 shows, religious congregations were extraordinarily stable in these cities (with the partial exception of Rome, Georgia, which had a dispropor-

⁷ The average percentages presented in Table 3 are not weighted by the relative number of groups in different cities. Because larger cities (especially Boston) had somewhat more headquarters and local groups, "nonfederated groups" are 26% of all groups summed across all cities.

Were purely local groups more prevalent in decades before 1910? Examination of directories back to the 1870s suggests that federated groups were proportionately even more prevalent in earlier decades. We used all except three of Gamm and Putnam's (1999) eleven small cities; the others were set aside because directories with comparable coverage were not available at times close to the decade intervals.

tionately large number of churches, including some volatile white and African American Baptist congregations). Local chapters of America's largest voluntary federations (apart from AFL unions and the Knights of Labor) were also quite stable. In contrast, nonfederated local groups were not very persistent, contrary to what social capital theory suggests.

Among federated groups, unions were markedly less stable than churches and chapters of large membership federations. Part of the reason may be that labor groups were not consistently included by compilers of city directories. But when labor groups were listed, they often appeared at just one decade point, because they rose or fell in response to industrial struggles and economic booms and busts. For example, unions and Knights of Labor assemblies disappeared following the defeat of strikes in Leadville, Colorado, and unions multiplied temporarily during the ship-building boom in Bath, Maine, during World War I.

In six of the eight small cities, units of translocal federations other than the very largest were more persistent than nonfederated local groups, but in all eight cities such smaller federated units were much less persistent than chapters of the largest federations. The era between 1880 and 1920 witnessed the rise and demise of hundreds of insurance-providing fraternal associations (such as the Order of the Iron Hall and the Knights and Ladies of the Fireside), the vast majority of which remained modest in membership. Many of these groups soon proved economically insolvent, and the more successful ones tended to merge or turn into insurance companies after 1910.

Churches and local units of the largest voluntary federations proved the most persistent. The average of city percentages in Table 4 shows this, and another calculation documents the same point. Adding together all 450 groups that were relatively stable across these eight cities between 1890 and 1920, we find that 31% were religious congregations and another 38% were clubs or lodges connected to the largest crossclass national federations. Thus, more than two-thirds of all stable groups fell into these categories. Once founded, churches and chapters linked to the largest federations took firm root and became the enduring core of civil society in modernizing America.

Chapters of major federations flourished in part because national and state leaders in such vast civic republics as the Odd Fellows, the Grand Army of the Republic, and the WCTU assumed responsibility for sustaining as well as initiating local chapters. Reports of annual or biennial meetings describe all the steps taken by elected officers-and the many miles they traveled-to shepherd their flocks. To enhance their reputation for sound leadership, supralocal officers not only offered inspiration and programmatic suggestions but also fostered connections among chapters in their orbit. When a local club or lodge ran into trouble, moreover, supralocal leaders could make a real difference, especially in the larger, well-established federations. They might ask neighboring chapters to support faltering units (as in the "Big Brother Aerie" program mounted by the Fraternal Order of Eagles). During economic downturns, national or state officials might forgive shares of local dues; when meeting houses burned down, they orchestrated appeals for aid. Support from above could sustain locals of major federations, whereas disconnected groups or the chapters of weak federations often faltered.

VOLUNTARY FEDERATIONS IN A NATION ON THE MOVE

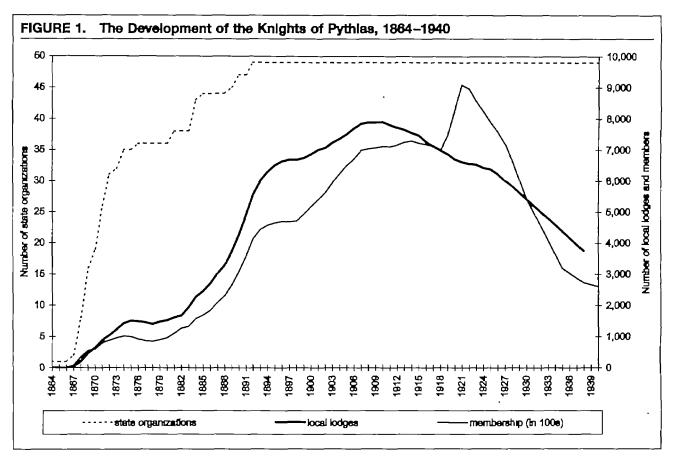

Because large membership federations were central to local communities as well as the nation, we need to know more about how they developed. As a first step, we can dissect the growth of very large membership federations with units at the state level as well as the local and national levels. How were such federations assembled?

We can readily imagine a pattern in which, after national organizers declare a new project, local groups spread and memberships swell; only later do state-level units emerge. In fact, a very different dynamic usually prevailed, namely, an encompassing network of statelevel units formed very early in the life of expanding federations. To illustrate this point, figures 1 and 2 display the slopes of membership growth and local and state organizational trends for the Knights of Pythias, a giant fraternal group that grew from a national project launched at the end of the Civil War, and for the General Federation of Women's Clubs (GFWC), which formed in 1890 as a combination of city groups. Despite disparate origins, both the Knights and the GFWC became institutionalized across many states well before their memberships burgeoned and before most local units were established.

These instances are not atypical. Figure 3 analyzes the relationship of membership growth and cross-state institutionalization for 30 of the 34 federal-state-local groups listed in Table 1 (Appendix A discusses the four omissions). This figure documents a strong relationship between the timing of recruitment of at least 1% of men and/or women and the timing of institutionalization in at least 60% of then-existing states and territories. 10 Extensive institutionalization and large membership growth often occurred around the same time: Half the groups in Figure 3 are on or very close to the diagonal. Yet, the figure clearly shows that 11 of 30 groups (37%) established institutions spanning at least 60% of states before recruiting 1% of adults into membership, even though this was quite an organizational feat at a time when new states and organized territories were joining the nation in thinly populated regions. For example, the WCTU is situated well below the diagonal in Figure 3; it had established "unions" in 60% of states and territories by the early 1880s, considerably before it had enrolled 1% of women (in the late 1910s).¹¹ Only three groups appear far above

¹⁰ We also examined charts with higher thresholds of state organization. Raising the bar to 70% or 75% causes data points to crowd toward the diagonal but does not change the underlying patterns reported here.

¹¹ The founding of a state unit was a significant marker of associa-

the diagonal in Figure 3, and two of these are only partially exceptional. The Woman's Missionary Union established state units across the South before recruiting its initial membership there; later, it added members in other regions before completing a nationwide state network. Starting from the West, the Fraternal Order of Eagles followed a similar pattern. Both federations began by spreading a wide cross-state institutional network within their home regions.

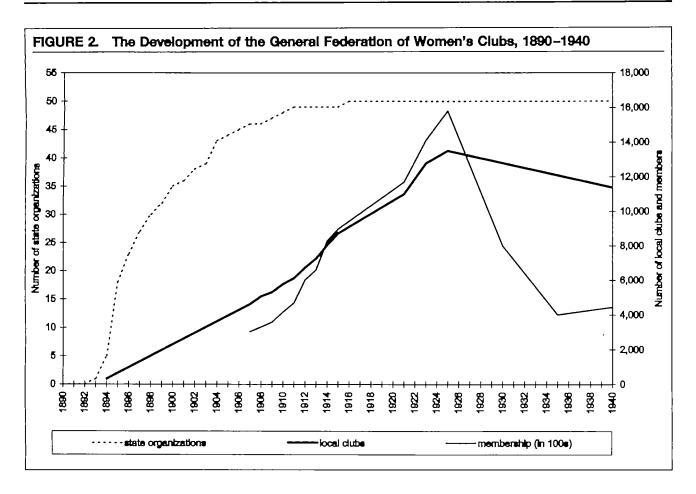

The fact that a wide network of state organizations was usually institutionalized before, or along with, the growth of substantial membership is strong evidence that intermediate as well as national institutions were important to the growth of U.S. voluntarism. Intermediate units were not just after-the-fact window-dressing for American voluntary federations. But what could supralocal institutions—national or intermediate possibly contribute in an era when voluntary groups depended on the willingness of many ordinary men and women to attend meetings regularly and pay dues? To prosper, almost all classic American voluntary federations had to sink strong roots in local communities and neighborhoods. How could apparently elaborate and top-heavy federal arrangements, replete with offices, paid organizers, and subsidized travel for elected leaders, possibly have aided that process?

We theorize that federal frameworks sustained na-

tional presence. Rules varied among federations, but from five to twelve local chapters normally had to be established in the state or territory before leaders could apply to the national center to "charter" a sovereign and representative state organization.

tionwide leadership networks and provided career lines, resources, and incentives for membership organizers. In the modernizing United States, nationally ambitious civic leaders had to spread ideas and recruit members in many places across a vast continent. Associational founders, such as Thomas Wildey of the Odd Fellows and Frances Willard of the WCTU, were constantly on the move, visiting as many locations as possible. Inspiring and effective, they seeded new groups wherever they went (on Wildey, see Stillson 1897, Div. II and III; on Willard, see Bordin 1986, chap. 8). Even so, hundreds to thousands of intermediate leaders had to do most of the work. Only they could tap into indigenous social networks and spread an association's ideals and models into every city and town, casting the net of membership and organization farther and farther afield. In turn, intermediate leaders had to be able to claim credit, coordinate activities, and gain access to portions of local dues. It made sense for national association-builders to foster, as soon as possible, intermediate institutions through which further organizing could proceed.

Embodying shared ideals and standardized associational routines, higher level leaders and institutional centers mattered precisely because the modernizing United States was so geographically and socially dynamic. Nineteenth-century Americans were constantly on the move, especially young men looking for work and entrepreneurial opportunities (Chudacoff 1972; Kopf 1977); indeed, interstate mobility rates reached an all-time peak in the mid-1800s (Hall and Ruggles

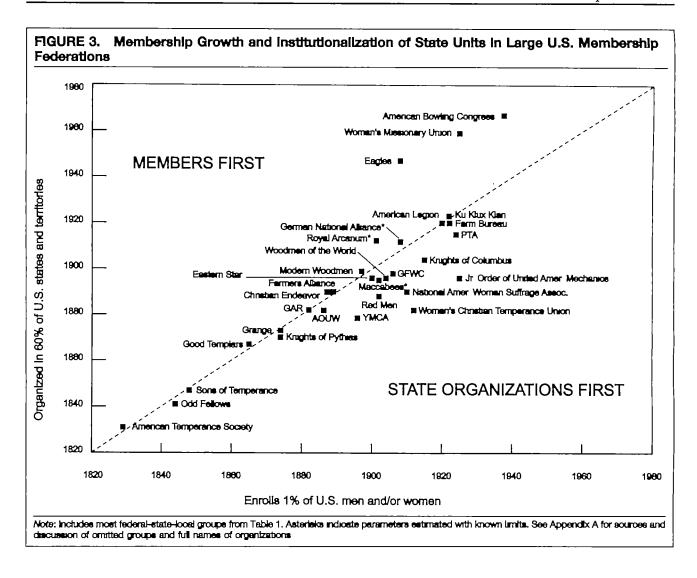

1999). As the United States expanded, translocally organized associations were very appealing (Berthoff 1971, chap. 27). People arriving in new places looked for familiar group meetings; members arranged "traveling cards" or introductions from native lodges or clubs to allow them admittance to cognate units elsewhere. Furthermore, if the new places did not already have familiar groups, authoritative supralocal centers and widely shared knowledge of standardized associational routines allowed members to become instant civic organizers. Strangers who shared the bond of membership in a nationwide association could coordinate their efforts, and local activists could contact leaders at higher levels for guidance and reinforcement. Based on primary testimonies, scenarios such as the following played out again and again. Each excerpt reveals notable feats of collective action by mobile Americans aided by national and state institutional centers and a translocal network of leaders.

The first Odd Fellows' lodge established in the Western Mississippi valley was Travellers' Rest Lodge, No. 1, in the city of St. Louis, for which a charter was granted by the Grand Lodge of the United States on the 18th of August, 1834.... St. Louis was then an insignificant frontier town, with about 7000 inhabitants. There were seven petitioners for this lodge "made up" of transient members then in and about the city: one from England; two from Kentucky; three from Pennsylvania; and one from Maryland. By the time the lodge was instituted all but one of the original signers of the petition had disappeared and others had to be substituted.... Samuel L. Miller of Harmony Lodge,

No. 3, of Baltimore, who was about to remove to Alton, Illinois, was commissioned [by the U.S. Grand Lodge in Maryland] to institute the lodge... At the close of the first year the lodge had 115 members" (reported in Stillson 1897, 355).

Being an account of the introduction of the Order of Knights of Pythias in the Grand Domain of Minnesota by ... David Royal who has been a continuous member of Minneapolis Lodge No. 1 for 27 years. In November 1868 I joined Wilmington Lodge No. 2 Wilmington Delaware. In the spring of '69 I arrived in this City [Minneapolis] and shortly after was employed as car builder for the C.M. & St. Paul Railways at their Shops in this City. In the winter of '69-70 I talked up Pythianism among the workmen and soon had a list of 13 names. I opened up correspondence with Supreme Chancelor Read who sent me some Blank applications for a dispensation [to open a lodge] and full instructions how to procede. About the first of June I received a letter from Supreme Chancelor Read stating that Bro[ther] Jacob H. Heisser of Marrion Lodge No. 1 of Indianapolis Ind had recently arrived in Minneapolis and had also written him about starting a Lodge. I was requested to drop Bro Heisser a line through the Post office and unite our efforts which request was complied

Saturday evening June 25 1870 a preliminary meeting was called [to apply for a charter].... I was chosen President and Bro Heisser [who had recruited two potential members was chosen] Secretary.... Supreme Chancellor Read arrived July 9th 1870.... At Odd Fellows Hall Minneapolis Minn July 11 1870 agreeable to a call of the Supreme Chancelor of the Knights of Pythias Samuel Read of New Jersey a number of Knights and Citizens of

Minneapolis and vicinity assembled for the purpose of organizing a Lodge of the Order (Royal [1890s] n.d.).

There are now [in the 1890s] seventy [women's] clubs in the Nebraska State Federation, and applications for membership constantly arriving. . . . To fully understand what State federation has done, it is well to consider that more than two-thirds of the clubs now auxiliary to it were coexistent with it, and would never have been formed at all but for the permanence of organization and the wider range of thought which union with it and the General Federation promised. In one town of about fifteen hundred inhabitants there had been no literary organization of any kind for ten years previous to this movement. The same is true of many other towns on these prairies, each with its quotient of intelligent, well-educated people, transplanted from the cultured atmosphere of the older States, who had become discouraged by the difficulties of their environment, but who are now developing State pride, and are enthusiastically alive to all the privileges of federated clubs (reported in Croly 1898, 779).

National and intermediate institutions, representatively governed, helped the modernizing United States become a nation of associational organizers as well as a collection of potential joiners. Supralocal centers provided resources and created incentives for leaders to

reach out and help establish new local units, even as these same centers continued to link and inspire the efforts of established chapters. Nationally standardized and shared institutional models also made it possible for every associational member to become an organizer, should need or opportunity arise (as it did for David Royal and Jacob Heisser after they arrived separately in Minneapolis). Supralocal institutions were anything but irrelevant or oppressive bureaucratic overhead. By making it easier for Americans to "combine," even when (actual or potential) "brothers" and "sisters" did not previously know one another personally, these arrangements furthered associational vitality in an expanding and mobile nation. Disparate local groups bubbling up sporadically and informally from below could never, we submit, have achieved the same widespread and stable civic results.

RECONCEPTUALIZING CIVIC VITALITY IN AMERICA AND BEYOND

Our findings reveal the theoretical as well as empirical weaknesses of localist arguments about the roots of American civic voluntarism. Drawing on social

capital ideas, for example, Gamm and Putnam (1999, 551), hypothesize that small American cities were associationally prolific around 1900 because they were more socially enclosed than large metropolises. In fact, cities of all sizes in modernizing America were well connected to one another and to rural hinterlands, and voluntary groups in communities of all sizes were usually part of the same nation-spanning voluntary federations. Indeed, groups located in the smallest cities were the most federated of all. This makes sense because associational organizers tried to spread their network into even very small places, and because Americans on the move wanted to found or join familiar groups near home or work. In the apt words of the quotation regarding the Nebraska State Federation of Women's Clubs, federated chapters linked their participants to "the permanence of organization and wider range of thought ... promised" by "union with" representative state and national associational centers. Classic American voluntary associations were not at all expressions of geographically bounded social enclosure. 12 Multitiered national federations were the key institutional supports of classic American voluntarism because they simultaneously sustained intimate solidarities and connections to wider worlds.

Although often discussed as either top-down or bottom-up creations, classic U.S. membership federations were actually a well-institutionalized combination of both processes. Supralocal leaders articulated shared goals, world views, and identities, even as they spread organizational models and helped local chapters organize, persist, and pursue varied activities. Authoritative federations were effective holding environments for civic life. But they were not bureaucratic because they operated on representative principles and relied on the willingness of ordinary people to join local chapters, attend meetings, pay dues, and elect conscientious officers. Local chapters channeled indispensable resources of money and human energy to the "higher" levels of federations. Constructed as intricate combinations of organizational authority and member engagement, America's great voluntary federations could help geographically mobile citizens create, coordinate, and sustain local voluntary groups as well as simultaneously generate sufficient clout to affect politics or societal mores beyond as well as within local communities. An example such as the Ku Klux Klan

shows that federated associations did not always weigh in on the side of the good. And they did not always hold together or grow very large; like the early United States itself, many broke apart in internecine battles. But voluntary federations that successfully managed their internal conflicts could recruit large numbers of members and exert great influence in national as well as local American life.

Our research not only substantiates an institutional and translocal conception of American voluntarism it also suggests that government and politics need to be integrated into research on the formation of civil societies. Commentators often assert that early Americans created and relied on purely local voluntary groups because the pre-New Deal state was too weak to accomplish collective tasks. This standard wisdom neither notices nor explains the development of nationally federated membership associations that so closely mirrored the representative and federal arrangements of U.S. government and proliferated in close relationship to key episodes of nation-state formation.

The American state was not the sort of bulky, authoritarian bureaucracy whose deleterious effects on civil society Alexis de Tocqueville feared. From the start, U.S. constitutional government was nevertheless pervasive and effective in many ways. The Bill of Rights broke the unity of state and church authority, which allowed citizen-run associations to compete freely with one another and with a plurality of evangelizing churches (Brown 1974; Mathews 1969). The U.S. Congress developed the world's most efficient postal service and a system of postal and transportation subsidies that allowed places far from the Eastern seaboard to become full participants in national life (John 1995). The U.S. state thus furthered both coordination and competition, even as it afforded opportunities for political leverage at the local, state, and national level. What is more, popular struggles to create and preserve the U.S. state taught Americans to use constitutions and representative-federal organizations in many kinds of associational endeavors. Modeling their efforts on those used in political and military mobilizations, civic organizers in the developing American republic assembled voluntary membership federations that tied leader-organizers to one another and linked local groups to larger undertakings.

Emergent U.S. national institutions afforded unique opportunities for citizen-run voluntary federations—in the space between competing, nonofficial churches, on the one hand, and representative government, on the other. Significantly, both translocal voluntary federations and mass political parties took shape in the United States well before national corporations emerged to dominate the market economy. Early in the modernization process, American association-builders synthesized routines borrowed from representative government with world views borrowed from religion (usually ideas blended from Protestant denominations). Remarkably, U.S. voluntary associations achieved this synthesis of representative governance and moral purpose without becoming captives of either church or state. In many complex societies, voluntary

¹² Of course, many classic federations were gender-specific, racially exclusive, and centered on Protestants. Yet, it is important to underline the surprising inclusiveness of some of the largest or most influential voluntary federations, even apart from labor groups. African Americans were at least partially included in the IOGT, the WCTU, and the military veterans' associations; women participated along with men in the IOGT and the Grange. American women also ran many of their own great federations, long before the modern feminist era. Although not willing to accept African Americans, a number of the largest fraternals did include Jewish lodges as well as ethnic-identified lodges that were allowed to conduct activities in many European languages. Surprisingly, the early Odd Fellows allowed Spanish-speaking lodges in Florida (see Stillson 1897, 331). What is more, most classic voluntary federations brought together people from various occupations and classes, a form of inclusiveness arguably not often found in U.S. associations today.

groups have been controlled by powerful states or religious hierarchies, but in America lay citizens took charge.

CIVIC AMERICA FROM PAST TO PRESENT

We have focused on the emergence and initial spread of popularly rooted U.S. membership federations. A more complete overview would note the struggles experienced by almost all dues-based federations during the Great Depression and would highlight the symbiotic partnerships between the federal government and large voluntary federations that helped the nation mobilize for World War I and II, culminating in remarkable voluntary membership spurts after each great conflict. Although particular groups rose and fell, chapter-based federations of the sort that first took shape between the mid-1800s and the 1920s continued to underpin U.S. civil society through the first twothirds of the twentieth century (Skocpol et al. 1999). Only after the mid-1960s did membership federations in general experience sharp decline, as new social movements and professionally run advocacy associations transformed civic life in unprecedented ways.

Today, many Americans are so disillusioned with national government and politics—indeed, with all authoritative institutions—that they are prepared to picture "Tocqueville's America" as a collection of spontaneous local efforts detached from government and politics. Similarly, many who worry that the United States is no longer a nation of voters and joiners hope that civic revitalization can occur apolitically and from the bottom up: Perhaps citizens can redress the nation's ills while organizing children's soccer games; perhaps foundations can solve national problems by dribbling tax-exempt grants to local community groups. But a more accurate picture of America's past suggests the need to think in new ways about contemporary civic dilemmas.

If the United States originally became a civic nation because translocal federations grew parallel to the institutions of national republican government, then Americans today need to worry about the decline of representative democracy as an arena and positive model for associational life. And if classic American membership groups were not just scattered local creations, but were linked into well-institutionalized national networks that used membership dues to support elected leaders who had authority and incentive to organize large numbers of fellow citizens, then perhaps revitalization of American civic life today will take more than efforts by self-appointed professional advocates operating out of Washington, D.C., or New York City, and more than the disconnected efforts of small groups operating apart from national politics and translocal movements. Perhaps the best aspects of America's civic past are not being perpetuated or replaced in today's civic world, where market models are displacing representative arrangements, and where

civic leadership no longer entails popular mobilization or the organization of interactive associations.¹³

An institutional approach to civic life suggests that state, politics, and society are—for better or worse inevitably intertwined. From this perspective, the key to civic health lies not in local face-to-face interactions alone but in the nature of connections between powerful supralocal institutions and local or particular endeavors (for further arguments to this effect, see Berman 1997; Eckstein 1961; Evans 1997; Foley and Edwards 1999; Tarrow 1996a). Democratic accountability and balances of power are also critical, for "when bad men combine, the good must associate, else they will fail, one by one, an unpitied sacrifice in a contemptible struggle" (Knights of Labor of North America 1883, title page). Institutional and power realities shaped America's rich civic heritage, and they remain relevant today. Consequently, Americans who better understand their civic past may need to reimagine their democratic future and look to revitalize shared and representative institutions not just in national politics but in associational life as well.

APPENDIX A: DATA ABOUT LARGE U.S. MEMBERSHIP ASSOCIATIONS

Multiple primary and secondary sources were used to understand the origins and organizational arrangements of each large U.S. voluntary association listed in Table 1. In addition to the scholarly studies and official associational histories listed below, we examined groups' constitutions, which are listed separately only when they establish points not documented elsewhere. For figures 1–3, the dates for state foundings and national membership and chapter trends in most cases were determined from associational records or convention proceedings. Otherwise, the secondary sources below that are marked with an asterisk (*) were used for such data, or the best available estimates.

In Figure 3, estimates for the Maccabees, Royal Arcanum, and German National Alliance were made from substantial but incomplete data on membership and state foundings. Figure 3 omits 4 of the 34 federal-state-local associations in Table 1. The American Anti-Slavery Society, the Colored Farmers' Alliance, and the American Protective Association were excluded from the figure because they were short-lived, regionally centered, and never reached 60% of states; for the American Automobile Association, we have not yet obtained founding dates for state associations.

American Anti-Slavery Society: American Anti-Slavery Society 1834; Myers 1961.

American Automobile Association: American Automobile Association 1952; Partridge 1952.

American Bowling Congress: Matzelle and Schneider 1995; American Bowling Congress 1999.

American Farm Bureau Federation: Hansen 1991; Kile 1921. American Federation of Labor: Taft 1957.

American Legion: Pencak 1989.

American Protective Association: *Desmond 1912; *Kinzer 1964.

¹³ For arguments along these lines, see Ganz 1994, Rosenstone and Hansen 1993, Schier 2000, Skocpol 1999, and Weir and Ganz 1997. For a variety of other perspectives on contemporary civic transformations, see Berry 1999, Minkoff 1997, Putnam 2000, Schudson 1998, and Wuthnow 1998.

American Red Cross: Davidson 1950a, 1950b.

American Temperance Society: Krout 1925.

Ancient and Accepted Free Masons: Stillson 1926.

Ancient Order of United Workmen [AOUW]: Stevens 1899, 128-30; Upchurch 1887.

Young Men's Christian Association: Hopkins 1951.

APPENDIX B: CITY DIRECTORY DATA

Tables 3 and 4 are based on counts of membership-based associations listed in city directories for the dates specified in each table, and the definitions used to classify groups are given in the note to Table 3. Around 1900, U.S. city directories were compiled by local companies that came and went, which means they did a reasonable job of including groups of local interest but did not always cover exactly the same kinds of groups in equal detail. Although there was considerable imitation in formats from city to city and company to company, in order for valid comparisons to be made across time and place, directories must be scrutinized carefully to make sure they include the same kinds of groups. We have done this and taken some steps to correct for blatant omissions.

Labor groups were not always included in these directories. The Boston directory of 1910–11, for example, simply omitted most trade unions; we used instead a full list published by the Massachusetts Bureau of Statistics (1910). Scranton, Pennsylvania, directories included unions in 1900 but in 1910 referred readers elsewhere for a full listing. Without access to the other source, we estimated Scranton unions in 1910 as the 1900 number (which was very close to the 1920 number). We have not been able to correct for obvious omissions of unions in other directories, such as those for Des Moines, Iowa, and Troy, New York.

African American associations were erratically included in the directories for Rome, Georgia. Our counts for churches in Rome include African American congregations, which were consistently listed under a separate heading in every directory we used for the 1890 to 1920 period. But African American fraternal groups were listed in only one of the four directories used for Table 4, so we excluded them in order to maintain comparable coverage and to avoid overestimating unstable groups in this city.

The Sovereignless State and Locke's Language of Obligation

JOHN T. SCOTT University of California, Davis

odern liberal states are founded on individual rights and popular sovereignty. These doctrines are conceptually and historically intertwined but are in theoretical and practical tension. Locke's political theory is a source for proponents of both doctrines, and the same tension that runs through modern liberal thought and practice can be found in his theory. Rather than define the state in terms of a single sovereign authority, Locke constructs a sovereignless commonwealth with several coexasting claimants to supreme authority. He rejects sovereignty as what unifies the state, and he wants to replace the discourse of sovereignty theory with a language of obligation that will help bind together the sovereignless state. This language permits its adherents to articulate the reasonable basis and limits of political power. An understanding of Locke's sovereignless state helps us better comprehend the tensions embodied in discourses about individual natural rights, popular sovereignty, and governmental authority heard in the liberal state.

odern liberal states are founded on doctrines of both individual rights and popular sovereignty. In the United States, citizens can appeal to the Declaration of Independence and its proclamation of inalienable natural rights as well as to the Constitution and the language of "we the people" forming a more perfect union. Although conceptually and historically intertwined (Tully 1983, 11–3), these two doctrines are in theoretical and practical tension. This tension is visible in attempts within the political and legal arenas to define and adjudicate the spheres of public and private as well as in debates within contemporary political theory over the relationship between the individual and the community.

John Locke's political theory is a source for proponents of both individual rights and popular sovereignty, and the same tension that runs through modern liberal thought and practice can be found in his theory and interpretations of it. Long celebrated as the source of the natural rights theory that undergirds the liberal state, Locke has more recently been criticized by communitarian thinkers and others for what is described as the excessive individualism of his theory. Bellah et al. (1985, 20, 143) identify Locke as "the key figure" in the development of the modern individualist strand that is the source of the "first language" of American politics, a dominant discourse that competes with biblical and republican traditions. Sandel (1996, esp. 22-3) speaks of a similar tension in the American political tradition between a republicanism concerned with the public good and a liberal theory of rights as "trumps" derived in part from Locke. Glendon (1991) describes Locke as a source of the dominant American political language of "rights talk." A contrasting interpretation views Locke as erring in the opposite direction and criticizes him for putting all the authority in the hands of the people and not sufficiently guaranteeing the rights of minorities and individuals. "Locke had no hesitation in allowing individuals to hand over to civil society all their natural rights and powers," writes Macpherson (1962, 256), and several prominent scholars agree (see Cox 1960, 120–2; Shapiro 1986, 116, 125–6; Strauss 1953, 233). What is the locus of supreme authority in Locke?

The tension in Locke's theory between the competing claims to ultimate or "sovereign" authority is not the result of confusion but the outcome of his axiomatic doctrine of the natural freedom of the individual. Rather than define the state in terms of a single sovereign authority, Locke constructs a sovereignless commonwealth with several coexisting claimants to supreme authority: the naturally free individual, the people or society, the legislative, and the executive. Locke rejects sovereignty as what unifies the state, and he wants to replace the discourse of sovereignty theory with a language of obligation that will help bind together the sovereignless state. The political reform he contemplates requires a conceptual and linguistic reform. In the Preface to Two Treatises Locke ([1689b] 1988, 138) asks his critics to reflect that "there cannot be done a greater mischief to prince and people, than the propagating wrong notions concerning government." An adequate political language will enable governors and governed to articulate the basis and limits of political power.

By propagating correct notions concerning government Locke hopes to encourage the legitimate exercise of political power. Furthermore, as Connolly (1974, 1) reminds us, "the language of politics is not a neutral medium that conveys ideas independently formed; it is an institutionalized structure of meanings that channels political thought and action in certain directions" (see also Pitkin 1967, 1). Institutional mechanisms check and channel that power, but the political machine does not run of itself. A shared language of obligation is a centripetal force that helps the political machine work without a single ultimate authority. An understanding of Locke's sovereignless state helps us better comprehend the theoretical and practical tensions embodied in the simultaneous discourses of individual natural rights, popular sovereignty, and governmental authority heard in the liberal state.

John T. Scott is Associate Professor of Political Science, University of California Davis, Davis, CA 95616-8682.

I am grateful to the following individuals for their comments and suggestions: Jennifer Apfel, Ruth W. Grant, Donald S. Lutz, Roger D. Masters, Philip A. Michelbach, Joseph Schlichting, Vickie Sullivan, and Eduardo Velásquez. I am also grateful to the Department of Political Science and the Honors College at the University of Houston, where the work for this article was completed.

LOCKE AND SOVEREIGNTY THEORY

Locke is widely believed to be a theorist of popular sovereignty. The editor of the standard edition of the Two Treatises explains that Locke's conception of the fiduciary nature of political power "secures the sovereignty of the people," for it is the people "who decide when a breach of trust has occurred" (Laslett 1988, 115; see also Tully 1983, 4-5; Wootton 1986, 44). Franklin (1978) agrees that Locke's doctrine of popular sovereignty is expressed as the right to resistance, and Gough (1973, 46-7) states that the community, or the people, is clearly sovereign in Locke's system, even though the philosopher does not expressly say so. Simmons (1993, 159 n.) is more reluctant to interpret from Locke's silence, writing that "there is a fairly clear sense in which he takes the people (society) to be sovereign."

In fact, Locke never calls the people "sovereign." He states that "there remains still in the people a supreme power to remove or alter the legislative, when they find the legislative act contrary to the trust reposed in them." Yet, he quickly assures us that while the people are latently "supreme," they are not actively such as long as government subsists: "The community may be said in this respect to be always the supreme power, but not as considered under any form of government, because this power of the people can never take place till the government be dissolved" (II, 149). The people is "supreme" only when government is dissolved; they are subordinate to the "one supreme government" (II, 89) while it exercises legitimate power. And if the dissolution of government often or even necessarily entails the dissolution of society and returns individuals to the state of nature, as Locke sometimes seems to argue (II, 121, 205, 219; see Simmons 1993, 167-72; Strauss 1953, 232 n.), then the people are in actuality perhaps never supreme. Thus, Polin (1960, 231, 160) wants to argue that in Locke "the people always remain—in the last analysis—the supreme power," but ultimately he concedes that "Locke participates in the myth of the sovereign people that will hold sway over the entire history of modern States."

Other interpreters continue to search for a Lockean sovereign within the state. While government endures, "supreme power" resides in the legislative (II, 149). Gough (1973, 118) therefore distinguishes between the normal "legal" sovereignty of parliament and the extraordinary extralegal or "political" sovereignty of the people in Locke's theory (see also Seliger 1968, 326). Yet, Locke also admits that the executive—who possesses the right of prerogative, may share in legislative power through the veto, and wields the power of government when the legislative is not in session—"in a very tolerable sense may also be called Supreme" (II,

151). Lamprecht (1962, 149) and Seliger (1968, 327) therefore contend that Locke develops a theory of shared or divided sovereignty, whereas Weston and Greenberg (1981) find in him a theory of "co-ordination in law-making" that means effective parliamentary sovereignty.

Who, then, is "sovereign" in the Lockean commonwealth? Is it the people? The legislative? Or even the executive? Aaron (1955, 281) notes the "considerable difficulty" of answering this question: "No doubt, the proper answer to the question is that the people are sovereign," he avers, but apparently there is some doubt, since he confesses that "Locke's political theory is devoid of any clear-cut theory of sovereignty." Barker (1962, xxv-xxvi) nominates the same candidates for Lockean sovereign and then complains that the theorist is simply unclear on the point. Finally, Lamprecht (1962, 148) laments that a serious flaw in Locke's theory is "his failure to grapple with the problem of sovereignty."

Locke's Rejection of Sovereignty

Rather than fail to grapple with sovereignty, Locke tacitly rejects the concept. He intentionally avoids the term in articulating his own theory as an implicit criticism of the theory of sovereignty he confronted. In particular, Locke rejects sovereignty theory's understanding of political power as the exclusive possession of certain ultimate powers. His thought does not accommodate a traditional sovereign, and much of the disagreement over his theory arises from trying to find a sovereign where one does not exist.

When writing in his own name about legitimate political power, Locke speaks of "supreme power." He restricts the term "sovereignty" to his critique of Filmer, using it throughout the First Treatise (see Grant 1987, 74–9; Kendall 1965, 95; Lamprecht 1962, 148).² On the rare occasions in the Second Treatise when the term is used, Locke is directly or indirectly disputing Filmer ([1675] 1991). For instance, Locke (II, 69, 83; see also II, 4, 61, 108, 115) argues that fathers do not possess the "sovereign power of commanding," "dominion" over their children, or "absolute sovereignty and power of life and death" over their wives or children, for which Filmer contends. When he returns

¹ All citations are to Two Treatises of Government (Locke [1689b] 1988), by treatise and section number, unless otherwise noted. References to Essay Concerning Human Understanding (Locke [1690] 1975), hereafter Essay, are by book, chapter, and section number. Spelling and capitalization are modernized, and original italics are omitted throughout, but original punctuation and usage are maintained.

² In his mature political writings, Locke adopts the same strategy as in Two Treatises. When he speaks in his own name, as in the Letter Concerning Toleration, Locke ([1689a] 1983, 48) defines the legislative as the "supreme power." He also uses the term "civil magistrate," which he also calls "supreme" (pp. 48-9; see Two Treatises, II, 89). In his defense of this work in the 1690 Second Letter on Toleration, Locke (1823, 6: 76) follows the usage of his opponent, for example, when he speaks of "the magistrates of the world, or civil sovereigns, as you think it more proper to call them." He does the same in the 1692 Third Letter on Toleration (pp. 158 ff.). The early unpublished Tracts on Government are more difficult to categorize (see Locke [c. 1660-62] 1967, 125, 187, 212-3), and it is unclear whether Locke accepts a Bodinian or other theory of sovereignty there. The Tracts are often described as "conservative" and in conflict with the theory of the Two Treatises (see Abrams 1967, Ashcraft 1986, 88-92; Dunn 1969, chap. 2; Simmons 1993, 123-36; Tully 1983).

to the exposition of his own theory of political power, however, Locke eschews the term.

Filmer's version of sovereignty theory is the immediate target, but Locke's reasons for avoiding "sovereignty" go beyond Filmer's patriarchalism to sovereignty theory in general. Locke (I, 9) summarizes Filmer's theory of political authority near the outset of the First Treatise: "This fatherly authority then, or right of fatherhood, in our a[uthor]'s sense is a divine unalterable right of sovereignty, whereby a father or a prince hath an absolute, arbitrary, unlimited, and unlimitable power, over the lives, liberties, and estates of his children and subjects."3 Although the most prominent claim of Filmer is that sovereignty is inherited from Adam, given the difficulties of locating the rightful heir of Adam, among other problems, he ultimately contends that we can identify rightful rulers by their possession of certain "sovereign" powers as a form of "dominion" (Tarcov 1984, 9-22). For example, Filmer ([1675] 1991, 7, see 12, 55) argues that the patriarchs were sovereigns since they possessed the power of life and death and of making war and peace, which "are the chiefest marks of sovereignty that are found in any monarch." Sovereigns are recognized not by their paternity but by their power.

By defining sovereignty in terms of the possession of certain powers, Filmer self-consciously follows Bodin ([1566] 1945, [1577] 1962; see Filmer [1675] 1991, 161-4). Locke (I, 8) recognizes that debt when he points out that Filmer discusses the power of kings "in Bodin's words." The concept of sovereignty gained prominence in English political thought largely through the introduction of Bodin's theory in the late seventeenth century (Allen 1928, chap. 10; Tuck 1993, 260-2). Bodin's theory of sovereignty represents the culmination of the modern natural law theory, which supplanted medieval theories of the state (Gierke 1957, 36–7). Bodin ([1577] 1962, 84) defines "majesty" or "sovereignty" as "the most high, absolute, and perpetual power over the citizens and subjects in a commonwealth." Sovereignty is defined and identified by the possession of five powers: creating magistrates, proclaiming laws, declaring war and peace, receiving final appeals, and wielding the power of life and death (Bodin [1566] 1945, 172-3). The sovereign is absolute and not subject to any (human) law and is the sole judge, not only of the civil law he himself makes but also even of the natural law by which he is bound and by which his own actions are to be judged. Finally, Bodin ([1577] 1962, 91-3) strenuously argues that sovereign power is indivisible. This notion caused perhaps the greatest difficulty when it was grafted onto English constitutional thought and its traditional, although highly contested, conception of shared or divided powers.4 Bodin's sovereignty theory was viewed by many, including Coke, as foreign to English constitutionalism (Burgess 1992, 165–6, 196–8). Nonetheless, the concept of sovereignty became increasingly common in the debates over political power from the Civil War to the Glorious Revolution, a period Locke ([1703] 1997b, 351–2) identifies as one in which the question of "the rise and extent of political power" had been "so bandied amongst us."

Locke's political theory has been widely interpreted as in part a reaction to the debate over the locus in sovereignty, but confusion about his position arises largely from trying to read him in terms of the sovereignty theory he rejects. Figgis (1896, 240) points in the right direction: "Locke's treatise is expressly directed against the notion that there is any sovereign power in the state.... The more closely Locke's treatise is studied, the more clearly it will be seen that it is an attack directed far more against the idea of sovereignty than against the claims of monarchy." Yet, Locke does not "expressly" argue against sovereignty. He makes a tacit argument. We must begin from his silence.

Several scholars have attempted to interpret Locke's silence and conclude that he avoids the term "sovereignty" because of its Hobbesian association, but contradictory interpretations have been offered about his avoidance of the term. Numerous writers in the midseventeenth century either contended against the Leviathan or avoided the dangers that came from referring to Hobbes or using his terminology (Ashcraft 1986, esp. 570-1; Kenyon 1977, 16-7). Although Locke does not directly discuss Hobbes,5 there is at least an indirect link to his discussion of sovereignty, since Filmer examines Hobbes's theory at length in a writing to which Locke (I, 14) refers as containing the sum of Filmer's argument "for Adam's sovereignty, and against natural freedom." Filmer ([1675] 1991, 184, and see 191-4) criticizes Hobbes's argument for sovereignty from consent but has no objection to his absolutism, prefacing his observations on Hobbes's theory by commenting that he read his works "with no small content, ... consenting with him about the rights of exercising government."6

We know that Locke does not consent with Filmer about the origin or rights of political power, but his relation to Hobbes is less clear. On the one hand, Gough (1973, 47) argues that Locke establishes the sovereignty of the people and explains that he does not actually call the people "sovereign" in order to steer clear of Hobbes. On the other hand, Cox (1960, 108–10, 120) contends that the individual is as wholly

³ In his early "An Essay on Toleration," Locke ([1667] 1997a, 135–6) describes the claim to monarchy by divine right in similar terms: "that the sole, supreme, arbitrary power and disposal of all things is and ought to be by divine right in a single person."

⁴ Bodin ([1577] 1962, 96-8) argues that the monarch is the sole sovereign in the English system. His theory was initially used in England by the royalists (see Tuck 1993, 260-2).

⁵ Locke (II, 98) appears to allude to Hobbes when he writes that the requirement of unanimity "would make the *mighty Levlathan* of shorter duration, than the feeblest creatures." Hobbes ([1651] 1994b, 210) explains his use of "leviathan" just before claiming that a properly designed state could be immortal. Compare Laslett 1988, 71. Locke also refers to Hobbes and his Leviathan in the *Ersay* (I.3.5). I will return to Locke's rejection of sovereignty in an apparently Hobbesian version when I discuss the contrast he makes between the state of nature and state of war.

⁶ Bodin is a source of the sovereignty theory of both Filmer and Hobbes. Hobbes ([1650] 1994a, 166-8; [1651] 1994b, 115-6) enumerates basically the same powers of sovereignty as Bodin and explicitly follows him in arguing against its divisibility.

absorbed into the sovereign state in Locke's theory as in that of Hobbes, and he therefore conjectures that Locke avoids the term because he is in fact a Hobbesian. In contrast, Vaughn (1925, vol. 1, 134) agrees that Locke's abstention is in part a reaction to Hobbes, but, like Figgis, he contends that his work is "in fact, an assault not only upon the sovereignty of *Leviathan*, but upon the very idea of sovereignty.... At bottom, he is as much against the 'sovereignty of the people' as against that of the oligarchy or the tyrant."

Examination of what Locke does say about sovereignty reveals why he rejects the concept in any of its versions. His break with the core idea of sovereignty theory, that sovereignty is defined and identified by the exclusive possession of certain ultimate powers, can be seen in a passage in the First Treatise in which he juxtaposes the terms "sovereignty" and "supreme power" in a way that Cox (1960, 109) takes to indicate their synonymy. Against Filmer's contention that political authorities are recognized by their possession of the "absolute and sovereign authority" of life and death and other powers, Locke (I, 129) argues that the possession of such powers "is not a certain mark of sovereignty." In the passage in question, he takes up the claim that the possession of the power of war and peace is an unerring "mark" of sovereignty in a way that undercuts the entire theory of sovereignty.

But making war and peace are marks of sovereignty. Let it be so in politic societies. May not therefore a man in the West-Indies... make war and peace... without being a sovereign, an absolute king over those who went with him?... War and peace cannot be made for politic societies, but by the supreme power of such societies.... In voluntary societies for the time, he that has such a power by consent, may make war and peace, and so may a single man for himself, the state of war not consisting in the number of partisans, but the enmity of the parties, where they have no superior to appeal to (I, 131; emphasis added).

At first glance, Locke may appear to use "sovereign" and "supreme power" interchangeably. He does indeed attribute to the "supreme power" of his positive theory some of the same powers traditionally ascribed to a "sovereign," the most important of which is the power of life and death (see II, 90, 93, 139). Even his stipulated definition of "political power" is phrased in terms of that power: "Political power then I take to be a right of making laws with penalties of death, and consequently of all less penalties" (Π , 3). Along with Cox, Seliger (1968, 326) concludes that in Locke's "usage, 'supreme power' means exactly the same as 'sovereign power.' He did not shun the term 'sovereignty." Laslett reaches a similar conclusion (see editor's notes to Locke [1689b] 1988: I, 129, 131; II, 11, 88). Yet, closer examination reveals that Locke himself shuns the term. In the passage in question, as elsewhere, he uses "sovereignty" solely when repeating Filmer's argument, and he uses "supreme power" when speaking in his own name. The purport of his change in usage in the above passage is intimated by his pairing of "sovereign" and "absolute king" in the Filmerian sentence and "supreme power" and "politic societies"

in the Lockean statement. Filmer's "sovereign" or "absolute king" has "an absolute, arbitrary, unlimited, and unlimitable power" as "lord or proprietor of every thing" (I, 9). In contrast, Locke's "supreme power" holds power in trust from a "politic society" based on "consent."

Although Locke allows that the supreme power exercises powers traditionally ascribed to the sovereign, he points to a completely different basis for that power, one which will limit it and make it reasonable. He argues against Filmer that the powers of life and death and of war and peace, and other powers understood as the exclusive possession of sovereigns, are exercised by inferior magistrates and others (I, 129-31). More important, he claims that these powers are rightly exercised by individuals. Not only may a man in the West Indies make war and peace without being a political authority, but also "so may a single man for himself" exercise the powers of war and peace where he has "no superior to appeal to" (I, 131). Locke attacks sovereignty theory at its root: "The actual making of war or peace is no proof of any other power...and this power in many cases any one may have without any politic supremacy" (I, 132). All individuals possess "sovereign" powers where there is no recognized supreme power. Locke's switch of terms represents a different conception of the very nature and basis of political authority.

The "Sovereign" Individual

Locke rejects the traditional sovereign because for him political power derives from the rights and powers of naturally free individuals who cannot reasonably be conceived to have relinquished their rights to a sovereign. "To understand political power right, and derive it from its original, we must consider what state all men are naturally in" $(\Pi, 4)$. The state of nature reveals the moral autonomy of the individual. The natural state of mankind is "a state of perfect freedom" and also a state of equality, "wherein all the power and jurisdiction is reciprocal" (Π , 4; see Π , 54). Locke suggests his rejection of traditional sovereignty in this context when he claims it is evident that individuals are equally born "without subordination or subjection" unless there is a manifest declaration by "the Lord and master of them all" that one person has "an undoubted right to dominion and sovereignty" (II, 4). No earthly being possesses exclusive dominion and sovereignty by nature; thus, everyone possesses reciprocal power and jurisdiction. If the individual possesses "sovereign"

⁷ Locke's explanation in the First Treatise for why "War and peace cannot be made for politick societies, but by the supreme power of such societies" foreshadows his argument that the supreme power of a political society is the majority or its representative: "because war and peace, giving a different motion to the force of such a politic body, none can make war or peace, but that which has the direction of the force of the whole body, and that in politic societies is only the supreme power" (I, 131). In the Second Treatise, Locke describes the majority as the "greater force" that moves the political "body" (II, 96)

powers by nature, then there is no "sovereign" in the traditional sense.

Locke's most radical break from sovereignty theory is to argue that individuals by nature possess the powers of judging and executing the law of naturepowers traditionally ascribed to the sovereign alone. By nature individuals have a right to self-preservation and a right to preserve all mankind (II, 6). Invasions of those rights are contrary to the law of nature, and Locke maintains there must be an executor of the law of nature lest that law "be in vain." Since "naturally there is no superiority or jurisdiction of one, over another," he argues that "every one has a right to punish the transgressors of that law to such a degree, as may hinder its violation" (Π , 7). Every individual is the ultimate judge of when to execute the law of nature and to what degree, even with death (II, 12). When entertaining the objection that "it is unreasonable for men to be judges in their own cases," Locke admits the inconvenience but reiterates his position that every individual has "liberty to be judge in his own case" $(\Pi, 13).$

The right to exercise the natural power to judge and execute is based on the "property" Locke states every individual has in his person: "Every man has a property in his own person. This no body has any right to but himself" (Π , 27; see Π , 173). With the right comes power. The individual has "by nature a power, not only to preserve his property, that is, his life, liberty and estate, against the injuries and attempts of other men; but to judge of, and punish the breaches of that law in others" (II, 87). The same conclusion concerning the ultimate right of the individual to judge follows from Locke's argument that human beings are God's property: "For men being all the workmanship of one omnipotent and infinitely wise maker; all the servants of one sovereign master, sent into the world by his order and about his business, they are all his property whose workmanship they are, made to last during his, not one another's pleasure" (II, 6; see I, 39). How Locke can maintain simultaneously that individuals have a property in their persons and that God owns that property is unclear, and some scholars maintain that the "workmanship argument" precludes a doctrine of inalienable rights (Glenn 1984, 80-2; Kendall 1965, 68; Polin 1960, 211; Simmons 1993, 109). Perhaps Locke's position on the ultimate right to judge is derived from both his divine workmanship argument and his consideration of the natural right to selfpreservation (Grant 1987, 66–72). Whether or not God is considered as our "sovereign master," no one possesses by nature an "undoubted right to dominion and sovereignty" over others (II, 4). In either case, Locke directs his argument against sovereignty theory.

The doctrine of rights as property in one's person further undermines sovereignty theory by reconfiguring the relationship between property rights and political power. In sovereignty theory, political power is viewed as a form of property. As Locke explains in the *First Treatise*, the tradition of primogeniture reinforces the mistaken opinion of the inheritance of "both estate and power; and that the inheritance of both rule over men

and property in things, sprang from the same original" (I, 91; Resnick 1992, 110). Locke's opposing argument about individuals having property in their person depends upon a distinction between transferable and nontransferable property that he uses to defeat both Filmer's patriarchalism and sovereignty theory more generally. "Locke's positive argument in the Second Treatise also turns on what kinds of rights and powers are transferable and by what means, rather than on the traditional catalog of powers considered to be marks of sovereignty" (Grant 1988, 58; see also Glenn 1984, esp. 94-5). Neither paternal nor political power is a form of property, Locke argues: "A father cannot alien[ate] the power he has over his child" (I, 100), and he cannot transfer any political power he may have through inheritance or otherwise (I, 93). The basis of all political authority is consent, not inheritance (I, 94). If individuals possess their rights as property in their persons, then all political power must be derived from the natural power of the individual and held through consent and in trust (see Π , 127–8).

In entering civil society, the individual agrees to "give up" a portion of his natural powers. The power of acting for the preservation of self and of mankind "he gives up to be regulated by the laws made by the society, so far forth as the preservation of himself, and the rest of that society shall require" (II, 129). The natural executive power of punishing infractions of the law of nature "he wholly gives up" (II, 130). Locke uses "gives up" in the sense of renouncing the exercise of a power and yielding to someone else (see Oxford English Dictionary, s.v. "give up"). The underlying power cannot be transferred or alienated. "For no man, or society of men, having a power to deliver up their preservation, or consequently the means of it, to the absolute will and arbitrary dominion of another . . . they will always have a right to preserve what they have not a power to part with; and to rid themselves of those who invade this fundamental, sacred, and unalterable law of selfpreservation" (II, 149; emphasis added). The ultimate right to judge and execute is what we would term an inalienable right.8 "This freedom from absolute, arbitrary power, is so necessary to and closely joined with a man's preservation, that he cannot part with it, but by what forfeits his preservation and life together" (II, 23). The right of the individual to judge the "supreme power" of government ensures that the individual remains "sovereign."

The theory of the natural authority of the individual "will seem a very strange doctrine to some men" (II, 9), Locke admits. And indeed it is. Although he claims to recur to "the old way" of making governments "by contrivance, and the consent of men" (I, 4, 6), his theory of the natural powers of the individual is a break from previous consent theory in both its English con-

The attribution of a doctrine of "inalienable" rights to Locke is problematic, in part because he does not use the term in his political theory (Glenn 1984, 80-2; Kendall 1965, 68; Polin 1960, 211; Simmons 1993, 109). Nonetheless, based on what he does argue, Locke must at least be committed to the position that individuals cannot alienate the right to judge when their trust is violated and to resume the exercise of their natural powers.

stitutionalist and natural law versions (see Ashcraft 1986; Höpfl and Thompson 1979; Pocock 1957; Resnick 1984; Zuckert 1994, esp. 64-5). In both versions, political power was conceived as originating in a compact between the people and the ruler, the ruler and his heirs then held perpetual authority over his subjects and their descendants (see Gierke 1957, 44-61; Kantorowicz 1957, esp. 223-31). Where an active right by the people to resist tyranny was admitted, for example, in the populist tract Vindiciae contra tyrannos, it was held to belong to the representatives of the people and not the people itself (Mornay [?] [1579] 1969, 189ff.). Lawson was the most prominent theorist prior to Locke to find in the people a right to resist, and Franklin (1978) argues that Locke follows Lawson (see also Skinner 1978, 247-8, 338-9). Yet, Locke takes a decisive step beyond Lawson by arguing that not only the people but also every individual possesses the right to resist.

Locke ultimately grounds the right to resist on the individual's right to exercise the natural powers of judgment and execution. He frames his doctrine of resistance in answer to the "old question... But who shall be judge?" posed by Hunton, a defender of monarchical sovereignty who preached passive resistance for want of an earthly judge above the sovereign (see Hunton [1643] 1986, 187–8). The first time Locke poses Hunton's question he answers in his own name: "Of that I my self can only be judge in my own conscience" (Π , 21). We glimpse here the revolutionary Locke revealed by Ashcraft's (1986) biography. "And where the body of the people, or any single man, is deprived of their right . . . and have no appeal on earth. there they have a liberty to appeal to heaven, whenever they judge the cause of sufficient moment" (II, 168; emphasis added). The right to resist "is an inalienable right; without it a man would be a slave subject to absolute power" (Grant 1987, 173; see also Andrew 1988; Glenn 1984).

Locke's reason for usually speaking of popular instead of individual resistance has more to do with prudence than right. Thus, although he insists upon the right of an individual or a minority to resist a majority they judge to be unjust, he admits that they may not act because the exercise of their right is not likely to succeed "where the body of the people do not think themselves concerned in it" (II, 208). Resistance is more likely to occur when the mischiefs of illegitimate power "have extended to the majority of the people" or at least threaten everyone (Π , 209; see Π , 223–6, 242), that is, when it becomes reasonably prudent to act upon that right. Locke's doctrine that the powers of judging and executing the law of nature ultimately reside in the individual distinguishes his theory from even his most radical predecessors. William Penn foresaw the implication of such a theory when he wrote during the exclusion crisis of the fundamental "right and title to your own lives, liberties, and estates: in this every man is a sort of little Sovereign to himself" (quoted in Ashcraft 1986, 208).

THE SOVEREIGNLESS STATE

The sovereignless state of nature produces a sovereignless state. Rather than speak in terms of an ultimate, absolute, and incorrigible sovereign, Locke organizes the civil state so that several claimants to ultimate power can coexist without a common authority in theoretical harmony, if in practical tension. These claimants are the same candidates that Locke's interpreters have nominated for sovereign: the naturally free individual, society or the people, the legislative, and the executive. Yet, none of them are sovereign in the traditional sense of being a single, absolute, and incorrigible authority; they are contingently "supreme" in possessing power that is continually open to judgment in terms of its reasonableness for the naturally free individuals who consent to join society and entrust it with their power. Locke's conceptual vocabulary of the legal or moral conditions in which individuals can understand their relations to one another provides the means for the theoretical coexistence of several supreme powers and the simultaneous affirmation of the ultimate "sovereignty" of the individual and the supremacy of society and its government. The legal conditions Locke stipulates—the state of nature, state of war, and civil society—are not static denominators of sovereign rulers and their subjects; they are contextual and corrigible relationships among claimants to supreme authority. Each of the potentially supreme powers within the sovereignless state can be judged to be supreme according to the context and can be considered differently as the context changes. Before turning to the language of obligation that Locke provides for making such judgments, I will explore the legal vocabulary he offers to allow the theoretical coexistence of supreme powers and the structure of the sovereignless state.

The State of Nature and Civil Society

In order to understand how a sovereignless state with coexisting claims to supreme power is theoretically possible, one must grasp the primary legal and relational character of Locke's terms, especially the "state of nature" and "civil society." The three conditions Locke identifies are relational conditions defined by the legal or moral relations between two or more individuals or groups. The transition from one condition to another is likewise a change in legal or moral relationships. The tendency to interpret Locke's discussion of the move from the state of nature into civil society in particular as a historical or temporal change (e.g., Wolin 1961, 306) has obscured the primary relational character of his terms and their bearing on the structure of the Lockean commonwealth.

The relational character of the legal conditions Locke identifies has been noted by several scholars (e.g., Ashcraft 1968, 904–5; Dunn 1969, 111) but is explored most thoroughly by Simmons (1993, esp. 16–7). As Simmons notes, an individual can be in two or even all three states simultaneously in relation to different individuals. For example, Locke speaks of a

member of a commonwealth who is being robbed as being in a state of war in relation to the robber but remaining in civil society in relation to his fellow citizens (II, 18). He states that all members of a community remain in civil society in relation to one another while being in a state of war in relation to a tyrannical executive or legislative (II, 211–2, 222). Finally, his own example as proof against those who ask about the existence of a state of nature confirms the primary relational character of both civil society and the state of nature: Independent political communities, whose own members are in civil society with one another, are in a state of nature in relation to each other (II, 14; see II, 145, 183).9

The state of nature and civil society are distinguished by the absence or presence of a recognized common judge between individuals. The primary relational character of the state of nature is brought out by Locke's stipulated definition: "Men living together according to reason, without a common superior on earth, with authority to judge between them, is properly the state of nature" (Π , 19). The state of nature is "properly" a transhistorical moral or legal concept that defines the relationship among any individuals or groups without a recognized terrestrial superior. Naturally free and independent individuals leave the state of nature and put themselves into civil society in order to avoid a condition in which the only appeal is to heaven and in which differences are therefore apt to lead to a state of war (II, 21). A civil society is created when individuals agree to "make one people, one body politic under one supreme government" by establishing a common terrestrial superior (Π , 89).

A common judge is established when individuals give up the exercise of their natural powers of judgment and execution. "Wherever therefore any number of men are so united into one society, as to quit every one his executive power of the law of nature, and to resign it to the public, there and there only is a political, or civil society" (II, 89; see II, 87). A recognized common judge is the definitive difference between civil society and the state of nature. "Whereby it is easy to discern who are, and who are not, in political society together. Those who are united into one body, and have a common established law and judicature to appeal to, with authority to decide controversies between them, and punish offenders, are in civil society one with another: but those who have no such common appeal, I mean on earth, are still in the state of nature, each being, where there is no other, judge for himself, and executioner; which is, as I have before showed it, the perfect state of nature" (II, 87). The relational character of both civil society and the state of nature is clear here. Individuals are in civil society "one with another" when they have a common law and judge to which they can appeal. Those who have no such common terrestrial appeal are "still" in the state of nature in relation to one another.

Locke appears to draw an absolute distinction between civil society and the state of nature, but the relational character of his terms means that they are not as exclusive as he initially implies. Aside from the "perfect" state of nature wholly lacking any political associations and thus any common judge, there are less "perfect" examples. "And wherever there are any number of men, however associated, that have no such decisive power to appeal to, there they are still in the state of nature" (II, 89; see also II, 91). A state of nature exists where there is no decisive common judge among "any number of men, however associated." The state of nature may conceivably be "perfect," that is, perfectly devoid of any ultimate authority; but every human association—including the commonwealth—is necessary "imperfect," since Locke rejects sovereignty.

The absence of a single common authority might even seem to make civil society indistinguishable from the state of nature. Locke in fact takes up this issue.

No man in civil society can be exempted from the laws of it. For if any man may do, what he thinks fit, and there be no appeal on earth, for redress . . . I ask, whether he be not perfectly still in the state of nature, and so can be no part or member of that civil society: unless any one will say, the state of nature and civil society are one and the same thing, which I have never yet found any one so great a patron of anarchy as to affirm (II, 94).

Does Locke make so bold? No. The civil state is not a state of nature, but because of their relational character the two conditions are not mutually exclusive (see Pangle 1988, 248; cf. Ashcraft 1968, 914). As Locke admits in granting the possibility that government abuses its authority: "This is an inconvenience, I confess, that attends all governments whatsoever" (II, 209). He evokes the "inconveniences" of the state of nature and admits that they endure in the commonwealth. The state of nature necessarily remains a constant legal possibility where there is no single sovereign authority.

The Coexistence of Supreme Powers in the Sovereignless State

The Lockean state contains several claimants to supreme power that coexist without any sovereign judge among them. Locke explains that the supreme political power of a commonwealth is initially exercised by the society as a whole, through majority rule (II, 96–9). Civil society or the people itself is therefore supreme in this sense as the original legislative power. He observes, however, that the legislative power is usually entrusted to a separate governmental body that then holds the "supreme power" (II, 132, 134). He insists several times upon the irrevocable nature of this transfer of supreme power to the legislative (e.g., II, 243). Yet, he also says that the people simultaneously retain supreme power in some regard: Although "there can

⁹ Although he has been interpreted in this way, what Locke actually writes is that "since all princes and rulers of independent governments all through the world, are in a state of nature, 'tis plain the world never was, nor ever will be, without numbers of men in that state' (II, 14). He therefore only asserts that rulers are in the state of nature, but he does not specify what sort of rulers (existing "princes" or legitimate executives?), and he does not specify with whom they are in this relationship (their fellow rulers or everyone, including the members of their own state?).

be but one supreme power, which is the legislative, to which all the rest are and must be subordinate, yet the legislative being only a fiduciary power to act for certain ends, there remains still in the people a supreme power to remove or alter the legislative, when they find the legislative act contrary to the trust reposed in them" (II, 149).

well-constituted commonwealths, legislative power is put into the hands of individuals who assemble periodically and "when they have done, being separated again, they are themselves subject to the laws, they have made" (II, 143-4). Even so, when they are exercising this power, the representatives are not then subject to the laws they make, and there is thus no common judge between the legislative and the people at that point or, indeed, ever. The coexistence of these two supreme powers has led some scholars to distinguish between the normal "legal" sovereignty of parliament and the "political" sovereignty of the people in Locke's theory or to put forward similar interpretations of divided, coordinated, or shared sovereignty. Yet, the people and the legislative in Locke's theory are "supreme," not "sovereign." Each power might be recognized by the other as its superior in certain situations, and the smooth functioning of the Lockean commonwealth requires such recognition. Where that recognition is not granted, a common superior cannot be said

The same relationship of uneasy coexistence with its fellow supreme powers exists for the executive in the Lockean state. In well-constituted commonwealths, legislative and executive power are separated. Although executive power is subordinate to the supreme legislative power, since the legislative power is not always in being but the executive power must be, the executive "in a very tolerable sense may also be called supreme." Furthermore, if the executive also shares in legislative power through the veto, for example, "he is properly enough in this sense supreme" (II, 151). Finally, the power of prerogative possessed by the executive makes him "supreme" in another, more radical sense. "This power to act according to discretion, for the public good, without the prescription of the law, and sometimes even against it, is that which is called prerogative" (II, 160). Since the executive is above the law and is in a sense outside the society and wields the executive power of the law of nature (II, 159), he must be said to hold the "supreme power" in this sense as well.

Locke's most revealing remarks concerning the tension among the supreme powers of the commonwealth come in his discussion of executive prerogative. "The old question will be asked in this matter of prerogative, but who shall be judge when this power is made a right use of? I answer: between an executive power in being, with such a prerogative, and a legislative that depends upon his will for their convening, there can be no judge on earth" (II, 168). The difficulty is not limited to executive prerogative, however, and extends to the structure of the commonwealth as a whole: "As there can be none, between the legislative, and the people, should either the executive, or the legislative, when

they have got the power in their hands, design, or go about to enslave, or destroy them. The people have no other remedy in this, as in all other cases where they have no judge on earth, but to appeal to heaven" (II, 168). Locke avows this consequence in Letter Concerning Toleration ([1689a] 1983, 49): "For there is no judge upon earth between the supreme magistrate and the people. God, I say, is the only judge in this case." He adds demurely: "I only know what actually happens where controversies arise, without a judge to determine them." The specter of the state of nature is not limited to the outbreak of a state of war; the lack of appeal which is discovered with the judgment that tyranny exists merely reveals there was never any judge on earth among these parties. The state of nature endures as a necessary possibility, and the state of war looms as a constant threat for the Lockean commonwealth.

The State of Nature and State of War

The distinction Locke draws between the state of nature and the state of war allows him to create a sovereignless state wherein the absence of a common judge among the claimants to supreme power need not necessarily be a condition of war. Against those who have confounded the state of nature and state of war, apparently Hobbes, Locke insists that the two states must be distinguished. "Men living together according to reason, without a common superior on earth, with authority to judge between them, is properly the state of nature. But force, or a declared design of force upon the person of another, where there is no common superior on earth to appeal to for relief, is the state of war" (II, 19). Like the state of nature, the state of war is a relational term that defines the legal or moral relationship between individuals where there is no common terrestrial appeal. The state of war therefore can be understood as a subset of the state of nature (see II, 90-1, 93-4; Simmons 1993; Tarcov 1981, 202; cf. Ashcraft 1968; Dunn 1969, 180-1). What distinguishes the two conditions is the use of unauthorized force: an individual "using force, where he has no right" (II, 18; see II, 181, 207, 227, 232). This is precisely the point Locke makes immediately before stating: "And here we have the plain difference between the state of nature, and the state of war" (II, 19, emphasis added; Ashcraft 1968, 904).

Most interpreters miss the relevance of the distinction Locke draws between the state of war and state of nature because they either deny the distinction or misunderstand it. Despite Locke's explicit statement, Strauss (1953, 224–30) denies that there is ultimately a distinction between the two conditions; he argues that Locke gradually reveals the irenic natural condition to be a Hobbesian war of all against all (see also Cox 1960, esp. 75–9; Pangle 1988, 244–51). Alternatively, Ashcraft (1968, 900–8) argues that Locke's description of the state of nature as "men living together according to reason, without a common superior on earth" (II, 19) is meant to prove that humans are capable of living in peace (see also McClure 1996; Wolin 1961, 306–7). Yet, living "according to reason" means living without

any other rule than the law of reason of nature, that is, without a common authority, which is Locke's explicit definition of the state of nature (see Tarcov 1981, 202-4). Individuals living without a common superior may or may not act reasonably. In the state of nature, the "inconveniences" that arise when naturally autonomous individuals exercise their "sovereign" powers with the partiality of self-love make a common authority necessary (II, 13; see II, 123). As for civil society, the distinction Locke draws between the state of nature and state of war allows the possibility of the peaceful coexistence of supreme powers within the state.

Comparison with Hobbes further illuminates Locke's attempt to construct a sovereignless state in which several supreme powers can coexist. Like Locke, Hobbes defines the natural condition of mankind as a legal condition of naturally free human beings without a common terrestrial superior. But unlike Locke, for Hobbes ([1651] 1994b, 75-7, 106) the natural condition is equally a descriptive account of human nature: an "inference made from the passions," a condition that "is necessarily consequent . . . to the natural passions of men, when there is no visible power to keep them in awe" (see Pangle 1988, 246). Hobbes's natural condition of mankind is a war of all against all in both the legal and descriptive senses. This dual role of the state of nature in Hobbes's theory poses a problem for his theory of the state, since Hobbes's sovereign remains in a state of nature in relation to his subjects. Hobbes ([1651] 1994b, 111) explains that there is no contract between the sovereign and the subjects, because the sovereign legislator and judge cannot be subject to the rule of justice and injustice he provides through law, and also because a terrestrial judge above the sovereign and subject would entail an infinite regress of sovereigns. But if the state of nature is equally a description of human nature, then how can the relationship between sovereign and subject not be one of war? Hobbes (p. 120) argues that the sovereign will be restrained from violence because it is in his interest to promote the good of the appeal. He ultimately acknowledges the "incommodities" of his absolute sovereign, however, and answers with the trump card of civil war (p. 117).

Locke calls the Hobbesian bluff: "Absolute monarchs are but men, and if government is to be the remedy of those evils, which necessarily follow from men's being judges in their own cases, and the state of nature is therefore not to be endured, I desire to know what kind of government that is, and how much better it is than the state of nature, where one man commanding a multitude has the liberty to be judge in his own case" (II, 13; see II, 93)? In Locke's view, a Hobbesian sovereign is in not merely a state of nature, but is in a state of war in relation to his subjects (II, 222; see II, 91, 176, 181, 207, 227). Naturally free and rational individuals "cannot be supposed" to agree to such "an absolute arbitrary power" (II, 127). Locke's distinction between the state of nature and state of war permits, at least in theory, the peaceful coexistence between government and society, and Locke thereby aims at Hobbes's goal of peace with arguably more theoretical consistency than Hobbes himself.

Finally, we may wonder whether Locke's sovereignless state is not a more logical conclusion from the doctrine of individual natural rights than is Hobbes's attempt to erect the sovereign upon a natural rights foundation. Filmer was among the first to point to this difficulty. Hobbes wants to retain and even strengthen the sovereignty of Bodin, but beginning with the natural authority of the individual does not produce a truly absolute sovereign, given Hobbes's ([1651] 1994b, 144) assertion of inalienable rights and his admission of the right to revolt when the subjects judge that the sovereign power is effectively dissolved. Hobbes's sovereign is in this respect not the single ultimate judge that sovereignty theory seems to demand, including his own, untraditional, version. Locke does not attempt to erect a single, absolute political authority and instead articulates a sovereignless state that permits several simultaneous claimants to supreme power and continued recognition of the natural rights of the individual.

The Tensions in the Sovereignless State

Locke's relational vocabulary permits the theoretical coexistence of several claimants to supreme authority, but jettisoning sovereign authority leaves a practical tension. Vaughn (1925, vol. 1, 133, 171, 193-4) complains that a sovereign who "is not absolute, a sovereign which can only claim second honors, is, in the strictest sense, no sovereign at all." He worries that "the sovereignty of the individual" makes the Lockean commonwealth an unstable aggregation of individuals instead of a true corporate body. Vaughn seeks the sovereign authority Locke rejects, but he does leave one asking what binds together and stabilizes the Lockean commonwealth.

Grant (1988, 75–6) suggests that Locke replaces the sovereignty of a ruler with the sovereignty of law. Locke (II, 3) defines political power as the right to make and execute laws for the public good of a civil society, and he insists on the rule of standing law (II, 87, 94, 131, 136, 142). Civil society is therefore characterized by the legitimate exercise of power through law, whereas the illegitimate exercise of power is tyranny, which occurs when a governor makes "not the law, but his will, the rule" (II, 199). When the members of the commonwealth judge that the law is made and executed for the public good and when governors as well as governed consider themselves bound by the law, then there can be said to be a common judge—the law. Nonetheless, there must be a maker and executor of the law. Although Locke counsels representative government in which the legislators become subject to the laws they have made once the assembly is dissolved (II, 138), in the act of legislating they are strictly speaking not bound by the law, nor is the executive, at least in his use of prerogative. More important, the sovereignty of law depends upon the judgment of its legitimacy by governors and governed alike. The legitimacy and stability of the Lockean state requires a shared conception of the basis and limits of political power.

THE LANGUAGE OF OBLIGATION

A shared language of obligation is a centripetal force that helps the political machine work in practice despite the tension of numerous claimants to supreme authority. Locke offers an alternative political language as a replacement for sovereignty theory, especially in its divine right version, and for the political discourse of his time more generally. In the Preface to Two Treatises he explains "there cannot be done a greater mischief to prince and people, than the propagating [of] wrong notions concerning government." Although Filmer's doctrine is "glib nonsense put together in well sounding English," it is nonetheless dangerous nonsense since "the pulpit, of late years, publicly owning his doctrine" has "made it the current divinity of the times" (Locke [1689b] 1988, 137-8). Locke means to reform the political vocabulary of his time, correcting mistaken notions and propagating a more reasonable alternative.

Linguistic Reform and Political Reform

Replacing mistaken notions concerning government entails a conceptual or linguistic reform. Locke's project in the Essay ([1690] 1975) is to labor on existing philosophical ideas and language to make them more adequate, but that reform extends to political and moral issues as well. In the Essay, Locke argues that a common language is "the great bond that holds society together." In the Second Treatise, he defines a political community in terms of a common political authority (II, 212). A political society is therefore defined ideally, at least—by a common authority and by common notions concerning political authority. Languages are "proportioned to the notions men have," and Locke observes that those notions and the language used to express them vary from nation to nation (Essay II.28.2, III.5.8); furthermore, languages change with changing notions (Essay II.2.7). The replacement of mistaken notions of government with correct notions that Locke hopes to achieve through his Two Treatises is an extension of his project in the Essay.

The connection between linguistic and political reform is suggested by parallels between the Second Treatise and the Essay. Chapter 7 of the Second Treatise begins with a discussion of natural sociability and the limitations of the associations that arise "naturally."

God having made man such a creature, that, in his own judgment, it was not good for him to be alone, put him under strong obligation of necessity, convenience, and inclination to drive him into society, as well as fitted him with understanding and language to continue and enjoy it. The first society was between man and wife, which gave beginning to that between parents and children; to which, in time, that between master and servant came to be added: And though all these might, and commonly did meet together, and make up but one family, ... each of these, or all together came short of political society, as we shall see, if we consider the different ends, ties, and bounds of each of these (II, 77).

Locke indicates a link between natural sociability and the capacity for reason and language, and his discussion in the *Essay* of this capacity and its shortcomings is strikingly similar:

God having designed man for a sociable creature, made him not only with an inclination, and under a necessity to have fellowship with those of his own kind; but furnished him also with language, which was to be the great instrument, and common tie of society. Man therefore had by nature his organs so fashioned, as to be fit to frame articulate sounds, which we call words. But this was not enough to produce language (III.1.1).

Both political society and language have a natural basis, but that basis is limited and fallible; both society and language must be supplemented by human conventions (compare Tully 1980, 48–9). The chapters in the *Treatise* and the *Essay* that immediately follow the two chapters cited above establish this point in a parallel manner. Chapter 8 of the *Treatise* begins:

Men being, as has been said, by nature, all free, equal and independent, no one can be put out of this estate, and subjected to the political power of another, without his own consent. The only way whereby any one divests himself of his natural liberty, and puts on the bonds of civil society is by agreeing with other men to join and unite into a community (II, 95).

Locke argues in the *Essay* that a linguistic community is likewise established through voluntary agreement:

Man, though he have a great variety of thoughts... yet they are all within his own breast, invisible, and hidden from others, nor can of themselves be made to appear. The comfort, and advantage of society, not being to be had without communication of thoughts, it was necessary that man should find out some external sensible signs, whereby those invisible ideas, which his thoughts are made up of, might be made known to others.... Thus we may conceive how words, which were by nature so well adapted to that purpose, come to be made use of by men, as the signs of their ideas; not by any natural connection... but by a voluntary imposition (III.2.1).

Human contrivance must reform the fallible social and linguistic endowments of nature.

Locke's philosophical reform in the Essay provides a framework in which to understand his reformation of political language in the Two Treatises. The natural capacity for speech requires convention, the "voluntary imposition" of words that serve as signs of our ideas, for it to be of any utility. Because there are no innate ideas and no natural correspondence between the objects of our experience and our ideas, or between those ideas and the words we use to express them, human understanding and language are liable to imperfection. Humans often have inadequate or mistaken ideas, misuse the words that stand for them, or mistakenly assume that others agree about the significance of the words. Particularly subject to imperfection and abuse are the "complex ideas" and "general words" that stand for them from which "arise the obligations

¹⁰ A detailed comparison of Locke to Aristotle concerning the relationship between language and sociability and the roles of nature and artifice in the rise of political society would be highly instructive but goes beyond the scope of this article. Compare generally Locke, I, 98, II.2, 77–89, 169–74, to Aristotle, *Politics*, I 1–2.1252a1–1253a39 (1985, 35–8).

and several duties amongst men" (Essay II.28.2). Unlike "simple ideas," which refer to an external object (the "archetype") and are therefore less liable to abuse or easier to amend, "complex ideas" have no immediate referent and are themselves "archetypes" (Essay III.5.3). Since these ideas exist only in the mind, it is easy for an individual to assume that others attach the same meaning to the "general words" that stand for them (Essay II.28.19; see II.32.5, 9–12; III.2.4; III.9.6).

Moral and political language is thus particularly liable to be confused, inadequate, and even fantastical. Locke nonetheless finds the remedy for the disease of moral and political language in its very cause. The complex ideas of relations are "the workmanship of the mind" (Essay III.5.3). Just as human labor must be added to the spontaneous productions of nature for them to be worth anything (esp. II, 36; see Locke [1689a] 1983, 47), so human contrivance must "perfect" language to make it truly useful to man (Essay III.1.3; III.3.4).¹¹ The "general terms" used in moral and political discourse, being of human construction, can be known perfectly. Locke therefore envisions a moral science capable of demonstration (Essay III.9.16; see III.11.15-7; IV.3.18-20). As a part of moral science, the part of political science treating "the original of societies, and the rise and extent of political power" (Locke [1703] 1997b, 351-2) is capable of the improvement Locke undertakes in the Two Treatises.

The philosophical aspect of the Two Treatises can be seen in Locke's concern with correct definitions of axiomatic terms (Grant 1988, chap. 1; see also Danford 1978, 48-69; Tully 1980, 10-1). The Second Treatise begins by stipulating a definition of "political power" (II, 2-3) and proceeds with definitions of the state of nature, state of war, and civil society. As I argued above, all these definitions are offered by Locke as alternatives to the terms of sovereignty theory. He therefore defines "political power" in terms of the powers traditionally described as "sovereign" but without using that term, and he does so because of his basic doctrine of the natural freedom of the individual as revealed by the "state of nature," where there is no "right to dominion and sovereignty" by nature $(\Pi, 4)$. He then uses the basic terms of this theory to show the fallibility of the patriarchal sovereignty that tends to arise from natural human sociability and offers an alternative conception of the basis and limits of political authority founded upon the consent of naturally free and equal individuals. Even when Locke uses old terms, such as "political power" or the "state of nature," he gives them specific meanings. The Two Treatises is effectively an attempt to replace one political language with another.

Like the fallible linguistic endowment of nature, the associations that develop from natural human sociability require reform. Locke is particularly concerned that these associations have led to mistaken notions about the basis and limits of political obligation. He explores this fallible development in the chapters from the Second Treatise quoted at length above. The family grows to the point that resembles "a little commonwealth" (II, 86). The habit of living under patriarchal authority leads us "naturally . . . into that form of government" (II, 107), and the innocent people of "that poor but virtuous age" therefore erected unrestrained monarchies (II, 110). They later became aware of the dangers of paternal prerogative and "found it necessary to examine more carefully the original and rights of government" (Π , 111).

The "natural" forms of association stemming from the family suggest the mistaken notion that serves as the cornerstone of the patriarchal argument (and perhaps sovereignty theory more generally): men... are born under governments" (II, 114). Locke therefore offers an alternative account of the true origin of government through consent. Although he concedes the likely patriarchal roots of civil society (see II, 54, 105, 117, 175; Schochet 1969; Waldron 1989, 7), he argues that whatever resemblance the family may have to "a little commonwealth," it is very far from it, "both in its constitution, power and end" (II, 86). The subpolitical relationships of the family must be reformed along more reasonable grounds (see II, 78-82, 85, 116-22; see Pangle 1988, chap. 18; Resnick 1992). Since individuals are all equally born "with a title to perfect freedom," human associations in general must be conceived of—or rather reconceived of—as beginning in consent (Π , 87).

The Reasonableness of Consent

The doctrine of the origin of political power in consent and the language used to express it are meant to be reasonable: philosophically adequate as well as practically salutary. In order to answer critics of consent theory, including Filmer, who argued that founding political power on consent makes government unstable and ineffective. Locke wants to reform previous consent theory in order to make it reasonable. This effort can be likened to his project in the Reasonableness of Christianity ([1695] 1965), wherein he claims to show that Christianity is reasonable in its doctrines and demands based on what a "righteous God" could be "supposed" to mean and require, given a reasonable divinity who made man a rational creature and requires him to live by "the law of reason, or, as it is called, of nature" (§§1-4, 14; see Rabieh 1991). He faces a similar task in the First Treatise, where he seeks a more "reasonable" interpretation of the scriptural texts upon which Filmer and the divines have relied. Locke therefore reinterprets the divine donation to Adam in terms of rights and right reason. The divine grant "gave him not private dominion over the inferior creatures, but right in common with all mankind" (I, 24). And "it is more reasonable to think, that God who bid mankind

¹¹ The parallel between Locke's discussion of the conventions of language and of property, including money, could be developed. The value of money is introduced by a "tacit agreement" (II, 36), and the meaning of words is likewise based upon a "tacit consent" (Essay I.3.22; III.2.8). Similarly, both can be perfected by making the "tacit" conventions clear and express through institutions, through philosophy in the case of language and through monetary regulation in the case of money. Locke's writings on comage and monetary policy should be recalled in this context.

increase and multiply, should rather himself give them all a right" to make use of the animals for food and clothing even before the explicit grant to Noah (I, 41, emphasis added; see I, 39). Man is given a "strong desire of preserving his life and being" and "reason, which is the voice of God in him," and those endowments reveal to him his rights and the rights of "each individual person" (I, 86, 88). Locke thus clears the ground for his own theory and establishes that theory on a moral claim rooted in human nature (see II, 1).

Overarching Locke's philosophy as a whole is the idea of human rationality (Schouls 1992, 42-3). The criterion of reasonableness likewise spans his political teaching. As he states in explaining why naturally free individuals will give up natural authority to be held in trust by a society limited in its use of political power by the common good: "No rational creature can be supposed to change his condition with an intention to the worse" (II, 131). The criterion of reasonableness justifies both the beginnings and the ends or limits of the commonwealth. First, he shows why it is reasonable for individuals to consent to give up their natural liberty and subject themselves to political authority through his account of the "inconveniences" of the state of nature (see Grant 1988, 53-7). Second, he derives the limits to political power, and thus the limits of our obligation, from the same basis as the reasons for consent. For example, in the Letter Concerning Toleration, Locke ([1689a] 1983, 26) argues that the jurisdiction of civil magistrates is "bounded and confined" by the aims of civil government and cannot extend to matters of religious salvation, "nor can such power be vested in the magistrate by the consent of the people."

The act of consent itself is subject to the correction of reflection or reason. Reasonableness serves as the criterion for the end of government through justified rebellion. Here Locke offers people a language to articulate the feelings that contradict the mistaken notions they have been proffered. For example, he observes: "But whatever flatterers may talk to amuse people's understandings, it hinders not men, from feeling." He then articulates this feeling in the terms of his theory: "And when they perceive that any man, in what station soever, is out of the bounds of the civil society which they are of; and that they have no appeal on earth against any harm they may receive from him, they are apt to think themselves in the state of nature, in respect of him, whom they find to be so" (II, 94). Similarly, people "cannot but feel" the "long train of abuses" that justify revolution (II, 225; see II, 208-9), yet they "are more disposed to suffer, than right themselves by resistance," even when trespasses of authority are "sensible to the greater part" (II, 230). The people need to be exhorted in a language that translates their just feelings into a language of reasonable obligation. For the philosophical reform of political language to be effective in practice it must change common opinion and usage, or what we might even term "ordinary language." Locke is aware of both the "civil" and the "philosophical" use of words (Essay III.9.3). Like the Two Treatises itself, a combination of philosophy and political rhetoric, the language of obligation Locke offers within the work is both philosophical and common.

Locke's rearticulation of political power in terms of a language of reasonable consent and obligation can be seen in the Preface to the Two Treatises. There he declares his hope that his discourse will "establish the throne of our great restorer, our present King William; to make good his title, in the consent of the people, which being the only one of all lawful governments, he has more fully and clearly than any prince in Christendom; And to justify to the world, the people of England, whose love of their just and natural rights, with their resolution to preserve them, saved the nation when it was on the very brink of slavery and ruin" ([1689b] 1988, 137). William may have come to his throne as a "restorer" through inheritance (that of his wife), but he owes any title to legitimate rule to the consent of the people. By stipulating a language of obligation, Locke counsels the ruler by alerting him to the true basis of his authority. He also instructs the ruled by declaring to them their "just and natural rights." Locke rejects the constitutional justifications being given for the Glorious Revolution and offers his theory of consent instead (see letter to Edward Charles, cited in Ashcraft 1986, 597-600; see also Den Hartogh 1990, 112-3). He does not legitimize existing rule so much as provide a language through which authority may be justified.

Interpreting Locke's theory in terms of a language of obligation that appeals to the criterion of reasonableness may reveal a middle way through the complex scholarly debate over consent in his theory. On the one hand, reasonableness is central to those who interpret Locke as a "hypothetical" consent theorist insofar as they argue that he offers a theory of what people might be supposed to have consented to (see Pitkin 1965, 990-9; Pateman 1985, esp. 66; Steinberg 1978). On the other hand, the embodiment of this doctrine in a language of obligation spoken by a political community eventually allows for more express forms of consent, forms that Locke himself seems to have desired (see Ashcraft 1992; Dunn 1967). Whether Locke offers a theory of hypothetical consent or actual consent, the central issue is his argument that to conceptualize and articulate political relations in terms of consent is to be able to offer an account of their reasonableness (see Simmons 1992).

The Limits of the Language of Obligation

Although Locke offers a language of reasonable obligation, he is nonetheless keenly aware of the limits of speech and reason in politics. Naturally free individuals are born subject to the law of nature (II, 6), which is

¹² For "ordinary language" approaches to political theory, including Locke, see in particular the work of Pitkin (1967, 1972), Flathman (1972), and Danford (1978).

"the law of reason" (II, 57). The law of reason governs the state of nature as well as civil society, and it stands as a rule for governors and governed alike in their exercise of authority. Yet, political authority is necessary in large measure because of the fallibility of human reason. "For though the law of nature be plain and intelligible to all rational creatures; yet men being biased by their interest, as well as ignorant for want of study of it, are not apt to allow of it as a law binding to them" (II, 124). Educating individuals in the law of reason and a language of obligation based upon it, as Locke does, may help promote the responsible exercise of natural and political power; but human reason cannot succeed alone. Those who renounce reason and adopt the way of the beasts may be justly punished (II, 11, 171, 181). The use of force without authority may justly be opposed by force (II, 155). In the last analysis, however, naturally free individuals must judge when force is authorized. The criterion of reasonableness stands as a rule, but although sometimes corrigible, judgment is fallible. The need for force in politics and against it is itself a reflection of the limits of human reason and of Locke's language of obligation.

THE CONSTITUTION OF THE LIBERAL STATE

Locke's sovereignless state necessarily produces coexistent claimants to supreme authority, but a shared political language provides its speakers with the means to express and assess their mutual obligations as well as their competing claims. The tensions in the liberal tradition revealed by the simultaneous discourses of individual natural rights, popular sovereignty, and governmental authority are likewise negotiated in political speech and action. If government in a liberal state founded upon the doctrine of individual natural rights is to be of the people, by the people, and for the people, then the institutional mechanisms that are so often the focus of analysis are insufficient for maintaining the perceived legitimacy of the state. Understanding the relationship between the structure of Locke's commonwealth and the language of obligation he offers to help bind it together should help us better appreciate the constitution of the liberal state.

The importance of shared political concepts for the proper working of the liberal commonwealth is evident in the American regime. 13 The major documents of the American founding period are declarations of principle that articulate a lexicon of political language to which its speakers can refer (see White 1984). The Declaration of Independence not only proclaims the "selfevident truths" of the rights of naturally equal individuals but also, through the very act of proclaiming them, establishes a "people" apart. The Constitution is both an institutional framework and a declaration of the "people" forming a more perfect union in order to realize the promise of a government designed to protect our rights. An opponent of the proposed Constitution, the "Federal Farmer" (1787, in Storing 1981, 2, 324-5) articulated the importance of declaring the basis of obligations and their limitations in his call for a bill of rights:

We do not by declarations change the nature of things, or create new truths, but we give existence, or at least establish in the minds of the people truths and principles which they might never otherwise have thought of, or soon forgot.... What is the usefulness of a truth in theory, unless it exists constantly in the minds of the people, and has their assent:-we discern certain rights . . . which the people of England and of America of course believe to be sacred, and essential to their political happiness . . . while the people of some other countries hear these rights mentioned with utmost indifference. . . . The reason of the difference is obvious—it is the effect of education, a series of notions impressed upon the minds of the people by examples, precepts and declarations.

A proponent of the Constitution, Madison, came to see a similar use of constitutional declarations of principle through a bill of rights: "The political truths declared in that solemn manner acquire by degrees the character of the fundamental maxims of free Government, and as they become incorporated with the National sentiment, counteract the impulses of interest and passion" (letter to Jefferson of October 17, 1788, in Madison 1981, 158). The tensions in modern liberal states over competing claims of individual and governmental authority endure, but the very viability of the commonwealth may rest upon its members being able to speak a common language.

The Possibility of Self-Government

COLIN BIRD University of Virginia

any have suggested that the findings of social choice theory demonstrate that there can be no "will of the people." This has subversive implications for our intuitive concept of self-government. I explore the relation between the notion of a "social will," that of self-government, and the impossibility theorems of social choice theory. I conclude that although the concept of the social will is essential to that of self-government, the findings of social choice theory do not cast doubt upon the possibility of either. Unlike many attempts to respond to the threat posed by social choice theory, my argument does not require any appeal to the problematic notion of the common good.

o speak meaningfully of an organization or political community as self-governing requires that it have (or implies that it has) the property of having, knowing, and consciously pursuing its own "will." As an abstract proposition, this claim is not especially controversial, but exactly how the standard it sets might actually be met remains a matter of deep dispute. I will address a particularly strong form of skepticism about the possibility of satisfying this requirement. This is the claim made by certain social choice theorists that it is not merely difficult, but logically incoherent, to believe there are social procedures under which collectivities can learn their own will. I hope to show that, whatever other problems theories of the "social will" face, this particularly strong objection can be answered, and in a way that opens up fruitful avenues for further inquiry. I begin by briefly setting out the objection that I aim to defuse.

THE SOCIAL CHOICE OBJECTION

Starting with Kenneth Arrow's ([1951] 1963) seminal monograph, social choice theorists have sought to identify procedures under which a collectivity might identify the preferences that could reasonably count as its own. Taking for granted relatively uncontroversial liberal democratic assumptions, the social choice theorists asked a simple question: How can one devise procedures to "process" or "aggregate" the impartially weighted preferences of individual members of a collectivity into a preference that can stand for the collectivity as a whole? The answer Arrow and his successors repeatedly gave was that the only procedures capable of identifying a coherent and unambiguous collective preference or "will" involve either deferring to the judgment of a dictator or narrowing in advance the range of preferences that citizens are permitted to express. Neither of these ways of generating a coherent collective preference seems to satisfy our intuitive sense of what it means for something to have its own will. No one would be satisfied by the suggestion that a society whose decisions are determined for it by a dictator is genuinely following its own will. Similarly, to impose a blanket prohibition on society choosing a certain preference ordering, even though all its members would otherwise do so, may also seem inconsistent with the notion of society following its own will. Arrow's terminology is telling here: To violate this second proviso is to violate a norm of "citizen sovereignty."

In the years since Arrow's initial contribution, social choice theorists have both confirmed and deepened the general point (McKelvey 1979; Plott 1976; Riker 1982; Schofield 1985; Sen 1970). As a result, they have been increasingly confident in their claims about the implications of social choice theory. It is now standard for these theorists to claim that the impossibility theorems, because they establish there can be "no such thing as the will of the people" (Maclean 1991, 509), mandate a certain kind of methodological individualism. Willing, preferring, and choosing are not possible predicates of societies, and to think otherwise is to engage in a primitive kind of anthropomorphism (Riker 1982, 18; Schelling 1984, 93). The comments of Charles Plott (1976, 525) are representative:

The concept of social preference involves an illegitimate transfer of the properties of an individual to the properties of a collection of individuals.... The Arrow theorem demonstrates that the concept of social preference involves the classic fallacy of composition, and it is shocking only because the thoughts of social philosophers from which we have developed our intuitions about such matters are subject to the same fallacy.

I seek to refute this kind of claim and to show how having a will might be a possible property of both societies and individuals. Before I tackle these claims, I want to set the technical issues raised by social choice theory within the broader context of discourse about self-government. This is essential if we are to understand the nature of the difficulty identified by social choice theory and its relation to the larger theoretical issues that it often claims to resolve.

SELF-GOVERNMENT: SOME PRELIMINARIES

Very roughly, to say that a political community or organization is self-governing is to say that in some sense or senses the actions taken or controls imposed

Colin Bird is Assistant Professor of Government and Foreign Affairs, University of Virginia, Charlottesville, VA 22903.

The author thanks Talbot Brewer, James Cargile, Dan Devereaux, Joshua Dienstag, Paul Freedman, George Klosko, Charles Kromkowaki, Debra Morris, Steven Wall, Brantly Womack, and several anonymous referees for their extremely helpful comments on earlier versions of this article.

by its governing institutions can be thought of as originating from within that community or organization. There is no essential or canonical specification of the senses in which self-government demands that authoritative action be internally "sourced" in this way. To set the stage for my argument, however, I will identify three salient ways in which one might claim that authoritative action originates from within a self-governing political community or organization. I will then use these three senses of self-government to make several preliminary points about self-government, democracy, and social choice theory.

A first and relatively undemanding sense in which a group can be self-governing operates at a basic institutional level. A society can be self-governing simply to the extent that the apparatus of government and administration is operated exclusively by officials and participants drawn from within, and authorized by, the citizen body, not by outsiders. In this institutional sense, imperial domination is the antithesis of self-government.

A second and more demanding interpretation of the idea that public action originates from within makes use of our organizing idea of a social will. In this view of self-government, public decisions must be plausibly understood by members of the collectivity as reflecting, expressing, or revealing a will that is authentically their own, and there must at least be social consensus on procedures for determining or verifying the content of this will, such that one can in principle assess the extent to which public action fulfills or deviates from it. Self-government in this sense requires that the political community itself be the subject of political action at least in the following minimal way: Both governors and governed must recognize accepted "will-revealing" procedures and view them as communicating instructions, which governing agencies are then expected to execute as a matter of course. If this condition were satisfied, we could meaningfully speak of a society or organization being the author of its own fate, at least insofar as the actions it takes successfully fulfill a will that has been appropriately certified as its own. It is the possibility of ever satisfying this condition that social choice theory calls into question.

A third and still more stringent sense in which public action might have an internal source results in a highly moralized (and I believe marginal) conception of selfgovernment. In this account, society is self-governing to the extent that its government acts only in the light of a plausible conception of citizens' common good. The idea is that officials take the whole community's welfare (the "public interest") to be the main object of public action, and they appeal to a plausible account of this common good as the grounds for public action. In this sense, a community is self-governing insofar as public action is oriented only to those goals and ends identifiable as proper, rather than alien, to the whole community. This rules out justifications for public action that either appeal to goals and values that go beyond the welfare of the relevant community (the progress of mankind in general, fulfilling God's providential design, and so on) or privilege the interests of narrower sectional or partisan groups within the community. For instance, juries might seem to be self-governing in a variety of other senses (e.g., juries do act in accordance with their will), but they are not self-governing in this third sense, for a jury does not derive justification for a verdict on a particular occasion from a set of claims about its own well-being but, rather, looks to something beyond itself—the fate of a third party.

Similarly, a society whose ruling class justifies the exploitation of the rest of the population by reference to its own partisan interests, rather than to those of the whole society impartially considered, is not self-governing in this third sense. In such a case, justifications for public action are not grounded in claims about the best interests of society as a whole but in claims about the interests of a partisan subset of the community. Here, it seems more accurate to say that one social group is simply subjugated to another in that the former's interests are not given due weight in the (purported) justifications for public action offered by the ruling class. One can reasonably claim that this sort of subjugation is inconsistent with at least ideal forms of self-government. Certainly, the history of modern concepts of self-government, from Rousseau on, is replete with examples of theorists and commentators who have understood the concept in this way.1

To set the stage for my argument, I now make several connected observations about these three senses of self-government.

Self-Government and Democracy

The concept of self-government has an elective affinity with the idea of democratic rule. But if democracy requires simply that all citizens in a given state (have a right to) participate in the political process, then strictly speaking it is not true (1) that any of these three senses of self-government requires democracy or (2) that democracy entails self-government in any of the three senses. Hobbes's political theory illustrates the first point: Citizens can will their collective security and self-preservation by authorizing highly undemocratic forms of government; even a monarchical Leviathan instantiates Hobbesian self-government.

The second point is illustrated by those empirical theories of democracy inspired by the work of Joseph Schumpeter (1942) and his antecedents (Michels 1916). These modern theorists of democracy regarded the notion of self-government as obsolete and prescientific, in part because in their view it tends to obscure the systematically oligarchical reality of political organizations. Despite this, they believed that a theoretically useful theory of democracy could be retrieved from the conceptual swamp left behind by the philosophers of self-government.² The findings of social

¹ This sort of claim is normally brought in under the aegis of claims about the virtues of citizenship. Such virtues require that citizens be motivated by a concern for the public good rather than by their self-interest (their "particular wills," in Rousseau's terminology). Self-government, in this view, requires a virtuous citizenry. For a recent statement of the idea, see Barber 1993, 66.

² For a superb illustration of this tendency to dissociate democracy

choice theory tend to reinforce the intuitions of those in the Schumpeterian tradition. In this view, of which William Riker (1982) was the most vociferous proponent, the social choice objection demonstrates that the only viable conceptions of democracy available to us are ones that drop the idea that democratic votes express a popular will. We are left with a much less ambitious—in Riker's terms, "liberal"—conception of democracy. It demands merely that all citizens (have the right to) participate in a set of political processes that provide some kind of external check on the activities of oligarchical political elites. The ability of democratic political systems to institutionalize this sort of check does not, however, imply that when the check is invoked, "society" as a whole is concertedly acting in accordance with something called "its own will" (Riker 1982, 243-5). Rather, the democratic system can be thought of as a rather crude, although at least inclusive, arbitration device. According to Riker and his followers, social choice theory provides a cast-iron justification for severing the connection between democracy and the problematic idea of self-government. This conclusion is apt to seem shocking: If authentic democracy requires anything, it is surely that public action track the popular will. But it is just this conception of democratic self-government that social choice theory calls into question. In order to retrieve that conception, we must defuse the social choice objection and show how there can in principle be such a thing as the popular will.

Self-Government and the Common Good

Self-government in the third and most demanding sense shades into, and becomes difficult to distinguish from, some more general account of political justice and the social good. For this reason, we should regard this third sense as lying at the very periphery, rather than near the core, of the concept of self-government. This is supported by the intuitively plausible reflection that a self-governing society need not be an especially good society.3 The first two senses of self-government preserve that intuition, but the third sense overturns it. A society could be governed only by its own members (first sense), and it could know and pursue its own will (second sense), but from neither supposition does it automatically follow that this society acts in accordance with its common good. The social will might be misguided or even evil, and those citizens who wield power might be entirely corrupt. The third sense, however, precludes these possibilities, because when policy runs counter to the correct appreciation of the common

and self-government in modern empirical research, see Duverger 1954, 424: "No people has ever been known to govern itself and none ever will. All government is oligarchic: it necessarily implies the domination of the many by the few.... All government implies discipline... by definition constraint is external to the constrained. A people does not constrain itself, it is constrained. It does not govern itself, it is governed."

good and its imperatives, the relevant society is not fully self-governing. But this seems far too strong. It might make sense to say that such a society falls short of the moral ideal of a perfectly self-governing community, but it is implausible to say that it is violating conditions that are either strictly necessary or sufficient for us to be able to describe it as genuinely self-governing.

The Central Sense of Self-Government

If the third sense seems too strong, the first seems too weak by itself to count as a sufficient condition for self-government. Yet, the first sense does appear to embody a necessary condition for regarding a community or organization as authentically self-governing. Although the absence of (say) imperial domination does not automatically guarantee that a society is self-governing (there have been plenty of nonimperial autocracies), it is clear enough that any form of imperial domination is strictly incompatible with self-government. By contrast, the second sense looks very much like a sufficient condition for self-government: If we can show that a society is acting upon a will that it knows to be its own, it is unlikely that we need to establish anything more in order to convince ourselves that this society is self-governing. There might be a further question about whether this society is good, but we have already seen that a self-governing society need not be good: The mere fact that a certain society is pursuing policies inconsistent with the common good or social justice, or that are in some other way ethically problematic, does not automatically establish that it is not self-governing. As long as public policy fulfills the social will (for good or ill), that seems sufficient to show that this society is self-governing.

The Independence of the Second and Third Senses

These observations suggest not only that the second sense of self-government is the central one but also that it is largely independent of the third. This is a pivotal point in my argument. One of the main claims I advance is that many of the difficulties involved in the notion of self-government can be removed by maintaining a clear distinction between the second and third senses. That is, we should separate the question of how society can determine its own will from that of how we might discern the public interest or society's common good. Both classical and contemporary discussions of self-government have systematically confused these two issues. Two characteristic forms of this confusion have particularly plagued these discussions.

Confusion 1. Sometimes it is assumed that there is ultimately no way to specify the common good apart from somehow amalgamating citizens' judgments on some occasion about what the common good requires. The effect of this move is to collapse the third sense of self-government into the second: In this view, the notion of the common good involved in the third sense

³ Note, however, that this is perfectly compatible with the claim that any authentically good society would have to be to a high degree self-governing.

is identified with whatever society contingently nominates as its common good through the kind of "willrevealing procedures" envisaged in the second sense. Social choice theorists are particularly prone to making this move, mainly because they subscribe to an attenuated version of utilitarianism that views the public interest or common good as an aggregative function of the contingently expressed preferences of a society's constituent individuals. Therefore, they are tempted to claim that answers to questions about society's common good or the public interest stand or fall on the results of voting procedures that aggregate citizens' various views on the subject. Consider in this regard Riker's (1982, 137) claim that social choice theory "even leads us to suspect that no such thing as the 'public interest' exists, aside from the subjective (and hence dubious) claims of self-proclaimed saviors" (see also Plott 1976, 526-7). Riker seems to think this follows from the fact that the impossibility theorems show that outcomes of votes will systematically be ambiguous or meaningless.

But this inference is surely invalid. We would not normally conclude from the fact that individuals make contradictory or ambiguous claims about their own interests that there is no longer any basis on which to make credible assessments of their best interests. Still less does it show there is "no such thing" as an individual's best interests. Perhaps the individual in question is simply confused or ill informed. The same point applies with equal force in the case of claims about the best interests of a collectivity (i.e., the common good). The fact that citizens' amalgamated judgments about their common good are (even systematically) ambiguous or incoherent is not a reason to suppose that no such thing as the common good or public interest exists or can be determined. The salient question in this context is: What is the common good, and what does it require under circumstances A, B, C? But a claim about the ability or inability of a particular agent or agency to enunciate a clear, unambiguous answer to this question does not amount to any sort of answer to that question itself. We would at the very least need some additional argument to show that this particular agency's opinion on the subject carries special authority, so that its failure (say) to arrive at a clear, coherent answer definitively establishes that the question itself just is finally unanswerable. After all, the fact that some agent manages to enunciate a coherent, unambiguous view of its own best interest does not in any way imply that that view is correct or even plausi-

To my mind, these reflections highlight the fundamental gap between two issues raised, respectively, by the second and third senses of self-government. The second sense raises the question of how we can establish that a particular judgment about the common good can genuinely be regarded as society's own will. The third sense raises the different issue of how we can determine a correct or plausible account of society's common good. Perhaps social choice theory puts in doubt the possibility of ever resolving the first issue, although that is the claim I seek to refute. But even if

my argument fails, it still does not follow that social choice theory puts in doubt the possibility of resolving the second issue; determining the common good is a different problem, and there is little reason to believe the apparatus of social choice theory is equipped to address it. Note, finally, that one can admit all this without in the least casting doubt on the proviso that, properly understood, the common good is a function of the welfare of the individuals who make up the political community. This unobjectionable proviso must be distinguished from the very different and more dubious claim that the common good is whatever citizens contingently judge it to be on some occasion.

Confusion 2. A second way in which the second and third senses of self-government are often conflated moves in just the opposite direction, by effectively collapsing the second sense into the third. This occurs when one succumbs to the temptation to stipulate that some putatively valid account of the common good (and its correct application to contingently arising social and political problems) embodies the "real will" of the people. On this sort of view, in order to disclose the people's will on some occasion, we need only grasp the correct account of their common good and determine what it recommends under the relevant circumstances. This proposal derives such plausibility as it has from the Socratic intuition that agents, to the extent they are rational, will their own good. When individuals or groups will what is counter to their best interests, they must have failed to understand or grasp what they "really" will. This assumption undoubtedly underlies a good deal of the mistrust of popular rule voiced over the centuries. If we suppose that the average citizen is not competent to determine the common good, then the "real will" of the people may be better served by taking power out of their hands and giving it to "the experts."

Some political theorists have tried to defend popular rule even within the terms of the Socratic assumption. Rousseau (according to some influential interpretations) is responsible for the most historically significant version of this argument, and for that reason I refer to it as the General Will argument. It confuses the social will and the common good in exactly the way I am trying to identify. In order to diagnose this second confusion and highlight its shortcomings, I will briefly discuss some salient features of the General Will argument.

THE GENERAL WILL ARGUMENT

The common good requires that we give fair consideration to the best interests of all citizens, and the General Will argument suggests that the citizenry in full assembly is the appropriate "expert" on the common good. To the extent that we entrust power to groups smaller than the whole citizenry, we increase the likelihood that government will unfairly privilege the interests of some partisan sector of the community. This argument need not imply that the whole citizenry is infallible, merely that a virtuous citizenry is more

likely to identify correctly the general will than are any of the less inclusive alternative candidate groups. The latter are more likely to be unduly influenced by their narrow sectarian interests and so are likely to offer correspondingly less reliable guidance as to the content of the general will or common good.

Today, political theorists appeal to versions of this argument in order to respond to the difficulties raised by social choice theory. But if social choice theory calls into question the idea that we can identify a will that is society's own, it is not clear that the General Will argument is capable of supplying an adequate response. The reason is that this argument implausibly reduces the concept of the social will to that of the common good. Consider a contemporary variant of the General Will argument that has been defended by a number of theorists who sometimes describe themselves as "epistemic populists" (Cohen 1986; Coleman and Ferejohn 1986; Grofman and Feld 1988; Radcliff 1992).

Epistemic populists respond to social choice theory by defining the general will as an "independent standard of correct decisions—that is, an account of justice or of the common good that is independent of current consensus and the outcomes of votes" (Cohen 1986, 34). This is exactly the reduction of the social will to the common good to which I am objecting. Epistemic populists then require that voters express their sincere beliefs about the content of the general will in specific instances. Under this requirement, voters do not merely assert whatever unreflective preferences happen to pop into their heads, so epistemic populists believe that "public deliberation is guided by the principles that define ... [the general] will" (p. 34). This transforms the context and purpose of voting. Citizens are now expected to vote on the basis of good faith attempts to discern the general will. Clearly, this obviates social choice theory's search for an all-purpose aggregation function that can reveal a social preference in the absence of any restrictions on the preferences individuals are permitted to express. Moreover, under these conditions, the outcomes of votes can constitute compelling evidence about the content of the general will or common good, or so the argument goes.4

As will become clear, my own argument shares many features of this approach. But as it stands, this epistemic populist proposal does not satisfactorily explain why the outcomes of these sorts of votes should automatically count as the social will. Epistemic populists simply recruit their specially configured voting procedures to the project of determining what some antecedently specified and independently valid account of the common good requires under specific circum-

stances. Even if we concede that epistemic populist voting procedures do indeed provide reliable evidence about the common good and its imperatives, is it obvious that we establish the content of the popular will by applying them? Suppose a society conducts a vote along the lines recommended by the epistemic populist. Citizens now have good reasons to believe that the victorious policy conforms to, or is dictated by, the common good. But are they entitled to infer from this fact alone that the winning policy constitutes their own will? Only if they already know that the epistemic populists' voting procedures are an appropriate barometer of their collective will. Yet, the mere fact that those procedures are built around a plausible view of the common good does not establish that this is so: Perhaps there is a conflict between what the common good actually requires of a society and what that society might—on further reflection—choose to will for itself.

Suppose, for example, that putting a man on the moon is a complete waste of valuable social resources from the point of view of the common good: The money would be far better spent improving the condition of disadvantaged citizens. This fact alone hardly establishes that a society has collectively decided to stop funding moonshots. After all, members of society might choose to sacrifice their common good to the goal of putting a man on the moon. Perhaps they see themselves as responsible not just for their own common good but for the progress of mankind in general. In such cases of a conflict between the common good and the social will, the content of that will cannot simply be read off the best available account of society's common good, even if we determine the latter through some sort of voting procedure.

At best, then, epistemic populism justifies a kind of social decision procedure that can be expected to (1) generate meaningful results and (2) provide reliable guidance about what the common good requires on specific occasions. But these do not constitute answers to the question which I am considering and which social choice theory claims is unanswerable. That question is not: What is the common good, and what does it require? The question is: What is it that we, as a society, actually want to do? To be sure, this latter question requires that we identify some clear, unambiguous result, but it does not require that the result be mandated by the common good. Instead, it requires that in arriving at a certain result, society must "know" that it is being true to itself or must authentically express its own view (right or wrong) of what ought to happen. If we are to respond to the social choice objection, then we have to show how this can be so, and how citizens can come to know that this is so.

To the extent that epistemic populists and other proponents of the General Will argument offer any answer to this question, it comes in the form of the Socratic stipulation that the social will and the common good must ultimately be one and the same. Defining the general will as the common good properly understood effects just this equation. But as an answer to our question about the possibility of self-government, this stipulation has at least two decisive drawbacks. First,

⁴ Arrow ([1951] 1963, 85) had already anticipated this proposal in his original monograph, suggesting that it "has much in common with the statistical problem of pooling the opinions of a group of experts to arrive at a best judgment, here individuals are considered experts at detecting the moral imperative." If one assumes the existence of a "right answer," and individuals are likely to arrive at the correct decision on their own more than 50% of the time, then the probability that a majority will be right increases as the size of the relevant group increases. See Barry 1990, 292–3.

notions of the common good or the public interest are not exactly unproblematic. If we are seeking to dissolve the ambiguities and problems of the notion of a social will, then an appeal for aid to the equally vexed notion of a "correct account of the common good" is like throwing out an anchor to save a drowning swimmer. There is every reason to demand that unravelling the mystery of the social will not await a solution to the riddle of the common good.

Second, stipulating an equivalence between the social will and the common good radically distorts the relation between the idea of self-government and the notion of freedom. Intuitively, the concept of selfgovernment commands our moral attention in large part because it seems to be a condition for a certain kind of social freedom. A society that is not selfgoverning is in some way subjugated, enslaved, subordinated to alien forces, and so on, and in these senses is unfree. By contrast, a society that acts on a will that it knows to be its own is (to that extent) free in the sense relevant to the concept of self-government. But such a society is surely no less free in this sense if its will is misguided or runs counter to its common good. To establish that a society is free in this sense, we need only establish that social action is loyal to society's own view (right or wrong) of what ought to be done. If we follow the General Will argument, however, and stipulate that society's real will or general will is whatever the common good properly requires, then we completely invert these perfectly sound intuitions about freedom. If freedom is a function of acting in accordance with the social will, and the social will is really the common good, then whenever a society opts for a course of action inconsistent with the common good it is acting unfreely, because it is not (really) acting in accordance with its (real) will. On this view, assuming for the sake of argument that he understood the common good plausibly, Plato's Republic becomes the ideal of a free, self-governing political community, whereas the Athenian democracy that put Socrates to death becomes its antithesis. This is surely absurd, quite apart from Plato's idiosyncratic view of the common good. We may agree with Plato that Athens made a catastrophic mistake when it condemned Socrates, but it seems bizarre to claim that for this reason Athens was acting unfreely or was somehow subjugated to "alien forces" when it chose to convict Socrates. But by stipulating an equivalence between the social will and the common good, proponents of the General Will argument are forced into this deeply counterintuitive account of social freedom.5 The price of reducing the social will to the common good is the sacrifice of the concept of freedom implicit in our intuitive concept of self-government.

Ideally, of course, we might hope that members of a fully self-governing society both organize themselves so as to secure their common good and know that in doing so they are enacting a will that is authentically theirs. When both conditions are met, we can say that society is freely and willingly pursuing its true common good. But the means by which we determine that social practices and policies conform to the common good and that they fulfill society's will are, and should be, independent. If we conflate them in the manner of the General Will argument, we risk losing our grip on the form of social freedom that lends moral weight to the ideal of self-government.

The lesson, then, is that the second and third senses of self-government should be kept apart. It is a mistake to suppose that the absence of a social will implies that there is no way to determine the content of the common good (the first confusion), but it is also wrong to think that appealing directly to some conception of the common good and defining it as society's "real will" (the second confusion) allows us to supply a satisfactory answer to the social choice skeptic. Such a response requires a direct and free-standing account of how a political community might identify a will as its own. Below I attempt to show that the results of social choice theory at least do not shortcircuit this project.

THE ANALOGY BETWEEN INDIVIDUAL AND SOCIAL WILL

The concept of collective self-government suggests an analogy between individual agents and collectivities. According to this analogy, a collectivity can be an actor in its own right, capable of formulating and determining its own will, and thereby responsible for its own choices and self-determination. Social choice theorists typically claim that their results "demonstrate" that any such analogy "involves an illegitimate transfer of the properties of an individual to the properties of a collection of individuals" (Plott 1976, 525). The social choice theorems largely derive their shock value from their claim to expose such analogies as logically confused.

This claim is mistaken, however. Understanding why is the key to my strategy in this paper. To see this, however, it is first important to grasp the overall structure of the argument that persuades social choice theorists of this claim. This argument has four steps: (1) We can formulate a number of conditions that any social decision procedure capable of generating clear, unambiguous results would have to satisfy in order for us to certify its ability to enunciate a "will" that is authentically society's own. (2) It is logically impossible to satisfy all these conditions in a way that permits meaningful, coherent results to emerge. (3) Therefore, there is no possible decision procedure for identifying a social will since there is no way to satisfy the authenticity criteria and at the same time produce clear results. To say that no such procedure is logically possible is tantamount to showing that there is no such thing as the popular will. (4) Because we routinely assume that when individuals decide on a course of

⁵ Just this line of argument has led a host of critics to demur at Rousseau's notorious claim about forcing citizens to be free. They think that Rousseau gave the game away when he claimed that the "General Will is never wrong" and that popular participation in expressing it causes "the public to learn to know what it wants." Social choice theory tends to reinforce the suspicion that Rousseau's democratic and voluntarist terminology disguises an essentially Platonic dogmatism.

action or preference, those decisions do or at least may reflect their own will, it follows that collectivities are to this extent fundamentally unlike individuals. They are not agents in the way that individuals are because it is meaningless to think of them as having their own will.

This argument is decisive only if we are sure that the social choice theorist's conditions are reasonable constraints on purportedly will-revealing procedures. If they are unreasonable or nonessential, then the argument collapses, because the violation of those conditions will no longer automatically imply that a coherent result does not authentically represent the social will. I suggest that the conditions imposed by social choice theory are not necessarily essential or even reasonable in the context of attempts to identify a social will. If so, then will-revealing procedures may legitimately violate these conditions, and the idea that society can identify a will of its own is not threatened by the results of social choice theory.

We need to understand, therefore, the conditions imposed by social choice theorists and the implicit expectations they make of reasonable will-revealing procedures. I will focus on five conditions.⁶ The first embodies the expectation that these procedures generate transitive results:

T (Transitivity): For any alternatives x, y, and z, if x is preferred to y and y is preferred to z, then x is preferred to z.

For our purposes, T is the only relevant expectation of decisions. Preference orderings that violate T are said to be "cyclical." The problem with cyclical orderings is that they fail to communicate a clear, unambiguous preference. The relevance of this condition to the present argument is clear. If the public is to be in a position to communicate a will to governments expected to execute it, then acceptable will-revealing procedures must satisfy T. Otherwise, the procedures will enunciate cyclical judgments and thus fail to identify any clear instructions or decisions to the institutions authorized to execute the social will.

The remaining four conditions embody expectations of the amalgamation procedure that is supposed to process the inputs of each citizen into a final judgment representative of society's own will.

- P (Weak Pareto Principle): For any alternatives x and y, if all individuals prefer x to y, then society prefers x to y.
- D (Nondictatorship): There is no individual such that, for every set of individual orderings, for all alternatives x and y, if that individual prefers x to y, then society prefers x and y.
- U (Unrestricted Domain): For any set of alternatives and any set of individuals, the domain of the social welfare function includes all orderings of alternatives by individuals.
- I (Independence of Irrelevant Alternatives): For any alternatives x and y, if the preferences of all individuals as between x and y remain the same, then the

preference of society as between x and y depends only on the preferences of individuals as between x and y.

In what follows, I will refer to this set of conditions on both decision and aggregation as the *TUPID* conditions

The social choice theorems show that we cannot satisfy all the *TUPID* conditions at once: We must choose between T and one or other of the remaining four. This claim is the second of the four steps in the argument I set out above. But can this second step establish the later claims in the sequence? Can it show that there is no such thing as the popular will and that the analogy between individual and collective agency must be spurious?

To see that the answer is "no," consider the following two claims: (A1) Societies are potentially like individuals because they can have their own will, and (A2) societies are potentially like individuals because both are able to determine the content of their will in analogous ways.

Note that A1 does not imply A2. It is possible that both individuals and collectivities can have a will of their own, but that there is no resemblance whatsoever between the respective procedures under which these two kinds of agencies determine the content of their will. But A2 assumes A1: If we know that societies are able to determine their will in the same way that individuals do, then we presuppose that societies can have a will.

The difficulty facing the social choice argument is this. Social choice theorists claim to falsify A1 (there is no such thing as the popular will), but to do so they deploy an argument compatible with the truth of A2. Their argument cannot decisively falsify A1, since it is presupposed by A2.

How is the social choice argument compatible with the truth of A2? The answer is that social choice theorists (rightly) acknowledge the possibility that the TUPID conditions might also apply to the case of individual decision making (Hurley 1989, 226f; May 1954; Roemer 1996, 25-6; Steedman and Krause 1986). The standard way of making the case points out that when individuals are called upon to express preference rankings over defined alternatives (say, candidates for a professorship), they very rarely have the luxury of being swayed by a single dimension. Rather, they must rank candidates relative to a range of emergent preferences along different dimensions: teaching ability, reputation, quality of written work, affability, compatibility of research interests with members of the department, and so on. Moreover, these dimensions will very often generate widely divergent rankings. In principle, an individual seeking to arrive at a final transitive ranking must find some way to process these emergent lower dimensional rankings into an overall (all things considered) ranking, much as a society must find some way to amalgamate individuals' preferences into a social preference. If the TUPID conditions define reasonable will-revealing procedures in both these cases, then A2 has been conceded.

⁶ These conditions are taken from Hurley 1989, 229.

It is relatively easy to stipulate equivalent *TUPID* conditions for the case of intrapersonal deliberation. I will follow Hurley's (1989, 231) extremely helpful stipulation of *TUPID* analogues for individuals seeking a "coherence function" capable of processing several criterial rankings of alternatives into an "all-things-considered" ranking. Apart from *T* itself, which remains unchanged, Hurley amends the other four conditions as follows.

P* (Weak Pareto Principle): For all alternatives x and y, if all criteria rank x above y, then x ranks above y all things considered.

D* (Nondictatorship): A coherence function must not give so much weight to one criterion that it outweighs any criterion that conflicts with it under any circumstances. That is, it must not be the case that there is one criterion such that any one alternative's superiority over any other according to this criterion would always result in its superiority all things considered, regardless of how other criteria might rank those alternatives.

U* (Unrestricted Domain): For any set of alternatives and any set of criteria, the domain of the coherence function includes ordering of all alternatives by criteria.

I* (Independence of Irrelevant Alternatives): For all alternatives x and y, if the rankings of x and y by all criteria remain the same, then the ranking of x and y all things considered remains the same; that is, a deliberator's ranking of a pair of alternatives all things considered depends only on the ranking of those alternatives by all the relevant criteria, not on the rankings of other alternatives.

If it is plausible to claim that these conditions apply to individuals trying to process several emergent preferences over given alternatives, then it would seem to follow that transitive decisions can be reached only by violating one or other of the TUPID* conditions. Roemer (1996, 26) suggests that this conclusion is an "unexpected bonus" of Arrow's theorem. But it seems to me that it gives the game away. If these conditions apply in the individual case, then this undermines the ability of social choice theory to adjudicate the question of whether there is such a thing as the popular will. Once we allow this possibility, we concede the possible validity of A2, and we can no longer claim to be establishing that A1 is false.

To see that this is right, suppose it is plausible to depict the individual will along these lines. The violation of one or other of the *TUPID* conditions then becomes a generic condition of all aggregation that results in transitive outcomes, whether individual or collective. If we assume that this form of aggregation captures essential features of any will-revealing procedure (whether individual or social), then this would imply either (1) that neither individuals nor collectivities have a will or (2) that in both instances the violation of the *TUPID* conditions is a precondition for identifying such a will. Clearly, neither claim is capa-

ble of establishing that the ability to will belongs to individuals but not to collectivities.

Alternatively, the social choice theorist could simply drop the idea that the TUPID conditions apply in the individual case and say that they are appropriate only in the collective case. This at least would allow one to claim that individuals can have wills but collectivities cannot. There are two difficulties, however. First, this cannot serve as an argument to the proposition that it is futile to model collective decision on the analogy of a single individual. The argument rests on the assumption that this analogy is misguided. This simply begs the question against the claim that A2 is false. Even if we certify independently that A2 is false, this still will not falsify A1, since A1 does not require A2. This helps us understand why the social choice framework is in no position to test the claim its practitioners often see it as proving: that the analogy between collective and individual agency is flawed because collectivities cannot be said to share the individual property of having a will. Plott's claim that Arrow's theorem "demonstrates" the fallacy of treating collectivities like individuals cannot be sustained.

Second, adopting this line of argument results in a crucial shift in the burden of proof. If one concedes that the TUPID conditions need not apply to individual will-revealing procedures, then the case for their salience in the collective case is weakened. If it is permissible for individuals to override one or other of the TUPID conditions when they determine the content of their will, then why should it be impermissible for a collectivity to do so? We have no choice but to take the individual will as the basic primitive unit of comparison—there are no other places to look for accounts of how the will operates. But if it turns out that in determining and pursuing their own wills individuals routinely and legitimately violate the TUPID* conditions, then the case for expecting collectivities to satisfy them might be undermined. I will now explore this possibility, although the findings are neither conclusive nor complete.8

conception of the will: Many philosophers and theorists have defended views of the will that seem consistent with this one. Hobbes, for example, can be interpreted as suggesting that individuals are only able to arrive at decisions at all by violating the nondictatorship condition. In Hobbes's view, deliberation is nothing other than the process by which a sequence of values (embodied by a series of emergent appetites and aversions) compete for dominance within the mind of an agent. An individual finally wills an action when one or other of these competing values wins out. In this way, the victorious appetite can be said to dictate the decision. That "dictated" decision represents the individual's will, just as the arbitrary decisions of the sovereign represent the will of the collectivity after the social contract has instituted a Leviathan. So it is perfectly possible to defend a notion of the will that violates one or other of Arrow's conditions. On this point generally, see Mayo 1956.

⁸ I am not the first to suggest this general strategy of analysis. Hurley (1989, 234-41) explores a similar line of argument. But I find her argument unsatisfactory. Hurley accepts P^* and D^* as appropriate conditions on individual deliberation but rejects U^* and I^* . To my mind, U^* is the one condition that does make sense in the individual case (see Steedman and Krause 1986, 208), so my own arguments will

target P^* , I^* , and D^* .

⁷ The point here is precisely not that this results in an indefensible

RECONSTRUCTING THE INDIVIDUAL WILL

Thus far I have argued that in order to be self-governing, societies and groups need some procedure for certifying that some policy fulfills or conforms to its own view of what should happen. I maintained that such a procedure must be independent of procedures designed to determine the content of the common good. Correctly discerning the common good is one thing, and fidelity to society's own judgment is another. The latter matters more in the context of self-government. To be self-governing, a group's will must authentically be its own. I will call this the requirement of reflexive authenticity.

Social choice theorists believe that Arrow's theorem undermines the possibility of such a will because they take the *TUPID* conditions to define a minimal, but essential, standard of reflexive authenticity for collective will-revealing procedures. This is clear from the justification social choice theorists normally offer for the critical *P*, *I*, and *D* conditions. They argue that when these conditions are violated, social choice is not determined by voters' own judgments but is instead an artifact of the aggregation method (Riker 1982, 117–9). This is a technical way of expressing the demand that procedures for determining social choice should not preempt citizens' own choices. *P*, *D*, and *I* comprise social choice theory's test of reflexive authenticity.

But do these conditions represent the only reasonable standard of reflexive authenticity in the context of self-government? Perhaps there exist other reasonable interpretations of reflexive authenticity that are inconsistent with P, D, and I. I have suggested that we might seek such alternative conceptions by questioning the claim that analogous conditions $(P^+, D^+, \text{ and } I^+)$ are essential constraints on individual will-revealing procedures, although many theorists have considered this claim (Roemer 1996, 25-6; Steedman and Krause 1986, 207-10). But if it is wrong, understanding why might allow us to reconstruct a notion of a popular will that is immunized against the threat posed by Arrow's theorem. We might learn why violating one or other of these conditions is consistent with an appropriate test of reflexive authenticity, thus undermining the basis for the social choice objection to the idea of a social or popular will.

How might one call P^* , D^* , and I^* into question? It is tempting to focus on I^* . As is well known, I^* prohibits (among other things) cardinal rankings of alternatives and thus rules out claims about the relative intensity of several emergent preferences. But surely individuals should be permitted to take such information into account when they deliberate about their choices? This is certainly right, but in the present context the objection is insufficient. Relaxing the requirement of ordinality is unlikely to help us reconstruct a viable account of will formation for two reasons.

First, intensity of preference may predict behavior, but the content of one's will is another matter. Prima facie, there is no reason to expect that the content of one's will ought to be considered a simple function of the intensity of preferences, or of behavior. Our intuitive concept of the will allows, for example, that it is often weak relative to intense desires, even that it can be "betrayed" by intense temptations and actions prompted by them. This suggests that even if we had a viable measure of intensity (itself doubtful), that variable would not predict, or stand in any determinate relation to, the content of one's judgments about one's will.

Second, we must remember that we are investigating the individual will not for its own sake but for the purposes of illuminating possible collective will-revealing procedures. Taking into consideration the intensity of citizens' preferences will only be useful in the latter context if we have some interpersonally applicable standard of intensity. But there is overwhelming agreement among economists and social choice theorists that interpersonal cardinal comparisons of utility are meaningless (indeed, many think the same is true of intrapersonal comparisons). This consensus might be misguided, but relaxing I^* 's requirement of ordinality will help us reconstruct an account of the collective will only if we can defeat the argument that interpersonal comparisons of intensity are meaningless. This route seems unpromising, and it is certainly unlikely to persuade a social choice theorist.

In what follows, I sketch a more promising line of argument against P, D, and I. It hinges on the idea that practical deliberation about how to be true to oneself has a characteristic depth structure that is incompatible with the TUPID model of the will. I follow a number of philosophers in using the hierarchical metaphor of orders of desires, preferences, volitions, and reasons to explicate this important dimension of will formation. To elaborate the point, I make extensive reference to Frankfurt's (1988, 11–26) classic, "Freedom of the Will and the Concept of a Person." I use Frankfurt largely for reasons of convenience and ease of exposition; I do not necessarily endorse his views on the definition of persons or the subject of free will.

Consider the case of the tempted spouse, who finds herself contemplating infidelity because of three distinct emergent desires. First, her husband no longer satisfies her appetite for sexual experimentation and variety; sex within her marriage has become routine and has lost its earlier sparkle. Moreover, she is strongly attracted to a colleague at work, who has given strong indications of a reciprocal interest. Second, her husband cheated on her three years ago, and she has harbored a latent desire for revenge ever since. Third, the colleague is the tempted spouse's boss, and she has reason to believe that a sexual relationship with him will advance her career. Although the tempted spouse experienced emergent desires in the past (e.g., overwhelming sexual interest in her husband) that would rank fidelity over infidelity, no such desires are present now. Her emergent desires unanimously recommend infidelity, but the tempted spouse still might decide, in the face even of this unanimous recommendation, to refrain. The feature in virtue of which this is possible is the capacity for forming what Frankfurt calls "second order volitions."

Frankfurt (1988, 16) claims that we do not merely experience emergent first-order desires of the sort that dominate the mind of the tempted spouse. We also have the ability to form second-order desires, that is, desires to have or not to have certain desires. A second-order desire becomes a second-order volition when a person desires that a certain (first-order) desire move, or not move, them to act. A second order volition is, therefore, a desire to be moved or not to be moved to action by a certain desire or set of desires.9 By virtue of this capacity, the tempted spouse may choose not to identify her will with her emergent first-order desires. It is important to emphasize that this does not imply she will successfully battle these temptations; she may give in to them. The point, however, is that even if her unanimous first-order desires cause an act of infidelity, this action does not necessarily receive the blessing of her will. It is more accurate to say that temptation caused her to act against her will, which will be reflected in the selfrecrimination, shame, and guilt likely to follow her

What sort of reasons might agents have for countermanding or even disowning their first-order desires by refusing to identify them with their will? Very roughly, the most obvious can be collected under the general category of the personal ideal. A personal ideal here refers to any sustained intention, aspiration, hope, or plan to become a certain kind of person or to live up to a certain exemplar. The tempted spouse may refuse to identify her will with her emergent desires because she is antecedently committed to "being a good spouse" or "being a good Christian." If those ideals demand that agents not be moved by lust, vengeance, greed, and so on, then people who identify with those ideals may try to renounce the disqualified desires. One reason to affiliate such ideals with one's "will" is to encourage vigilance toward motivations that might deflect or undermine one's resolve to be a certain kind of person. By refusing to identify her first-order desires with her will, the tempted spouse is trying to do just this; and her will to realize whichever personal ideal is operative in her case is instantiated in the formation and pursuit of certain second-order volitions about emergent desires.

Frankfurt's account of second-order volitions allows one to distinguish between two different ways in which agents may fail to generate or be in a position to pursue their own will. First, they may fail to form second-order volitions at all; Frankfurt calls them "wantons." It is vital to note that wantons may have second-order desires, and they may have the capacity to deliberate. The distinctive feature of a wanton is "mindless indifference to the enterprise of evaluating his own desires and motives"; the wanton may experience the second-order desire to suppress his first-order desire for sex or drugs, but he is indifferent as to which should win out. It follows that a wanton could not be self-governing in Frankfurt's sense because he could not care about

fulfilling any personal ideals of the sort sketched above. Second, as illustrated by the case of the tempted spouse or Frankfurt's (1988, 16–9) example of an unwilling addict, an agent may be capable of forming a will, but it does not follow that the will is effective in generating action.

The cornerstone of a Frankfurtian will-revealing procedure, then, is a higher order review of currently emergent first-order preferences. Agents seeking to arrive at an all-things-considered judgment as to the content of their will, given a variety of rankings based on emergent first-order desires, must ask a version of the following question: If I allow my will to be determined by emergent preferences of this particular character, will I be able to think of myself as living up to some personal ideal with which I identify? If the answer is "no," the agent may disregard the recommendation. There are two things to note about this test. First, it can legitimately claim to be one of reflexive authenticity: It reveals whether agents are being true to themselves by following one preference or another. Second, it does not evaluate emergent preferences by directly assessing their recommended rankings. Instead, it assesses the character of the values generating these rankings and their relation to some operative personal ideal. Agents can disregard an emergent preference on this basis without thinking that they should ultimately repudiate the ranking it recommends.

This reconstruction of a Frankfurtian will-revealing procedure raises basic questions about the credentials of P^* , I^* , and D^* as necessary conditions for such a procedure. These conditions conflict with the Frankfurt model because they interact in a way that forces one to treat emergent preferences as social choice theorists propose to treat voters: Each is entitled to equal voice and weight in the amalgamation process. But the Frankfurt model reveals difficulties with this assimilation. Consider again the predicament of the tempted spouse. If she believes that P^* and I^* are appropriate expectations to place on the process by which she determines the content of her will, she presumably will have to identify with the course of infidelity, since this is what her emergent desires unanimously recommend.

Moreover, strictly speaking, considering second-order assessments of the desirability of living in accord with currently emergent desires is ruled out by I^* . The reason is that when the tempted spouse invokes her second-order volition as a reason for disregarding her first-order rankings, she is choosing between fidelity and infidelity precisely on the basis of a preference between alternatives that I* deems "irrelevant." I* requires that agents' final orderings be independent of information concerning alternatives not in the set of alternatives under direct consideration. In the Frankfurtian procedure, the tempted spouse reaches a final judgment about fidelity because of the way she ranks two quite different alternatives: a life led in accordance with greed, lust, and vengeance versus a life organized around different motivations. But these two possible modes of life are not themselves members of the set of

⁹ It seems possible in principle that second-order volitions may be capable of producing, or causing one to have, particular first-order desires. See, for example, Raz 1986, 32–3.

alternatives under direct consideration, a set that includes only fidelity and infidelity on this specific occasion

It is tempting to object that the tempted spouse's second-order volition to disregard her first-order desires can itself simply be counted as an emergent preference for fidelity over infidelity, on a par with the other first-order emergent preferences. On this supposition, it would no longer be true that the tempted spouse's emergent desires unanimously recommend infidelity over fidelity, since there is now an additional preference for fidelity. This objection misfires in two ways, however. First, stipulating that the second-order volition counts as an emergent preference for fidelity may allow the Frankfurtian procedure to satisfy P^* , but only by raising a new question about D^* . D^* requires that there be no criterion or emergent preference dimension such that it determines the final ranking regardless of the rankings recommended by other emergent preferences (see Riker 1982, 118). But if we count the second-order volition as a direct preference for fidelity over infidelity and the tempted spouse opts for fidelity over the objections of all her other preferences, this requirement is violated. Given its special importance in the tempted spouse's self-image, the personal ideal of "spouseworthiness" functions in just such a "dictatorial" way in the formation of her will. But in combination with I^* and P^* , D^* denies this sort of special privilege to particular preferences. Instead, these conditions hold will formation hostage to a principle of "one desire, one vote." As the tempted spouse illustrates, however, the process of will formation is not necessarily well captured within the terms of this principle. Deliberation about the content of one's will and about how to be true to oneself often is precisely and legitimately about which preferences to privilege over others and about which alternatives are relevant in a particular instance. P^* , D^* , and I^* take these issues off the deliberative agenda by deciding them in advance according to an arguably inappropriate principle of equal consideration.

This hints at the second way in which the objection misfires. The objection simply stipulates that we assimilate second-order volitions and first-order emergent rankings of the alternatives. It may well be possible to retrieve a rationale for the TUPID* conditions once we make this stipulation, but it begs the critical question of whether we must view second-order volitions in this way. If this stipulation is independently implausible (because it fails to detect relevant differences between these two kinds of emergent preference), then so much the worse for the TUPID* model of the will. And the stipulation is implausible for this reason. Second-order volitions cannot simply be assimilated without qualification to other first-order rankings of the alternatives. A second-order volition not to be moved to X (where Y is some alternative) when prompted by first-order desires A, B, and C is not adequately described as a preference for Y over X. There may be other first-order desires (P, Q, R) that, if emergent, also would recommend X but to which the operative second-order volition has, as it were, no objection. This is hard to see

in the tempted spouse example, because it is difficult to imagine "spouseworthy" motivations for infidelity, but not in other cases. John may choose not to date Sarah because he thinks his desires for doing so are suspect (lust, a desire to get back at her current husband, wanting to access Sarah's millions), but he remains open to the possibility that other desires for going out with Sarah (e.g., true love), if they emerge, could be allowed to determine his will.

This does not mean that the tempted spouse's eventual will cannot be seen as expressing a certain kind of desire to refrain from infidelity. That description remains available, subject to an important qualification: The tempted spouse's eventual desire to refrain from infidelity is the result of a deliberative assessment of her emergent desires on this occasion, not one of the initially emergent desires for or against fidelity. Appealing to the ideal of spouseworthiness and associated second-order volitions is a method for arriving at a final judgment, and the outcome of this appeal can legitimately be described as a desire to refrain from infidelity. But this does not mean that in the first instance the second-order desire is itself a desire for or against fidelity. Rather, it is essentially a desire not to be the kind of person who acts on the sorts of motivations implicated in the first-order rankings of fidelity and infidelity.

This is not to deny that the desire to live up to the operative ideal is itself an emergent desire, but it only ranks fidelity over infidelity indirectly, by rejecting the motives on which the initially unanimous first-order recommendation is based on this occasion. Assessing the relation between one's currently emergent firstorder rankings and some privileged personal ideal is surely a perfectly legitimate way to process one's initially emergent preferences into a final judgment about one's will on a given occasion. As long as we take P^* , I^* , and D^* seriously, however, we must regard such a procedure with suspicion, for these conditions prohibit agents from assigning any greater weight to second-order volitions than to any other ranking. Yet, flattening out the will in this fashion arguably misrepresents the special character and legitimate role of privileged second-order volitions in the formation of the will. Substantive doubts of this sort cannot be removed simply by stipulating a priori that this compressed model of the will is the correct one.

RECONSTRUCTING THE COLLECTIVE WILL

I have called into question the appropriateness of P^{\bullet} , I^{\star} , and D^{\star} as conditions under which individual agents determine the content of their will, given emergent desires or criterial rankings of the alternatives under consideration. Can the lessons of this analysis be extrapolated to the case of collective self-government and, in particular, democratic self-government? At first sight, this seems unlikely, because I have claimed that it is problematic to treat agents' emergent preferences as if they were voters expressing judgments entitled to equal consideration. But this is not so problematic in the collective case, in which we are dealing precisely

with voters' judgments, and to which the democratic principle of equal consideration seems entirely appropriate. Perhaps the argument I have given simply shows that the individual psyche is typically not organized according to democratic principles. But if a democratic polity is just a group of individuals whose own views about public policy must be weighted fairly, then a presumption in favor of equal consideration may seem to follow very naturally, and with it a cogent rationale for *P*, *D*, and *I*. It is because these conditions seem to express a norm of *democratic* reflexive authenticity that social choice theory is so disturbing to conceptions of democratic self-government.

I will now show how the Frankfurtian argument offered above helps us see why P, D, and I may not be essential requirements for any reasonable standard of democratic authenticity. The discussion of second-order volitions questioned the requirement that the individual will depend exclusively on the profile of currently emergent preferences without any assessment of their character in relation to operative ideals. Does this proviso carry over to the collective case?

Consider the case of a jury in a criminal trial, as that institution is currently understood in common law jurisdictions. Suppose that initially the jurors are unanimously in favor of conviction, but upon deliberation it emerges that this unanimity is largely an artifact of prejudice, tendentious interpretation of the evidence, and disregard for the reasonable doubt standard. Under these (hardly exotic) conditions, the jurors might reasonably decide that to permit their joint will to be determined by these initially emergent preferences would fall short of the ideal of juryhood that defines their association. In that sense, the verdict implied in the initial consensus could not represent their will qua jury. But at this point the jurors need not conclude that they will eventually acquit the defendant. Their rejection of the original recommendation to convict was not based on a direct judgment of the proper verdict but on an indirect assessment of the way it was reached. No definitive conclusion about the proper verdict can be inferred at this stage. The jury simply resolves to continue the discussion until it reaches a verdict on terms compatible with a certain ideal of how juries ought to make decisions. Suppose that eventually it votes unanimously for acquittal after a sincere effort to apply the reasonable doubt test.

Keeping this example in mind, suppose that we must determine rules and conditions under which the votes of a jury can genuinely be described as expressing a jury's will. Must we accept P, D, and I as appropriate conditions? If so, we could not make any clear distinction between the two votes reached by the jury in the example. Both the initial vote for conviction and the later vote for acquittal are unanimous, and accepting either is compatible with P, D, and I. From the viewpoint of the TUPID model, the only salient difference between the two votes is the time at which they occurred and the fact that at those moments the pattern of emergent preferences was different. But P, D, and I by themselves give us no basis on which to prefer one to the other, apart from the Hobbesian

ground that the later unanimity immediately preceded the moment of resolution and so was contingently decisive. But the jury need not have changed its mind. Had it not done so, by the lights of P, D, and I, the earlier decision could have stood equally well as the jury's will.

It is not obvious that this is the only conceivable or reasonable standard of reflexive authenticity for juries. From another point of view the first unanimous verdict represents the jury's will less successfully than the second, but this perspective will elude us as long as we think of a jury as nothing more than a collection of separate individuals free to use whatever criteria they wish to determine their own view of the appropriate verdict. If this is what a jury is, then P, D, and I will seem perfectly appropriate, and the failure of these conditions to discriminate between the two verdicts becomes unproblematic. For on this understanding, a jury is simply an empty vessel whose character is determined entirely by the preferences of the individual jurors who happen to make it up at a given moment. Since both unanimous verdicts in the example represent them equally well (at different times), there is no reason to expect that one verdict represents the jury's will more successfully than the other.

Clearly, this is not the only available conception of a jury. Another defines it as a form of association that demands that its members be moved by certain considerations rather than others. A group could completely disregard the appropriate considerations and perhaps reach joint decisions, but it could not reasonably regard them as reflecting a will that is theirs qua jury. It would be basing decisions on considerations that are, in effect, unworthy of a jury. Indeed, in a sense they are failing to be a jury, or at least failing to behave like one. Adopting this more restrictive conception does not in any way show that the ideal of juryhood is itself worthy; jurors might have their own excellent reasons for wanting to subvert conventional legal practice. But as long as that ideal is partly definitive of a jury (for good or ill), a standard of reflexive authenticity for juries can reasonably demand that jurors take that ideal seriously. Moreover, it seems clear that the jury in the example fulfills this expectation. When they rejected the initial verdict, jurors did so because they reflected upon their initially emergent preferences and found their character is inappropriate given their self-image as a jury. Insofar as they aspired to juryhood, they had to conclude that their first verdict could never count as their will and must be revised, even though unanimous. Although P, D, and I do not disallow this revision, they also do not require it; these conditions could allow the first verdict to count as the jury's will. But a standard of reflexive authenticity based on the alternative conception of juryhood might well require the jurors to disallow the first verdict, so that alternative view must exclude P, D, and I.¹⁰ It follows that if this alternative

¹⁰ Suppose, for example, that after the first unanimous vote, the jury holds a second vote on whether to discuss the verdict further or let the recommendation stand. In this second vote, all but one agree to let the conviction stand, because they want their jury duty to be over

conception is reasonable, then we have found at least one collective will-revealing procedure in which relaxing the *TUPID* conditions is innocent.

One might object that there are fundamental differences between a jury and the sovereign electorate of a purportedly self-governing democracy. There is some truth to this: Directing democratic debate about public policy along the narrow lines defined by a judge who instructs a jury to disregard all criteria apart from the reasonable doubt standard would surely impinge unduly upon democratic freedoms. Moreover, in the jury example constraints are imposed externally by the judge and the wider legal apparatus in which the jurors find themselves immersed, but the idea of democratic self-government seems to require that any relevant restrictions be imposed from within.

The force of these points is easily exaggerated, however, particularly if we draw an unnaturally sharp line between procedure and substance in the context of democratic practice. Stressing the way in which democracy asserts the priority of certain decision procedures over substantive political viewpoints can obscure the way in which democratic procedure can itself function as a substantive social ideal. That social ideal need not specify any particular view about the goals of public policy. But, as in the jury example, it unavoidably defines a certain ideal about the terms on which certain policy alternatives are to be identified as the will of a democratic public. To the extent that citizens represent themselves as members of a collectivity with the distinctive character of a democratic public, they may reasonably impose restrictions on the range of firstorder values and motivations that could in principle determine their joint will. Moreover, the justification for such restrictions need not be based upon an elaborated and defensible theory of the public's best interests, or of the common good. To establish that such a democratic public is self-governing, it would be necessary only to justify restrictions on the following more slender ground: They are a necessary condition for plausibly ascribing to the authors of the social will the distinctive characteristics of a democratic public.¹¹ If citizens see themselves as members of such a public, they would be untrue to their collective character if they were to ignore such restrictions.

These restrictions will vary according to the content of the relevant democratic ideal, but it is not difficult to imagine likely candidates. Excluded motivations might include, minimally, and formally: determining votes by all consulting the same oracle and following its directives or by tossing a coin. More substantively, they might include ranking alternatives entirely on the basis of judgments about irrelevant features of the people

and done with. In our example the lone holdout is right to think that the initial vote, albeit unanimous, may not represent a will that is theirs qua jury, so a will-revealing procedure based on our alternative understanding of juryhood might require that his single vote determine their will as a jury at that moment—in this case to continue deliberation. But this seems to require relaxing D.

who advocate them (e.g., skin color, ethnic origin, and religious affiliation) and determining one's vote on the basis of criteria that give absolutely no weight to, or completely discount, the values of free and open debate, compromise, accountability, equal consideration, and transparency. These restrictions neither amount to nor necessarily rest on a particular view of the common good or the substantive goals of public policy, but a society that ignores these desiderata clearly fails to meet expectations implicit in the idea of democratic agency. As in the jury example, citizens might reasonably conclude that when a society acts on the basis of such motivations and values it fails to live up to the ideal of an open, inclusive democratic society.¹² Unlike the jury example, it is not obvious that these standards are necessarily "externally imposed" upon citizens. They simply may be embedded deeply in the institutional history and discursive practice of a given polity, such that it would seem very unnatural to regard citizens who apply them as appealing to anything alien or extraneous.13

The central point is that practices of compromise, open debate and inclusion, and the associated deliberative commitments to values such as fairness, consideration, and freedom are partly constitutive of democratic agency. To the extent that restrictions essential to these practices fail to operate, one may legitimately doubt whether the results of the process can qualify as the will of a group with the distinctive character of a democratic public. By contrast, P, D, and I involve an interpretation of democratic authenticity that pays no attention to the character of the motivations behind individual votes and preferences. The only information

Or they are characteristic of some polity that aspires to some more substantive social ideal that is nested within and compatible with democratic ideals and procedures (e.g., "the American way").

¹² The relevant restrictions would therefore be what Goodin (1986, 78) helpfully calls "input filters."

¹³ This may imply a certain conservative bias, in the sense that embedded social ideals (such as democracy) require citizens to acknowledge an overriding allegiance to the extant practices, cultures, and institutions in which such ideals are latent. But perhaps that is necessary in order for a political group to have a persisting identity over time such that it can be in principle the subject of its own destiny. This tends to vindicate the Aristotelian idea that a society's constitution is both the source of a local consensus on certam social values and a political society's essential identifying attribute (Aristotle 1981, 176). Perhaps the real lesson of the impossibility theorems is that a social will cannot emerge in a social vacuum: There must be at least some nonarbitrary constraints informing citizens' joint self-understanding as a society organized around certain ideals and values. Only then can they see themselves as participants in an overriding political identity to which their joint decisions and actions may (or may not) be loyal. But note that constraints of this kind are crucially different from those imposed by the various forms of the General Will argument we considered earlier. Under that argument, the constraints are imposed by some independently authoritative account of the common good so as to increase the likelihood that the right answer will emerge from appropriately designed decision procedures.

¹⁴ This does not mean that democratic publics must consciously take these values as their concrete goals, only that consciously or not, these restrictions must in fact shape the character of the political process. The property of acting like a democratic public may, for example, be what Elster (1986, 122–7) calls a by-product. This highlights another difference between the line of argument developed here and epistemic populism. In the latter view, citizens are required to embrace consciously a particular collective goal (some substantive view of the common good) as part of the political process. In my view, this need not be so.

that is allowed to count concerns patterns in the list of individual rankings offered by citizens. This is the same "empty vessel" interpretation of reflexive authenticity discussed earlier. The character of a democratic public can be whatever the preferences of its members make it. From a Frankurtian viewpoint, democratic authenticity requires second-order restrictions on the sorts of motivations and values upon which voters' judgments are based. The standard objection to such restrictions is that when they are applied, "social choice is based as much on the restriction[s] as it is on individual judgments" (Riker 1982, 117). The response is to insist that although such restrictions may not be based on individual judgments on specific occasions, observing them may nevertheless be a necessary condition for certifying that the individuals expressing those judgments comprise a group with the distinctive character of a democratic public. The criteria for attributing to a collectivity a democratic character automatically entail various restrictions on the range of motivations allowed to constitute its will. Once we see this, we can dismiss the charge that such restrictions necessarily preempt democratic authenticity because they are "imposed upon" a democratic public as if from outside. Frankfurtian restrictions are presupposed in the very concept of a democratic public itself. In a sense, they cannot be imposed; if they are not operative, there simply will be no democratic public on which to impose. That is why they can legitimately be regarded as essential to an appropriate test of reflexive authenticity for democratic publics.

Given this, citizens who think of themselves as members of a democratic public have reasons to reject P, D, and I as criteria of democratic authenticity. Frankfurt's terminology helps illuminate what is at stake: For a democratic public to endorse P, D, and I as its criteria of reflexive authenticity would institutionalize wantonness. In virtue of its accepted self-image, such a public would have a second-order desire to fulfill its aspiration to be genuinely democratic. But the effect of endorsing P, D, and I would be to deny any special privilege to that ideal in the formation of its will. Such an authorization would instantiate wantonness by undermining the basis for any plausible discrimination between the fulfillment of society's aspiration to be democratic and those first-order preferences or emergent desires that might signify its betrayal.

Replacing P, D, and I with a more restrictive criterion of democratic authenticity does not itself guarantee that such betrayals will not occur (although it might imply institutional—perhaps in particular constitutional—mechanisms to disable or impede them). But this does not affect the key theoretical point that from the perspective of an ideal of democratic self-government it is irrational to institutionalize wantonness. Surely, there is a fundamental difference between a society whose aspiration to be genuinely democratic has been betrayed in practice and a society that has institutionalized a license for this kind of betrayal. It is the difference between Frankfurt's wanton and Frankfurt's unwilling addict (or the tempted spouse). From the Frankfurtian perspective, Arrow's theorem becomes

much less disturbing to the idea of democratic selfgovernment. The claim that the *TUPID* conditions cannot result in a coherent will can now be interpreted simply as a formalization of the claim that wanton collectivities, like wanton individuals, are systematically unable to form a will.

CONCLUSION

Clearly, these arguments are not intended as a solution to Arrow's theorem on its own terms, if by that one means an all-purpose algorithm for guaranteeing that voting procedures will not result in cyclical preferences. My argument also is not meant as a refutation of the theorem; I do not believe that Arrow's theorem can be refuted. Rather, I have attempted to put the impossibility theorem in proper perspective within the context of self-government. Social choice theorists have made strong claims that Arrow's theorem establishes the logical absurdity of the notion of a popular democratic will. That is only true if the expectations imposed by social choice theory are necessary conditions for any reasonable will-revealing procedure. I have suggested that this assumption is dubious. We may have been looking in the wrong place for democratic will-revealing procedures and tacitly relying on an unreasonably stringent criterion of collective self-government.

The specification and application of my broader understanding of will formation are complex matters and face many difficulties. The result may not be an understanding of the social will with the formal elegance and rigor offered by the social choice model. That would be a real loss. But there is also the potential for compensating gains. A wider notion of the social will may illuminate a number of issues that the social choice model leaves obscure. In closing, I offer three thoughts along these lines.

First, many insights are offered by social choice theorists. I merely claim that the model of will formation presupposed by Arrow and his successors is not uniquely reasonable and appropriate to all choice situations. Furthermore, some choice situations may not be governed by relevant second-order volitions. In such cases, the TUPID conditions may yet be appropriate, and it will follow that there is no way to determine the content of the social will with regard to the specific alternatives under consideration. Conversely, the presence of second-order volitions may cause preferences over alternatives to have the property of single-peakedness (Riker 1982, 128). It has long been understood that where this property exists, the Arrow problem does not arise. Integrating social choice theory into the broader perspective proposed here may allow us to define more sharply the preconditions for the formation of a social will.

Second, the perspective offered here brings into the foreground questions about the interface between second-order volitions that define citizenship and those that operate in other arenas. For example, individuals have personal ideals, and the ideals of democratic self-government also make demands on them. Different personal second-order volitions might threaten or

facilitate the organization of a democratic will, and it is important to know which. Moreover, semipublic institutions such as political parties form wills using their own characteristic second-order volitions. Perhaps personal identification with such ideals being a "loyal Republican" or a "faithful trade unionist," and the sanctions imposed by such institutions for disloyalty, may help reduce or increase conflicts between personal ideals and ideals of citizenship. Understanding the role of semipublic institutions might tell us much about the conditions under which a public will can be organized. There is also the related question of the range of motivations affiliated with particular parties or groups that a given ideal of democratic citizenship will tolerate: Unfortunately, the people of Austria and Northern Ireland have recently found themselves embroiled in just this issue. Arguments to the effect that certain kinds of parties, and the values that identify them, are "beyond the pale" or inimical to the conduct of democratic decision making may be essential to the practice of democratic self-government.

Third, the Frankfurtian position preserves the idea, deeply embedded in ordinary usage, that wills, once identified, may nevertheless be betrayed in practice. Drawing on Aristotle, Hurley (1989, 136-7) gives a fascinating illustration of how this idea can have collective applications. Members of a democratic public may "will" an end to racial discrimination (perhaps because they take this to be mandated by democracy itself), yet find that their own will is frequently betrayed in their interactions as private citizens (de facto discrimination, powerful groups using their favored position to circumvent or exploit loopholes in relevant statutes). The line of argument opened here provides a framework for analyzing this kind of phenomenon and can help us perceive a politics of the will in the characteristic discourse that develops around the attempt to impose legal and social controls on citizens'

These suggestions are sketchy and present serious difficulties, but there is no reason to suppose a priori that these difficulties are impossible to overcome. The social choice theorists suggested that the notion of a collective will is indeed an a priori impossibility. If the argument of this article has succeeded in dispelling these alleged impossibilities and in opening up a viable line of argument, the progress, though modest and incomplete, will nevertheless be real.

The Fear of Death and the Longing for Immortality: Hobbes and Thucydides on Human Nature and the Problem of Anarchy

PETER J. AHRENSDORF Davidson College

Recent challenges to the modern secular state invite us to reexamine the arguments made by its theoretical founders, especially Hobbes. Hobbes argues that the desire for security is the most reliable and rational desire of our nature, and the state based on satisfying that desire is fully in harmony with human nature and therefore fully capable of solving the problem of anarchy. I will examine his argument that anarchy, although in some sense the natural human condition, can be overcome once and for all through political institutions that ensure the rational fear of death will control humans' destabilizing hopes and longings for immortality. I then turn to Thucydides, the classical thinker whom Hobbes admired most and who seems closest to Hobbes in outlook, and consider his more somber thesis: Because human hopes for immortality are more powerful than the fear of violent death, anarchy will return over and over again.

uring the past quarter-century, powerful challenges have emerged to that hitherto mighty Leviathan, the modern secular state. In the Islamic world, India, and Israel, religious movements have weakened and in some cases overthrown modernizing, secular governments.1 In the former Soviet Union and former Yugoslavia, ancient ethnic and religious loyalties and hatreds have crippled and in some cases shattered state power.2 More generally, the modern state, which Nietzsche (1967, 160) described as "the coldest of all cold monsters," seems to be losing its hold over the hearts and imaginations of postmodern human beings. Throughout much of the world there seems to be an antipolitical mood, an anarchism of the heart, which manifests itself in different ways but is recognizable to all.

During the past few years, observers in America and Europe have written of "The Coming Anarchy" (Kaplan 1994), "Ethnarchy and Ethnoanarchism" (Tamas 1996), Pandaemonium (Moynihan 1993), and The Balkanization of the West (Mestrovic 1994). They wonder whether the age of the modern state is over and whether we are returning to a premodern epoch (Hassner 1995, 338–9), a world "in which the classificatory grid of nation-states is going to be replaced by a jagged pattern of city-states, shanty-states, nebulous and anarchic regionalisms" (Kaplan 1994, 72), a world in which the primary problem of security "is not the desire for power or expansion, but rather the breakdown of States" (Delmas 1996, 7).³

These challenges invite us to reexamine the arguments made by such theoretical founders of the modern state as Locke, Montesquieu, and above all Hob-

bes.4 The modern state was based not on humans' hopes for salvation or their desire to fulfill their political natures, but on their fear of death and desire for self-preservation. The thesis of Hobbes in particular is that this desire for security is the most reliable and rational desire of our nature, and any state based on satisfying that desire is, unlike premodern forms of political organization, fully in harmony with human nature and hence fully capable of solving the problem of anarchy. I will explore Hobbes's argument that anarchy can be overcome once and for all through political institutions that ensure the rational fear of death will control destabilizing hopes and longings.5 Then, for a critical perspective on this argument, I will turn to the classical thinker Hobbes admired most, Thucydides, who believed that individual statesmen and regimes can effectively address the problem of anarchy to a considerable extent, but anarchy will nevertheless return repeatedly as long as human nature remains the same.6 I conclude that the fundamental reason Thucydides does not share Hobbes's hope that the problem of anarchy can be solved once and for all is that he does not share Hobbes's hope that the fear of violent death can lead humans to master their destabilizing hopes. Thucydides argues instead that human hopes, especially for immortality, tend to overwhelm human fears, even of violent death. Hobbes is hopeful precisely because he believes that the power of hope can be tamed by fear, whereas Thucydides is not

But consider Kraynak 1990, 23 n. 15 on Hobbes's admiration for Diodorus Siculus.

hopeful precisely because he believes hope is invincible.

A number of scholars overlook this fundamental difference between Hobbes and Thucydides. Cogan (1981, 1987) contends that "the two share an almost identical view of the nature of mankind, of its motives, of the origin of those motives, and of the usual result when this nature is allowed a free rein to operate."7 Other scholars, who have noted that Thucydides is less hopeful than Hobbes in his view of the problem of anarchy and human nature, agree with Pouncey (1980, 43): "The principal difference between Hobbes and Thucydides on this point is the difference between a political theorist and a historian."8 Yet, by claiming that his work will be useful for those who seek clarity about not only the past but also the future and is therefore "a possession for all time," Thucydides explicitly makes the theoretical claim on behalf of his book that it will reveal the permanent and comprehensive truth about human affairs and human nature (Thucydides 1963, History, 1.22.4).9 He thereby indicates that he is, in a crucial sense, a political theorist.

I maintain that the principal difference between Hobbes and Thucydides is their theoretical disagreement over whether the fear of violent death or the desire for immortality is the stronger element within human nature. Orwin and Slomp offer especially helpful observations concerning this matter. Orwin (1988, 845) remarks that "Thucydides knows better than to anticipate Hobbes in hoping for too much from fear," and Slomp (1990, 574; see 581, 586) points out that "Hobbes refuses to share the pessimistic Thucydidean position according to which, as a rule, hope of success prevails over fear of failure." I argue, however, that the reason Hobbes and Thucydides disagree over whether the problem of anarchy can be solved lies in their disagreement over whether the destabilizing hope for immortality in particular—that is, the hope that one can somehow overcome one's mortal nature and live on after death—can be controlled by the fear of violent death.

HOBBES: THE FEAR OF VIOLENT DEATH AND THE ESCAPE FROM ANARCHY

Even though Hobbes believes the natural condition of human beings is the war of all against all, he also believes it is possible for humans to escape that state of "meer" nature once and for all. "If the moral philosophers had as happily discharged their duty" as have the geometricians,

I know not what could have been added by human industry to the completion of that happiness, which is consistent with human life. For were the nature of human actions as distinctly known as the nature of quantity in geometrical figures, the strength of avance and ambition, which is sustained by the erroneous opinions of the vulgar as touching the nature of nght and wrong, would presently faint and languish; and mankind should enjoy such an immortal peace, that... there would hardly be left any pretense for war (Hobbes 1972a, Epistle Dedicatory, 91, emphases in original).¹⁰

Hobbes suggests here that the problem of anarchy, at least on the domestic plane, can be solved definitively. According to him, anarchy is not a necessary consequence of human nature but, rather, an accidental consequence of the "erroneous opinions" of particular human beings.

Though nothing can be immortall, which mortals make; yet, if men had the use of reason they pretend to, their Common-wealths might be secured, at least, from perishing by internall diseases.... Therefore when they come to be dissolved, not by externall violence, but intestine disorder, the fault is not in men, as they are the *Matter*; but as they are the *Makers*, and orderers of them (Hobbes 1982, xxix, 363, emphases in original).¹¹

Although the state may not, perhaps, ever be free of the threat of foreign war, 12 it can "be secured" from the threat of civil war if only it is properly ordered by human beings who have, thanks to Hobbes, surpassed the moral philosophers in their understanding of human nature. Insofar as "at least" civil war is avoidable through human efforts, then, it is indeed possible, according to Hobbes, for mortals to create an "immortal peace." In order to understand how this is possible, let us turn to Hobbes's account of human nature.

What distinguishes man from the other animals, according to Hobbes, is foresight and hence the awareness of death. Man is the mortal being who is aware that he is such. The consequence of this awareness is constant anxiety, "a perpetual solicitude of the time to come," and hence a tendency to live, as it were, in the future (Leviathan, xii, 168-9; cf. Strauss 1959, 176, n. 2). Just as "man is famished even by future hunger," so is he tormented by future sufferings, that is, by the possibility of future sufferings (Hobbes 1972b 10.3).13 Accordingly, man not only fears death and seeks to avoid it in the here and now but also seeks to "secure himself against the evill he feares" for the future (Leviathan, xii, 169, emphasis added). He seeks not only to be secure but also to feel secure. He desires specifically to feel assured that he will continue to be secure in the future so that he may be free, not only

⁷ Brown (1987, 34; see 40) maintains that "virtually every part" of Hobbee's argument in chapters 11 and 13 of *Levathan* "finds its parallel in Thucydides." Even Schlatter (1945, 357, see 358-60, 362) suggests that "Hobbes found in Thucydides concrete examples of how human nature performs: the descriptions in the *Levathan* of how men act read like generalizations from these examples." Consider as well Connor 1984, 99.

See Pouncey 1980, 156-7. Consider Johnson 1993, 70, but see 69, 199-200; and Schlatter 1945, 357-62.

All references to Thucydides are to the Jones and Powell edition (1963). All translations are my own. See also 3.82.2, as well as 1.76-7, 2.50-3, 3.45, 4.61, 4.108.4, 5.89, 103, 105. Consider Hobbes 1975, 6-7; Bolotin 1987, 7, Orwin 1994, 3-8.

¹² But consider Kraynak 1990, 113, and see also 29, 31, 95-6, 170, 186, Pangle 1976, 339-40; Tuck 1996a, xxvl. See as well Kateb 1989, 379; Strauss 1953, 194.

¹³ Hereafter cited as *De Homme*; all references are to the Gert edition (Hobbes 1972b).

from death but also from the gnawing fear of death (xii, 169; consider xiii, 186). Consequently, since "the object of mans desire, is ... to assure for ever, the way of his desire," he must desire an immortal security in order to be secured absolutely and "for ever" against future evil and future death (xi, 160-1, emphasis added; see xix, 247-8). The fundamental desire of the human animal is the unlimited desire for self-preservation.

Yet, even though Hobbes sometimes goes so far as to speak of this desire as a "necessity of Nature,"14 he also acknowledges that human beings are at times willing to sacrifice their life, especially for the sake of honor or revenge.¹⁵ There, are, then, two sides of human nature: the anxious, death-fearing side and the spirited or vain, honor-seeking side (see Strauss 1952, 18; 1959, 192). Both sides lead to a state of war. Just as the proud desire for honor—namely, that others honor you more than they honor themselves-leads humans to attempt "to extort" honor from others by force, so the anxious desire for security leads humans to subdue or kill preemptively anyone who might possibly threaten their life (see Leviathan, xiii, 184-5; Kavka 1983, 309). Hobbes does not contend that these desires always lead to actual fighting, only that they always lead to the danger of fighting: "The nature of War consisteth not in actuall fighting; but in the known disposition thereto, during all the time there is no assurance to the contrary. All other time is PEACE" (Leviathan, xiii, 186; see Kavka 1983, 292). Because no society up until now has successfully "assured" or guaranteed that fighting will not arise, that is, because all societies hitherto have laid their foundations "on sand," all societies hitherto have existed, according to Hobbes's strictest definition, in a state of war (Leviathan, xviii, 233; xx, 260-1; xxiv, 296; see Johnston 1986, 213; Mansfield 1971, 104-5).

But if the threat of anarchy is rooted in human nature, then how can that threat ever be overcome once and for all, to be replaced by the security of an "immortal peace" (see *Leviathan*, xxxi, 395)? The answer, of course, is the Leviathan, that artificial state whose goal is only peace, which subordinates all other possible goals—such as justice or virtue or salvation or truth itself—to this goal, and which aims therefore at peace at any price. This state must possess absolute power as a necessary means to achieve the limited aim of peace, above all, in order to "bridle men's ambition, avarice, anger, and other Passions" through the threat of punishment. Hobbes emphasizes that the absolute power of the state cannot, by itself, establish peace, since the threat of punishment alone will not

always deter people from rebellion. Accordingly, the state must also enjoy the enlightened, moral support of the people. The people must believe, in other words, that the state has right, as well as might, on its side (see *Leviathan* xxx, 376–85).¹⁸

Yet, how can we human beings, whose vain and anxious nature leads us to anarchy, be led to embrace the artificial state, whose goal is to avoid anarchy at all costs? We must first experience the horrors of the state of war (Leviathan xviii, 236-7; xlvi, 699). According to Hobbes, the two principal natural passions of human beings are the desire for security and the desire for honor, and both passions are equally natural, but they do not both equally lead to the natural state of war. Your anxious desire to preserve yourself may lead you to kill others, but your fundamental desire is to be left alone, in peace, and this desire does not necessarily lead you into conflict with others who feel that desire. In contrast, your desire for honor does necessarily lead you into conflict with others, since in seeking honor from others you demand that other human beings, who are just as self-regarding as you are, honor you more than they honor themselves (see xiii, 184-5).19 In order to induce humans to quit the state of war, the natural desire to preserve oneself, or the fear of death, must be inflamed and instructed, while the natural desire for honor must be weakened and controlled. How is this conquest of honor-loving human nature to be achieved?

The solution to the natural state of war lies precisely in the natural state of war. For it is primarily those who enjoy security and consequently forget their primary, natural insecurity who long for honor. "All men naturally strive for honour and preferment; but chiefly they, who are least troubled with caring for necessary things And therefore it is no marvel, if with greedy appetites they seek for occasions of innovations" (De Cive 12.10). The love of honor is based on the splendid illusion, born of plenty and safety, that we should not trouble ourselves with mere life but should seek honor from others and from future generations. The long experience of comfort and security leads humans to forget their vulnerable nature, to unlearn their natural anxiety, and breeds in them that confidence and "excessive self-esteem [that] impedes reason" and threatens peace (De Homine 12.9). Hence, cruelty proceeds "from Security of their own fortune" and "Man is ... most troublesome when he is most at ease" (Leviathan, vi, 126; xvii, 226; see xxvii, 341-2). Hobbes suggests that the experience of security stifles our natural fear of death, strengthens our natural vanity and love of honor, and eventually leads to the state of war and the destruction of our security.

But precisely insofar as the blinding love of honor and, more generally, the vain, confident, noble stance toward life lead to war and insecurity, these ultimately

¹⁴ See Lenathan, rv, 209–10; De Cive, Epistle Deducatory, 90; 1.7, 2.3, 2.18, 3.9; Hobbes 1975, 577, n. 5.

¹⁵ See Levathan, xv, 210-1; xxvii, 341-2; De Cive 3.12. See also Gert 1996, 163, 165, 169-70; Johnston 1986, 50-1; Kraynak 1990, 197-200; Tuck 1996a, xxviii—xxx; 1996b, 188.

¹⁶ See Levathan, xv, 215-6; xvm, 232-3; xxiv, 297; xxxvi, 468-9, xl, 500-1; xlii, 550-1, 591; xlv, 670-1; xlvi, 691, 703; De Cive 2.1-2, 3.19. Hobbes admits that his claim that all men are equal is based primarily on the goal of peace rather than on the truth. Compare Levathan, xin, 183-4, with xv, 211 and De Cive 3.13.

¹⁷ Leviathan, xiv, 195-8, esp. 196. Consider xvii, 224-5; xviii, 232-3; Manxfield 1971, 101-3.

¹⁸ On the importance of enlightenment for Hobbes, see Blits 1989, 426-9; Johnston 1986, 91-2, 101, 120-33, 213; Kraynak 1990, esp. 112-4; Trainor 1985, esp. 356-7.

¹⁹ On this point, see Manent 1977, 55, 81; Ryan 1996, 219-22 But consider also Kavka 1983, 309.

lead to enlightenment and salvation. Hobbes maintains that "continuall feare, and danger of violent death" is a most valuable learning experience. With a gun at your head, you suddenly see clearly what counts and what does not. In a flash, you grasp the essential human situation. You see the folly of vainly disdaining mere life in favor of fame after death (De Homine 12.8).20 You see that all speech about Right and Wrong, Justice and Injustice, and especially about Finis ultimus and Summum Bonum, to be found most notably "in the Books of the old Morall Philosophers," is just talk, just "uselesse" cant (Leviathan, xiii, 188; xi, 160-1; xxxi, 407-8). And you see that the one real thing in human life—our only star and compass—is the evil of death, "the chiefest of natural evils," "the terrible enemy of nature" (De Cive 1.7; Hobbes 1889c, De Corpore Politico I.1.6).21 The state of war is for Hobbes truly a "most violent master" or teacher; by inflicting violence upon us, it teaches us to fear death most of all, and such eye-opening and mind-clearing fear is the beginning and the end of human wisdom (see Hobbes 1975, 3.82). The experience of the "calamity of a warre with every other man," precisely insofar as it "is the greatest evill that can happen in this life," "instruct[s]" human beings on the necessity of establishing a state aimed at avoiding such war at all costs (Leviathan, xxx, 376; xviii, 236-7). The state of war proves to be a blessing as well as a curse, a blessing because it is a curse. That "which is worst of all" about it is the "continualle feare, and danger of violent death." But the intense and overwhelming fear of death overpowers the vainglorious passion of humans, inclines them to peace, and leads them to consent to, and thereby embrace, the sovereign (xiii, 186, 188; xx, 251-2; xlii, 599).22 Such fear of death is the rational and the saving passion of humankind, for it makes human beings reasonable, sober, and peaceable.23 Death is the chiefest of natural evils, but the fear of death turns out to be the chiefest of natural goods. It is that passion upon which Hobbes reckons, and builds, to attach human beings to the artificial state, the Leviathan, so that they might thereby escape once and for all from the natural state of war (compare Leviathan, xiv 200 with xx, 260-1 and xxix, 363).

To be sure, Hobbes does not believe that the state should appeal exclusively to its subjects' fear of death in order to save them from anarchy. "The Passions that encline men to Peace" also include the "desire of such things as are necessary for commodious living" and "a Hope by their industry to obtain them" (Leviathan, xiii, 188). Accordingly, when arguing that the end for which the sovereign is entrusted with his power is "procuration of the safety of the people," Hobbes explains that "by safety here is not meant a bare Preservation, but also all other Contentments of life, which every man by

 20 As Manent (1977, 87) puts it: "Seule la peur de la mort delivre Narcame de ses songes."

lawful Industry, without danger, or hurt to the Commonwealth, shall acquire to himself" (xxx, 376, emphasis in original; see xxiv). Hobbes clearly encourages the sovereign to appeal to the desire for comfortable self-preservation of his subjects, but he also clearly argues that the sovereign should appeal primarily to their fear of death. "Of things held in propriety, those that are dearest to a man are his own life, & limbs; and in the next degree, (in most men,) those that concern conjugall affection; and after them riches and the means of living" (xxx, 382-3, emphasis added). Consequently, "the Passion to be reckoned upon, is Feare" of that which is "worst of all," namely, "violent death" (xiv, 200; xiii, 186; see xii, 169; xiv, 202; xvii, 223; xxvii, 343).

Hobbes's account of human nature might seem to imply that the state of war can never be escaped once and for all but will always alternate with periods of peace. It seems there is no natural order to the human soul, that neither fear of death nor vanity naturally rule, but each predominates or gives way depending on external circumstances. If the terrible experience of war strengthens our fears, weakens our vanity, and leads us to embrace an artificial state aimed at peace at all costs, then will not the comfortable experience of peace inevitably lead us to forget the horrors of anarchy, inflate our vanity, and eventually undermine the state and return us to the state of war?

Hobbes suggests that human history has been marked by cyclical war and peace but he reveals how this cycle can be broken.

If there had not first been an opinion received of the greatest part of England, that these Powers were divided between the King, and the Lords, and the House of Commons, the people had never been divided, and fallen into this Civill Warre . . . which have so instructed men in this point of Soveraign Right, that there be few now (in England,) that do not see, that these Rights are inseparable, and will be so generally acknowledged, at the next return of Peace; and so continue, till their miseries are forgotten; and no longer, except the vulgar be better taught than they have hetherto been For all men are by nature provided of notable multiplying glasses, (that is, their Passions and Self-Love,) through which, every little payment appeareth a great grievance; but are destitute of those prospective glasses, (namely Morall and Civill Science,) to see a farre off the miseries that hang over them. and cannot without such payments be avoyded (Leviathan xviii, 236-8; see xxvi, 320; xlvi, 699, emphases in original).

Hobbes indicates that the seemingly inevitable cycle between war and peace, vanity and fear, can be overcome through an instruction that artificially gives people who are at peace the lessons they would "naturally" learn from the bitter and bloody experience of war. An education enlightened by "Morall and Civill Science" can correct the natural tendency of human beings who are at peace to succumb to vanity by equipping them with the foresight—"those prospective glasses"—to see and to feel the terrible consequences of such vanity—namely, anarchy and war—without having to experience them directly. The purpose of enlightenment is to make human beings who are secure feel insecure, so that they may properly appreciate their security and

²¹ Hereafter cited as De Corpore Politico, all references are to the Molesworth edition (Hobbes 1889c).

²² See Johnston 1986, 45-6; Manent 1977, 81; Manafield 1971, 100-1.

²³ As Oakeshott (1960, xxxvi) states, "man is a creature civilized by the fear of death."

thereby continue to be secure.²⁴ "To regain a good is better than not to have lost it. For it is more rightly esteemed because of the memory of evil" (*De Homine* 11.14).

The price of objective security is subjective insecurity. The more insecure you feel, the more secure you will be. If you "enjoy" your security, then you will take it for granted, you will hope and strive for goods greater than mere security—such as honor—and eventually will lose your security. But if you feel insecure, if you feel in your bones "the continualle feare, and danger of violent death," then you will continually cherish peace and the state that provides it. "Men profit more by looking on adverse events, than on prosperity" and "men's miseries do better instruct, than their good success" (Hobbes 1975, 20). Such events and miseries teach us sober fear rather than lofty, vain hope.

Since "those imbued with no matter what opinions from boyhood retain them even in old age," and since the majority of people receive their moral opinions from the learned class, the education Hobbes proposes as the solution to the problem of anarchy must focus "wholly, on the right teaching of youth in the Universities" (De Homine 13.3; Leviathan, xxx, 384; see 376-85 as a whole). This will entail broad and deep university reform, because it will "root out" books, such as those "by all the philosophers, Plato, Aristotle, Cicero, Seneca, Plutarch," that encourage vanity, rebellion, and anarchy; in their place will be books, such as works by Hobbes and perhaps Thucydides, that promote rational fear, obedience to the state, and hence peace.25 Such an education will impose an artificial order on the naturally chaotic human soul by enabling the rational fear of death to triumph once and for all over the vain love of honor. It will thereby enable the artificial state to triumph once and for all over the natural state of war.

One may still object that a certain fear could undermine the state whose goal is peace at any price and whose premise is that death is the greatest evil: the fear of eternal damnation (compare Leviathan, xv, 200, with xxix, 371; see Johnston 1986, 98–101, 112–3). Hobbes acknowledges that "it is impossible a Commonwealth should stand, where any other than the Soveraign, hath a power of giving greater rewards than Life; and of inflicting greater punishments, than Death" and it is therefore "a thing worthy to be well considered, of all men that desire (by obeying Authority) to avoid the calamities of Confusion, and Civill war, what is meant in holy Scripture, by Life Eternall, and Torment Eternall" (Leviathan, xxxviii, 478, emphases in original). He also admits that "no man can serve two masters: nor is he less, but rather more a master, whom we believe we are to obey for fear of damnation, than he whom we obey for fear of temporal death" (De Cive 6.11). Here, too, however, Hobbes finds a solution to the problem

of anarchy and rebellion (in this case, in the name of God and the afterlife) in education.

Hobbes contends that ignorance is the primary cause of that "Feare of things invisible [that] is the naturall Seed" of religion. He proposes to remove that cause by enlightening the people, by teaching what he claims to be the truth about God and the afterlife: "The will of God is not known save through the state"; the head of state, or sovereign, alone properly determines what constitutes "Sinne"; the sovereign alone is "God's Prophet" and the interpreter of Scripture; most important, the soul is not immortal.26 At the same time, Hobbes proposes to weaken the irrational fear of divine punishment after death by enhancing, again through education, the rational fear of death, especially violent death. Insofar as education reproduces the experience of the state of nature, we will feel "the continualle feare, and danger of violent death," we will grasp the truth that death is the greatest evil, and we will worry about the afterlife as little as human beings do in the state of nature.27 In this way, Hobbes hopes that enlightenment will arm the minds and hearts of human beings against those religious beliefs and passions that threaten the state and, therewith, the peace.

Hobbes's belief that the threat of anarchy can be overcome once and for all is based, then, on his contention that the experience of insecurity inspires in humans a rational fear of death, weakens the vanity and love of honor that can lead them to despise death, and teaches them to support the state whose primary aim is to avoid anarchy at all costs. If education can artificially reproduce for human beings who are at peace the effects and lessons that ensue from the natural state of war, then it should be possible for humans always to support the state and avoid civil war. In this way, the state, that "Artificiall Man," can enjoy "an Artificiall Eternity of Life," and through it human beings can obtain that "perpetuall . . . security" they seek (Leviathan, xix, 247–8; see xxi, 272; xxix, 363; De Cive, Epistle Dedicatory 91).

SOME QUESTIONS CONCERNING HOBBES'S SOLUTION TO THE PROBLEM OF ANARCHY

A number of features of Hobbes's account of human nature and anarchy may reasonably lead one to wonder about his belief that the state is the definitive solution to the problem of anarchy. In the first place, it seems that the security provided by the state can only be "perpetuall" as long as the members of the state recognize that the threat of anarchy is perpetual. If the fear of anarchy fades, then vain hopes and longings for honor will burst forth, attachment to the state will be

²⁴ On this point see also Johnston 1986, 92-3, 101, 120-33, 213. ²⁵ De Cive 13.9, 12.3; see also 12.12; De Homine 13.7; Leviathan, 1, 87; xxi, 267-8; xxix, 369-70; xxxi, 407-8; xivi, 685-703; and Review and Conclusion, 727-8.

²⁷ See Lenathan, xiii, esp. 186; xv, 200. But consider xi, 168; xil, 169-70. Consider also Kraynak 1990, 109-11, 152, 165-6; Manent 1977, 86; Strauss 1953, 198-200.

undermined, and people eventually will return to the miseries of anarchy. But precisely insofar as the state is successful in rescuing its members from those miseries, will not their fears of anarchy inevitably fade, notwithstanding the efforts of Hobbesian educators to keep those fears strong? Will not students of Hobbes's works be especially tempted to believe that they have progressed irreversibly beyond the danger of savage civil war, given his promises of "immortal peace" and an "everlasting" Commonwealth?²⁸

One may also wonder, on the basis of Hobbes's account of human nature, whether the fundamental longing of human beings will or can ever be satisfied by the Hobbesian state. That state is based on the natural human desire for security. But humans flee the state of nature not only to avoid the danger of violent death but also to be free of the fear of violent death. The feature of the state of nature "which is worst of all" is the "continual feare, and danger of violent death" (Leviathan, xiii, 186). Tuck (1996a, xliii; see xxvi) characterizes Hobbes's political philosophy as "the grand Hobbesian enterprise of liberating men from terror." Hobbes maintains that humans turn to the state in order to escape their natural anxiety, in order to feel secure as well as to be secure (see Leviathan, xiv, esp. 192). Precisely because they long to be free from fear, and hence from the very possibility of evil and death, humans long not only to preserve themselves but to do so "for ever" (xi, 160-1). Humans establish the state and subject themselves to it "for their perpetuall, and not temporary, security" (xix, 248; see De Cive 1.15).

Yet, insofar as humans long for a complete security, insofar as they long not only to avoid violent death but also to be free of the fear of death, they clearly cannot satisfy that longing while living under the Hobbesian state. The state aims to liberate its members from fear but is itself based primarily on fear. "The Passion to be reckoned upon, is Fear," and fear "is the onely thing, (when there is appearance of profit, or pleasure by breaking the Lawes,) that makes men keep them" (Leviathan, xiv, 200; xxvii, 343). Leviathan, "that Mortall God," must inspire in its members a terrible fear of punishment (xvii, 227-8; see De Cive 5.8; Johnston 1986, 92–3). But furthermore, and more important, the state must continually inspire in its members an enlightening memory and fear of the instructive miseries of the state of nature so they will never forget that no good is greater than peace, that anarchy is worse even than tyranny, and that death is the greatest evil; hence they will always obey the state.²⁹ As observed above, the price of being secure is feeling insecure. But insofar as humans long for security in its complete sense, both objective and subjective, how can they be satisfied with a state that requires them to feel continuously inse-

We may pursue this question one step farther.

Hobbes suggests that the deepest desire of human beings—that is, of beings burdened by the awareness of their mortality and hence "gnawed on by the fear of death"—is to be free of the fear of death, and hence to enjoy a "perpetuall... security." That would seem to lead to the conclusion that human beings can never be "contented" under any political order or, indeed, in any circumstance in this life but only, if at all, in an afterlife (Leviathan, xii, 169; xix, 248; xvii, 223). "There is no such thing as perpetuall Tranquillity of mind, while we live here; because Life itself is but Motion, and can never be without Desire, nor without Feare, nor without Sense" (vii, 129-30, emphasis added; see Hobbes 1889b, Human Nature. 7.5-6). He goes so far as to state in De Homine that "the greatest good, or as it is called, felicity and the final end, cannot be attained in the present life" (11.15; see Leviathan, xi, 160).

Indeed, Hobbes might appear to echo St. Augustine's argument that, precisely because human beings long for a complete and perpetual security, we cannot be happy in this life, we can only be happy if there is an afterlife, and so we must long with all our hearts for such an eternal life.

What human being is now able to live as he wishes when life itself is not in his power? Though he wants to live, he is compelled to die . . . Look at a man living as he wishes because he tortured and commanded himself not to wish what he cannot have and to wish only what he can. As Terence says, "Because you cannot do what you want, want what you can do." Is a person like this happy because he is patiently miserable? . . . Moreover, if the happy life is loved as much as it deserves to be . . . then he who loves it in this way cannot but wish it to be eternal. Therefore, life will be happy only when it is eternal (Augustine 1994, 108 [City of God XIV, 25]).

Yet, Hobbes does not call on human beings to devote themselves to the hope of attaining a perpetual security in an afterlife. Instead, he denies that hope and calls on human beings to devote themselves to a state that will provide them with as much security as is possible in this life. Hobbes urges humans to moderate their natural desire for a complete and perpetual security, to be sober in their pursuit of such security, and hence to be satisfied with the incomplete, temporary security that Leviathan, which is after all only a mortal god, can provide (see Leviathan xviii, 238-9). But, even by Hobbes's own account, are humans sufficiently reasonable to be content with a security that is mixed with and even based on the insecurity they seek to flee? Will not their natural desire for complete and perpetual security lead them to long and hope for such security and hence look beyond and even rebel against the secular Hobbesian state?

Perhaps it is because the positive desire for complete and perpetual security threatens to point beyond the state that Hobbes emphasizes more the negative counterpart to that desire: the fear of death. The positive desire for perfect security, like any other positive desire, tempts us to yearn for an unseen, mysterious, and actually nonexistent *Finis ultimus* and *Summum Bonum*, for a good the state cannot provide (*Leviathan*, xi, 160-1). The fear of death focuses our mind not only

²⁸ De Cive, Epistle Dedicatory, 91; Leviathan, xxx, 378. See also, for example, Leviathan, xix, 247−8; xx, 260−1; xxxi, 407−8; Review and Conclusion, 727−8 Consider as well Strauss 1952, 104−7.

²⁹ See Hobbes 1975, 20; *Lewathan*, xv, 215-6, xviii, 236-9; xx, 260-1; xxvi, 320; xivi, 699; *De Cive* 1.7.

on the Summum malum, "the greatest of all evils," "the terrible enemy of nature," but also on that evil from which the state can protect us (De Homine 11.6; De Corpore Politico I.1.6; see De Cive 1.7). The "Feare of Death," not the desire for self-preservation, is the primary passion that "encline[s] men to Peace," and therefore inclines men to establish and obey the state. Indeed, the "Obligation of Subjects to the Soveraign, is understood to last as long, and no longer, than the power lasteth, by which he is able to protect them," it would seem, from death (Leviathan, xxi, 272; see xxix, 375-6).

But does the fear of death simply incline human beings to obey and support the state? It cannot for the following reason: Even the mightiest of Leviathans cannot protect human beings from death. "The terrible enemy of nature" is an ineradicable, essential part of human nature. The very best the state can do is protect us from one form of death, violent death, in order to give us the security "of living out the time, which Nature ordinarily alloweth men to live" (Leviathan, xiv, 190; see xiii, 186; De Cive Preface, 103-4). Insofar as the fear of death leads us to become aware of our inevitable mortality, it would seem to lead to the conclusion that it is unreasonable that human beings should devote their life primarily to avoiding death. It cannot be reasonable to devote one's life to avoiding the unavoidable.31

The recognition that death is an unconquerable part of nature would seem to lead human beings to hope and strive to live on, in some fashion, after they die, perhaps through posthumous fame, or the salvation of the soul, or the contemplation of eternal truths (see De Homine 12.8, 14.12; De Cive 16.1; Leviathan, xi). It would seem to lead them to regard a life devoted to avoiding death, described by Hobbes as "a perpetuall and restlesse desire of Power after power, that ceaseth onely in Death," as a foolish attempt to escape the inescapable (Leviathan, xi, 161; see viii, 139; x, 150). It would seem to lead human beings to the conclusion that the Hobbesian state cannot reasonably command or deserve their complete obedience or loyalty since it cannot live up to its promise to provide them with a "perpetuall" security or protect them from death, but can at best protect them only from violent death (xix, 248; xx, 252; xxi, 272). Indeed, the recognition that death cannot be avoided would seem not only to call into question the reasonableness of the human being who aims above all to avoid death but also to vindicate, in some small measure, the reasonableness of the

³⁰ Leviathan, xiii, 188. See also xiv, 200; xx, 251-2; xxvii, 343 Compare Strauss 1952, 15-8. human being who hopes and strives to live on after death through, for example, a posthumous fame or an afterlife. For such human beings, however unreasonable the hopes they may entertain concerning death, at least face the fact that they must die.

Precisely because the full awareness of the inevitability of death would weaken human beings' attachment to the state and hence to peace itself Hobbes seeks to obscure or even to suppress this truth. For Hobbes, the primary end of philosophy itself is not knowledge or truth but "power," above all the power to avoid the "calamity of a warre with every other man, (which is the greatest evill that can happen in this life)."32 Hobbes rivets his readers' attention on "violent death," on that form of death from which the state can protect us and can inflict upon us, and thereby he seeks to inspire in us the fear of that form of death we can avoid if only we obey the state (Leviathan, xiii, 186). The fear of death as such points beyond the state to the awareness of our mortality and ultimately to heroic or religious hopes or philosophic resignation, but the fear of violent death points to our immediate need for protection and hence to the state.

At the same time, Hobbes blurs the distinction between violent death, which is avoidable, and death as such, which is not. For example, in De Corpore Politico (I.1.6), he calls death "the terrible enemy of nature," as though it were not essential to our nature. In De Cive (1.7), he states that "every man . . . shuns what is evil, but chiefly the chiefest of natural evils, which is death," as though it were possible ultimately to shun death. In chapter 13 of Leviathan he first identifies the "continuall feare, and danger of violent death" as the passion that all feel in the state of nature and then goes on to identify "Feare of Death" as the primary passion that inclines humans to peace (186, 188, emphasis added). Hobbes encourages us not to think about-or, as he might say, to dwell uselessly upon—the fact of our mortality; we must rather act as though death were avoidable and even believe, or at least feel, that death as such is avoidable (Leviathan, xxxi, 407-8). He encourages us to focus on avoiding death in the here and now rather than on seeking to live on after death. That focus will strengthen our attachment to the state and save us from the miseries of anarchy (xiv, 190; see also, e.g., xiii, 188).33

Paradoxically, insofar as reason entails foresight, insofar as it resembles "those prospective glasses, (namely Morall and Civill Science,)" that enable human beings "to see a farre off the miseries that hang over them," reason itself ultimately threatens to undermine the state and the peace (*Leviathan*, xviii, 239; see *De Homine* 12.1). Our rational capacity to "see farre off" must lead us to realize that ultimately we will die, that because the state cannot ultimately protect us from death, we must look beyond the state whose goal

³¹ But consider Hobbes's apparent defense of the reasonableness of devoting oneself to avoiding death in *De Corpore Politico* L1.6: "And forasmuch as necessity of nature maketh men to will and desire bonum sibs, that which is good for themselves, and to avoid [emphasis added] what is hurtful; but most of all, the terrible enemy of nature, death, from whom we expect both the less of all power, and also the greatest of bodily pains in the losing; it is not against reason, that a man doth all he can to preserve his own body and limbs both from death and pain." See Johnston 1986, 35–6; Kraynak 1990, 197–8. Kateb (1989, 373) goes so far as to claim that Hobbes "says next to nothing as to why staying alive is the highest good."

³² De Corpore 1.6-7; Leviathan, XXI, 376; xlvi, 682. See Leviathan, XV, 211 (cf. xiii, 183-4), 215-6; xviii, 232-3; XXVi, 322-3; XXXi, 407-8; De Crve, Preface, 102-4; 21-2; 3.19; 3.31; Johnston 1986, 56; Ryan 1996, 211

³³ For somewhat different accounts of this point, consider Kraynak 1990, 109-10; Manent 1977, 78-84

is peace at all costs. As Hobbes himself points out, the security and contentment of human beings under the Hobbesian state are based on a certain dimming of our foresight, a certain curbing of our reason, and hence on a certain unreason. "That man which looks too far before him, in the care of future time, hath his heart all the day long, gnawed on by feare of death, poverty, or calamity; and has no repose, nor pause of his anxiety, but in sleep" (Leviathan, xii, 169). But the man who does not look "too far before him," who does not think about the death that surely awaits him and hence about his mortal nature, is in a sense already asleep. By suggesting that human beings should suppress awareness of their mortality, Hobbes suggests that a certain sleep of reason, or science, or philosophy is necessary for human "repose."

To clarify this point, it is helpful to contrast Hobbes with Socrates, who also uses the image of wakefulness and sleep. Plato's Socrates suggests in the Apology (29a1-b7, 34b6-35a7) and the Phaedo (64a4-6) that the fundamental difference between philosophers and other humans is their posture toward death. Genuine philosophers practice nothing but dying and being dead; they do nothing but contemplate their mortal nature and urge others to do the same. Socrates compares them to wakeful and awakening gadflies. Nonphilosophers tend to be oblivious to their inevitable mortality. Socrates compares them to a sleeping horse who is angered when the gadfly awakens him. For Socrates, the wakeful, philosophic life is the best way of life for a human being, and the sleepy, unphilosophic, unexamined life is not worth living.34 Not only is it possible for human beings to face and be reconciled to the truth, even and especially the harsh truth about their mortality, but also such human beings lead the best and happiest life. Hobbes, however, suggests that the wakeful, rational awareness of the truth of our mortality leads to anxiety without "pause" and eventually to religious longings and hopes that will, in turn, unleash the miseries of war.35

Apparently because philosophy reminds us of the truth of our mortality and thereby weakens our attachment to the state, Hobbes generally attacks philosophy, attacks the "Leasure" that is "the mother of *Philosophy*," and praises the unphilosophic life, namely, the life of work. He argues that the question central to political philosophy, the question of what is the best regime, should not even be raised. "The present [regime] ought *alwaies* to be preferred, maintained, and accounted best; because it is against both the Law of Nature, and the Divine positive Law, to doe *anything* tending to the subversion thereof" (*Leviathan*, xlii, 577,

Plato 1977a, Phaedo 64a4-6; Apology of Socrates 30e1-31a7, 38a1-b1. See Plato 1976, Laws 808b3-c2, 1978, Republic 514a1-16e2.
 See Leviathan, xii, 168-9; xxxvi, 469; xxxviii, 478-9; De Cive 6.11, 12.5, 18.14; De Homine 13.6.

emphases added). He agues as well that "disobedience may lawfully be punished in them, that against the Laws teach even true Philosophy" (Leviathan, xlvi, 703, emphasis added). To be sure, in the Author's Epistle to the Reader of De Corpore (Hobbes 1889a),³⁷ Hobbes praises philosophy as a divine activity: "Imitate the creation: if you will be a philosopher in good earnest, let your reason move upon the deep of your own cogitations and experience: those things that lie in confusion must be set asunder, distinguished and every one stamped with its own name and set in order; that is to say, your method must resemble that of creation" [see also De Corpore 1.7].

Yet, even here, by comparing the philosopher to the creative, biblical God, Hobbes suggests that the proper goal of philosophy is not to understand and face the world as it truly is—by reflecting, for example, on the truth of our mortality—but, rather, to impose order on the chaotic natural world by acquiring and projecting power, much as Leviathan, "that Mortall God," imposes order on chaotic human nature (Leviathan, xvii, 227). Hobbes goes on to point out: "The end or scope of philosophy is that we may make use to our benefit of effects formerly seen . . . for the commodity of human life The end of knowledge is power" (De Corpore 1.6, emphasis in original). Similarly, it seems, partly because reason leads us to foresee our inevitable death and look beyond the state, Hobbes suggests that irrational creatures are more peaceful and contented than we are. In a certain sense, reason, and therefore our very humanity, is a curse, an enemy of our peace and contentment (Leviathan, xvii, 226; xii, 169; De Cive 5.5). The goal of the modern, Hobbesian state, the goal of peace and security, ultimately requires us to suppress not only our religious hopes and longings but also, to some extent, our very reason. The state that is based on our fear of violent death is based on a forgetting, not only of eternity but also of mortality.38

Hobbes's solution to the problem of anarchy requires a mean between unreason and reason, a mean, that is, between a defective and an excessive foresight. Humans who are at peace must look far enough into the future to see that, without the absolute power of the state, they will suffer the miseries of civil war, among "which is worst of all, continuall feare, and danger of violent death." But they must not look so far into their individual future that they recognize death is inevitable and the state cannot save them from it, lest such a recognition inspire religious passions and hopes that undermine the state. This mean will be achieved by giving humans who are at peace an education which reproduces for them the instructive experience of the state of war. Only if human beings feel truly insecure will they truly appreciate the security the state provides (see De Homine 11.14). And only if human beings fear violent death above all will they view the state as their supreme protector. Hobbes's fundamental hope is that

³⁶ Leviathan, xiv., 683 (emphasis in original); De Homme 11.11. For Hobbes's attacks on philosophy, consider Leviathan, iv, 105–6, v, 113–4; xv, 215–6; xxi, 267–8; xxvi, 322–3; xxix, 369–70; xxxi, 407–8; xivi, 683–703; De Cive, Epistle Dedicatory, 91–2; 1.2, 12.3–4; De Homme 14.4.

the direct or indirect experience of the state of war will produce in human beings a salutary fear of violent death that will enable them to escape from the state of war once and for all. But is that hope reasonable?

THUCYDIDES: THE HOPE FOR IMMORTALITY AND THE ENDURING THREAT OF ANARCHY

Thucydides offers an alternative understanding of the problem of anarchy. Although he was Hobbes's favorite classical author, unlike Hobbes, Thucydides believes the problem is essentially insoluble. "Many harsh things befell the cities on account of civil war, such as happen and will always happen so long as the nature of human beings is the same" (3.82.2, emphasis added). This emphatic statement is the clearest reference in the book to the opening claim that "as many as wish to consider clearly both the things that have happened and the things that once again will happen in the same or a similar way, in accordance with that which is human," will judge his work about the Peloponnesian War "useful" and "a possession for all time" (1.22.4). According to Bolotin (1987, 17), "the most obvious lesson of the work as a whole, for statesmen and others alike, is the sobering one that as long as our species remains, we must reckon on a human nature that will again and again, when given the chance, overpower the fragile restraints of law and justice."39 But why does Thucydides, when examining the apparently same phenomenon of civil war as Hobbes, not conclude with Hobbes that it is possible to escape from civil war once and for all by establishing a state aimed above all at peace? Why does he conclude that such an escape is

Like Hobbes, Thucydides emphasizes the ubiquity of the threat of death in his account of civil war: "Every form of death was present" (3.81.5). Yet, in striking contrast to Hobbes, he maintains that the continuous threat of violent death does not inspire in those who experience it a "continualle feare... of violent death" and a consequent rational and self-interested inclination toward peace (Leviathan, xiii, 186, 188). That threat inspires instead such warlike passions as violent and savage anger, fierce partisanship, and an overpowering desire to commit acts of vengeance, and these passions in turn deepen the disintegration of political society and increase the threat of violent death.

It is especially puzzling that the civil wars do not, according to Thucydides, provoke in those who live through them a self-interested desire for peace, since he suggests that the immediate cause of conflict was the self-interested desire for gain and honor, along with the effect of the war between Athens and Sparta on domestic politics within the Greek cities. After describing the horrors of the wars, Thucydides explains that "the cause of all these things was the desire to rule, on account of acquisitiveness and the love of honor, from which arose the zeal of those who have been plunged into the love of victory" (3.82.8; see 82.1–2). It

would appear, however, that no one's self-interest is ultimately served by the death, destruction, and collapse of society entailed by the civil war.

Even though self-interested passions are the immediate cause of the civil wars, and certain violent acts during them, such as the preemptive attacks by "those of meaner judgment" against their more resourceful opponents, may be motivated by the self-interested desire for security as well as by partisan passion (3.83.3; see 82.6-8), once those wars begin the violence seems to take on a life of its own and the "zeal" (3.82.8) which arises generally seems to overwhelm calculations of interest. Euben (1990, 187) claims that "men have gone mad" in the civil wars. Orwin (1988, 835, 845; see 1994, 181) characterizes the conflict as "a frenzied struggle to exceed one's rival at excess itself" and the men in it as "swept away by the torrent of violence...to prefer vengeance upon their fellow citizens to their own safety." I argue, however, that although Thucydides' account suggests that people became savagely moralistic and ultimately self-destructive, his account also indicates that their behavior was not simply "mad" or senselessly selfless; rather, it reflected their half-conscious, self-interested desire to overcome the threat of death that surrounded them precisely by demonstrating their noble superiority to self-interest.

Thucydides explains that the civil wars in Corcyrea and throughout Greece led to a moral revolution. The new moral code that emerged elevated "courage," or rather the "uncalculating" willingness to risk and even sacrifice one's life, over moderation and prudence (3.82.4) and elevated loyalty to one's party over loyalty to family, the laws of the city, the divine law, and concern for oneself (82.4-6). Far from inspiring a general fear of violent death, the civil war inspired an especially powerful admiration for the willingness to suffer death. Human beings came to celebrate the passionate man who dares to defy death and despises calculations of safety and self-interest as a truly courageous and "manly man" and scorned the prudent concern for life and limb as specious cowardice, "unmanly," and timorous (82.4-5). The ubiquity of the threat of death in the civil wars led humans to praise most emphatically the man who seems to be free from and superior to the desire for self-preservation and to condemn most sharply the one who seems to be enslaved to the fear of death.

But people did not simply praise human beings who were suicidal. Those who embodied the new moral virtues had to be willing not only to die but also to do so for the sake of a just cause, namely, their political party. They had to display greater devotion to the party than to their kin, the laws of their city, or their oaths to the gods, or even to themselves. They had to be willing to dare all and sacrifice all for the sake of the party (3.82.6). Thucydides emphasizes that these partisans did not genuinely care about justice or the common good (see esp. 81.4, 82.8, 84). Nevertheless, inasmuch as party is defined, ostensibly, by devotion to a specific kind of regime—be it oligarchic or democratic—and hence to a specific understanding of justice, these fanatically self-righteous partisans, who were willing

See also Connor 1984, 103-5; Euben 1990, 186; Orwin 1988, 833.

not only to kill but also to be killed for the sake of their party, evidently exhibited, in their own view of themselves, a noble and selfless devotion to justice (consider 3.70, 81.5, 82.4-8).

These two elements of the new morality—the willingness to sacrifice one's life and the zealous devotion to what one believes is "justice"—are brought together most vividly in what seems to be the overriding passion of the participants in the civil wars, namely, their passion for committing acts of vengeance. Again, Thucydides stresses how much injustice was committed as a result of this vengefulness (see esp. 3.84). Most of the cruelty and savagery of the civil wars seems to have been caused by the desire for revenge (see 3.81, 82.3, 7-8, 84; 4.47.3-48; Johnson 1993, 42). Nevertheless, it is important to keep in mind that the passion for vengeance is, from the viewpoint of the one who seeks vengeance, a passion for justice, since it necessarily entails seeking to punish what is thought to be a previous injustice. Earlier in the book, Sthenelaidas emphasizes that the Spartans should seek vengeance against Athens because of its unjust attacks on their allies (1.86). Similarly, Cleon calls for vengeance against the rebellious Mytilineans because of the tremendous injustice they committed against Athens (3.38.1, 39, 40.4-8).⁴⁰ Furthermore, Thucydides indicates that, during the civil war, the desire to commit acts of vengeance eclipsed human beings' attachment to physical well-being and even to life itself. "To avenge oneself against someone was valued more than never to have suffered [injustice] oneself" (3.82.7). He appears to suggest that human beings were willing and even eager to sacrifice their very life to avenge what they believed to be injustice and consequently that they exhibited, according to their own self-righteous selfunderstanding, a zealous, uncalculating, selfless, and hence noble devotion to what they believed to be justice.41

Yet, precisely by observing that "to avenge oneself against someone was valued more than never to have suffered [injustice] oneself," Thucydides indicates that people were not genuinely motivated by anger at injustice or a selfless concern for justice (3.82.7).⁴² He

*O See Connor (1984, 82-89, esp. 85) on "Cleon's justice of revenge"; Orwin 1994, 143-8, esp. 147.

indicates unmistakably that the desire for vengeance was not provoked by first suffering an injustice or, indeed, any harm. The desire to avenge oneself was not motivated by righteous indignation at all. Orwin (1994, 179) contends that during the civil wars, "in a strange but familiar paradox, men become heedless of their lives in their very rage at those who threaten these." But according to Thucydides, people did not truly rage at those upon whom they sought to inflict vengeance. They preferred to suffer injustice and then take revenge than not suffer injustice at all. They believed it was better to be wronged and to avenge that wrong than never to be wronged at all. They welcomed and presumably sought being victims of injustice as a pretext to inflict vengeance. Their apparently zealous. noble, and selfless desire to serve justice by punishing injustice was a pose or a facade that masked—not only from others but also from themselves—their true, self-interested motive. What was that motive? How was it served by affirming to others and themselves that they were so devoted to justice?

Thucydides suggests that the continuous threat of violent death, rather than sobering and frightening human beings, as Hobbes maintains, actually imbues them with a passionate desire to persuade others and themselves that they are superior to such self-interested concerns as the fear of death. War is a violent teacher not because it teaches a rational fear of violent death but rather because it teaches humans a violent, angry, seemingly selfless but actually self-interested passion for justice (3.82.2). But, especially in view of Hobbes's account, it is difficult to understand why the terrible experience of anarchy, in which "every form of death was present," does not lead human beings to cling to dear life at all costs and eventually establish a state aimed at securing peace at all costs.

Thucydides' account suggests that people did not cling to dear life during the conflict precisely because of the ubiquity of death. The terrible insecurity of civil war led them to sense in an especially powerful way their own human fragility and mortality. It made them realize that security for human beings is "hopeless," so they despaired of avoiding the unavoidable, at least by their own efforts alone (3.83.1-3). The war forced them to face "necessity," above all the necessity of death (3.82.2), but they did not calmly resign themselves to it. On the contrary, it aroused in them a violent anger, not toward any specific injustice, but with their overall predicament (3.82.2; see 3.84). Human beings responded to the "necessity" of death with anger, but their anger shows that they did not truly recognize or accept that necessity. Their awareness of the overpowering threat of death provoked in them an overpowering desire to overcome that threat. Their awareness of their mortality awakened or intensified in them a longing to escape the ills attendant upon their mortal nature and hence a longing for immortality. Moreover, their anger suggests that they actually cherished a hope of somehow overcoming their mortal nature. Anger at

not pay sufficient attention to the calculating, self-interested, and hopeful character of this passion for vengeance.

⁴¹ I cannot altogether agree with Connor's (1984, 99) description of the civil war as "moral anarchy" in which "the only principle is the calculation of self-interest" (see also Forde 1989, 142; Slomp 1990, 577-8). It seems to me that Connor underestimates the fanatical "zeal" with which the participants in the civil war engaged in what he calls "Revolutionary Newspeak" (101; cf Orwin 1988, 834-5), as well as the moralistic character of their partisan zeal and passion for vengeance noted by Thucydides (3.82); hence, Connor does not clarify sufficiently the nature of their self-interested hopes and longings. Also, although I agree with Cogan's (1981, 64, 149-55) emphasis on what he calls the "ideological" beliefs of the participants, it seems to me he underestimates the self-regarding hopes underlying their moralism.

⁴² Cogan (1981, 149-54), Connor (1984, 95-105, 244-5), Pouncey (1980, esp., 33, 35, 147), and Slomp (1990, 577-8) do not pay sufficient attention either to this remarkable and crucial statement or to the crucial importance of vengeance in the civil wars. Even the valuable discussions of this statement by Euben (1990, 187-8), Johnson (1993, 42-3), and Orwin (1988, 837, 845, 1994, 179, 183) do

an evil seems to presuppose the hope that the evil can be overcome.⁴³ Indeed, even though Thucydides states that people believed security was "hopeless," he immediately adds that people took precautions so as "not to suffer," which indicates they somehow hoped to secure themselves against suffering (3.83.1–3).

What was the focus of the hope to escape or overcome death? What is the relation between that hope and the desire to affirm to others and themselves that they are superior to such narrowly self-interested desires as self-preservation and are selflessly devoted to justice? According to Thucydides, these human beings in the midst of civil war instinctively pinned their hopes on the only beings who could possibly protect them from "every form of death," namely, the deathless or immortal gods, and they sought to strengthen those hopes by reassuring themselves that they are noble, just, and hence deserve divine favor.

Thucydides points most clearly to the hope for divine favor during the Corcyrean civil war when he observes: "To avenge oneself against someone was valued more than never to have suffered [injustice] oneself" (3.82.7). What is especially remarkable about this claim is that people preferred to suffer injustice and then take revenge rather than not suffer injustice at all. On the one hand, this preference is bewildering; those who suffer injustice are harmed, even mortally, whereas those who do not suffer are not.44 On the other hand, victims of injustice who then punish the wrong-doers may believe they have more reason to hope for divine assistance than those who do not suffer injustice. The experience of injustice can inspire the hope and even the confidence that the gods will assist you, since the gods are supposed to assist those who are wronged (see 5.104, 7.77.1-4 and Aristotle Rhetoric 2.5.20-22). Furthermore, by punishing a wrong-doer, you perform an apparently just deed, affirm your own justice, and presumably render yourself worthy of divine favor (see, e.g., 1.86.5, 1.118.3; cf. 7.18). By stating that people preferred to suffer injustice and then avenge it rather than not suffer injustice at all, Thucydides indicates that people were motivated not by a genuine anger at injustice but by an overriding desire to win divine assistance; they somehow expected to save themselves from death by clearly and emphatically suffering and punishing injustice.

Thucydides makes it clear that the participants in the civil war violated sacred oaths as well as divine law and so were not pious in any formal sense (3.82.6-8, 84). In their eagerness to display their courage, loyalty to party, and passion for vengeance, they clearly defied the letter of religion. Nevertheless, by indicating that

their moralism was not sincere—was not motivated by righteous indignation—but instead was histrionic and self-interested, Thucydides suggests they cherished in their heart an implicitly religious hope for immortality. Their instinctive reaction to the death surrounding them was to seek to affirm, through their courage, loyalty to party, and passion for vengeance, that they were morally superior to the self-interested concern for life and so were somehow deserving of a fate better than death. Their response to the seemingly invincible threat of mortality was to demonstrate to one and all their noble superiority to cowardice, weakness, and fear, and therewith their worthiness of immortal rewards. They acted on the implicit assumption that there are immortal beings who will somehow recognize their nobility and moral virtue and who will somehow enable them to overcome the threat of death. Although their moralism is not explicitly religious, it is guided by an implicitly religious hope for immortality.

The hope for immortality, as Thucydides presents it, does not simply consist of the hope for eternal happiness for the soul, as it does in the Christianity familiar to Hobbes. The hope for happiness in the hereafter was a part of Greek piety and is evident in Thucydides' work from the widespread concern for the recovery and proper burial of corpses.45 But the hope for immortality, as Thucydides portrays it, takes at least two other forms. One is the hope of living on through a city or nation that is protected by the gods forever, which, for example, the Melians express when they insist that the gods who have protected their city for seven hundred years will continue to do so indefinitely (5.112; see 2.36.1-2). The other is the hope of living on in the memory of others by winning the divine reward of eternal fame, which Pericles and the Athenians cherished (see 2.41-3, 64, 6.31-2). Thucydides suggests that at the core of the hope for immortality is the hope that one can somehow overcome one's mortal nature and live on after death by affirming one's justice, nobility, or piety and thereby winning the favor of the immortal gods. It is this hope which Hobbes believes can be checked by the fear of violent death, and it is this hope which Thucydides believes is stronger than and indeed inflamed by the threat of violent death.

The civil wars are, to Thucydides, a microcosm of the war between Sparta and Athens. The danger of violent death was broadly felt by all the participants over the course of the conflict. Throughout his account of the war, Thucydides suggests that the threat and awareness of death do not dampen but rather inflame the hope for immortality. In a general way, the hope to satisfy one's greatest desires cannot be mastered by the threat of even capital punishment. "Human beings are wont, when they desire a thing, to give in to unreflecting hope but to deny with imperious reasoning what they do not care for" (4.108.4). Similarly, Diodotus responds to

⁴³ See 3.45.4 Consider the efforts of Diodottus to calm the Athenians' anger at the Mytilineans who rebelled by arguing that they were compelled by their nature to do so (3.45; see 3.36, esp. 36.2; 3.39–40). Hobbes (De Homine 12.4) notes, "If, when one is pressed or assaulted by evil, a sudden hope is conceived that the evil may be overcome by opposition and resistance, the passion ariseth that is called anyor."

⁴⁴ As Johnson (1993, 42) puts it, "it is not in one's true interest to be reckless or to risk one's life to kill a rival." But Thucydides suggests one might think otherwise if one thinks it is just to do so and believes in gods who reward the just with immortality.

⁴⁵ Consider, for example, Homer 1957, Odyssey 4.561-69, 11.601-3, 6.172-4; Sophocles 1979, Antigone 74-7, 450-70, 897-902; Plato 1978, Republic 330d1-331b7; 1977a, Apology of Socrates 39e1-41c7; 1977b, Crito 54b2-c8; 1977c, Phaedo 63c4-7, 72d6-e2; Thucydides 1963, 4.42-4, 97-9, 7.75.1-4; Xenophon 1968, Hellenica 1.6.24-7.35; and Fustel de Coulanges 1900, 11-2.

Cleon's argument that the threat of violent death will stifle humans' destabilizing hopes with the thesis that "hope and passionate desire are upon everyone, desire leading, hope following, desire contriving the plan, hope supposing the bounty of fortune, both together do the most harm, and being invisible, they are stronger than the terrible things seen" (3.45.5–6).

The Athenian ambassadors at Melos shed light on that thesis by suggesting that humans' "invisible" hope may be so powerful because humans cherish the hope that the invisible gods will satisfy their greatest longings: "Do not resemble the many, who, when they may still be saved by human means, once they are pressed and the manifest grounds for hope abandon them, betake themselves to the invisible ones, to divination and oracles and such things which, together with hopes, cause ruin" (5.103). The Athenians lament that, when pressed by the threat of destruction, as the Melians are, humans are especially inclined to hope that the gods will help them overcome that threat. And the Melians do end up affirming that the gods, who have protected Melos for seven hundred years, will continue to do so (5.112).

Thucydides suggests more specifically, through the case of Pericles and the Athenians, that the awareness of death inflames the longing and hope to live on after death through the attainment of immortal glory. In his last speech, which immediately follows the deadly plague at Athens, Pericles declares that "all things by nature...decline" (2.64.3). With these philosophic words—and also with his general silence about the gods (see 2.13.5)—he seems to call on the Athenians to eschew whatever hopes for immortality they may cherish and to reconcile themselves to their mortal nature. Yet, in the same breath and indeed throughout his speeches, Pericles argues, as do the Athenian envoys at Sparta and Melos, that the Athenians are so noble, so generous and superior to calculations of profit or safety, that their city deserves an "eternal" fame (2.64.3–6; see 2.36, 39, 40.1, 4–5, 41–3; 1.76.3–77, 5.91, 105.3, 107, 111.1-2). Pericles seems to respond to the philosophic thought that all things by nature perish by affirming his hope that nature can somehow be overcome and the Athenians can somehow win the immortal glory they deserve.

This hope seems to be, albeit implicitly and half-consciously, a pious hope. By claiming that the Athenians deserve the reward of eternal glory, Pericles expresses the belief or hope that they will get what they deserve and hence that the world is such that human beings get what they deserve. He must therefore believe or hope that there are gods who ensure rewards in accordance with desert. Furthermore, by claiming that the Athenians deserve in particular the reward of "eternal" glory but at the same time claiming that all things "by nature" decline, Pericles must believe—albeit implicitly and semiconsciously—that there are supernatural and eternal beings who have it in their power to confer eternal rewards on mere mortals. 46 His

awareness of human mortality does not lead him to cling to dear life at all costs or to reconcile himself to his mortal nature; rather he embraces the implicitly pious hope for immortal glory. Indeed, so little does Pericles accept human mortality that, with one exception, he doggedly avoids referring directly to death or the dead in his Funeral Oration (2.43.6; see Orwin 1994, 19; Strauss 1964, 229).

The Athenians as a whole seem to respond to the death and destruction the war inflicts on them by looking more and more explicitly to the gods to bestow on them the reward of immortal glory. Throughout the war they betray an increasingly intense desire to purify the sacred island of Delos in order, it seems, to win the favor of the gods (see 1.8.1, 2.54, 3.104, 5.1, and esp. 5.32.1-2). Furthermore, the emergence of the superlatively pious Nicias as a respected and trusted leader in Athens evidently reflects a growing desire by Athenians as a whole to gain divine favor for their city (see 4.42-4, 7.50, 77, 86). Finally, on the eve of their most glorious military expedition to conquer Sicily, the Athenians zealously persecute those accused of religious crimes and attempt to purify their city of all impiety presumably to enlist the gods' help (6.27-32, 47-53, 60-1). Indeed, it is only after the Athenians initiate their campaign to purge their city of impiety that Thucydides says they had the "greatest hope" for success in Sicily (6.31.6; see 6.32.1-2). Their experience of war seems to intensify their longing for immortality and their hope that, by demonstrating their zealous piety, they can win the divine reward of immortal glory.

Thucydides highlights most clearly the relation among the threat of violent death, moral self-assertion. and religious hope through the example of the Melians. In their effort to subject Melos to imperial rule, the Athenian ambassadors attempt to achieve a peaceful surrender by repeated and brutal threats of complete destruction at the hands of the overwhelmingly superior Athenian forces (see 5.87, 89, 91-2, 101, 103). This strategy backfires. Rather than instill in the Melians a rational fear of violent death, the threats inspire in them what they insist is a reasonable hope that the gods will lead them to victory. "For we are pious men standing against men who are unjust" (5.104; see 1.86.5). In the face of violent death the Melians dig in their heels and affirm their own justice, by word and by deed, in the hope that the gods will save their city from destruction, as they have done for seven hundred years (5.112).47 The participants in the civil wars, moved by a similar hope, respond to the threat of violent death by affirming their own nobility and justice by word and by deed (see 5.85–7, 91–3, 101–4, 112, and 3.81.5–82).

According to both Thucydides and Hobbes, humans respond to the continuous threat of violent death by seeking to escape it. But Hobbes contends they will seek to escape through purely human means, by establishing and supporting a state aimed at peace at all

⁴⁶ Consider Strauss (1964, 229): "There is something reminding of religion in Athenian imperialism."

⁴⁷ Consider especially Bolotin 1987, 19, 28; see also Connor 1984, 149–50; Orwin 1994, 110. For accounts that argue for—and overstate—the reasonableness of the Athenians' speeches but not their deeds at Melos, consider Cogan 1981, 89–90; Palmer 1992, 73.

costs, whereas Thucydides contends they will seek to escape by somehow overcoming their mortal condition, by living on after their death—either through their city, or through their glory, or in an afterlife—and by winning the gods' favor through the vehement affirmation of their own nobility, or piety, or justice. Both Hobbes and Thucydides identify the longing for immortality as the deepest human desire. They both recognize that it cannot be satisfied by the state or by any merely human institution (if it can be satisfied at all), that it points beyond the realm of politics, and that it therefore threatens to undermine political life. Hobbes maintains this desire can be tamed either by the sobering experience of civil war or by an education that reproduces that experience. The primary effect of that experience is to convince human beings that violent death is the summum malum, the avoidance of violent death is the greatest good we can reasonably hope to attain, and the state which protects us from such death deserves our absolute obedience and support. Because Hobbes believes the fear of violent death can control the longing for immortality, he believes the state can provide mortal human beings with an "immortal peace." Thucydides, in contrast, suggests not only that the longing for immortality is more powerful than the fear of violent death but also that the continuous threat of violent death, by deepening our sense of our mortality, intensifies our longing and therewith our hope for immortality.48

CONCLUSION

At the dawn of the century there seems to be increasing dissatisfaction with the modern secular state, and it is tempting to conclude that Hobbes's hope that the Leviathan might constitute the definitive solution to the problem of anarchy is less reasonable than Thucydides' belief that this problem can never be solved. This conclusion might seem especially dispiriting because Thucydides seems to hold a harsher and bleaker view of human nature than does Hobbes (see esp. Pouncey 1980, 42-4, 156-7). Whereas Hobbes believes the

experience of civil war inclines humans toward peace, Thucydides believes it renders most of them violent and savage. Hobbes offers the hope that anarchy can be removed once and for all and an immortal peace attained; Thucydides claims that anarchy is ineradicable because it is rooted in unconquerable human nature. Hobbes views the fear of violent death as, actually or potentially, the most powerful human passion and as a check on the destabilizing longing for immortality; Thucydides considers that longing invincible, and hence considers anarchy an enduring feature of political life.

It must be stressed, however, that Thucydides believes the problem of anarchy can be effectively addressed to a considerable extent. He would not advocate a universal version of the thesis so sharply attacked by Russell Hardin (1995, 177-8) that the civil wars in the former Yugoslavia are "merely predictable history replaying itself through the horrid psychology of singularly wretched people" rather than "failures of political structures."49 In the first place, inasmuch as the longing for immortality is the most powerful human passion, Thucydides suggests that the most stable regimes are those, such as Sparta, which cultivate a political or civil religion.⁵⁰ As Orwin points out (1994, 183), "the passage on stasis reveals . . . better than any other in the work, how deeply mindful is Thucydides of the benefits of Spartan sobriety. He notes that stasis convulsed, 'so to speak,' all of Hellas; in fact it engulfed Athens but not Sparta" (cf. 1.18.1 with 2.65.11-2, 6.53-61, 8.47-98). Thucydides might argue that regimes which appeal to pious hopes through a unifying civil religion rather than appeal primarily to the individual desire for security will be less vulnerable to the threat of anarchy. A modern version of such an argument is found in Abraham Lincoln's (1989a, 28-36, esp. 30-3) "Address to the Young Men's Lyceum of Springfield, Illinois" on "The Perpetuation of Our Political Institutions"; he argued (in 1838) for establishment of a "political religion" in order to address the growing threat of anarchy in the United States.51

But even such regimes as Sparta do not constitute a definitive or "everlasting" solution to the problem of anarchy, of the kind for which Hobbes hopes (*Leviathan*, xxx, 378), since the pious hopes and longings to which such regimes appeal necessarily point beyond the regime and therefore always threaten to undermine it. More generally, Thucydides suggests that extraordi-

⁴⁸ One might object that, m the case of the plague, the threat of death leads human beings, according to Thucydides, to immerse themselves in mmediate, bodily pleasures and abandon moral and pious concerns (see esp. 2.52.3-53; consider Orwin 1988, 842-3). Yet, Thucydides refers to those "who made pretentions to virtue" during the plague and suggests that their visits to the dying, which only served to spread the plague and hence caused "the most destruction," were motivated by a desire to display their own virtue, perhaps to the gods as well as to other humans (2.51.4-5). Furthermore, he stresses that the Athenians believed the plague had been foretold by an oracle and had been sent by the gods to punish Athens in particular, which quite clearly implies that the plague may have made them, in some ways, more rather than less pious (2.54; see 53.4; consider Palmer 1992, 31). Finally, the plague inspired a desire for vengeance As Orwin (1988, 843) notes, the Athenians "go so far as to avenge themselves on Perikles for the plague by fining and temporarily deposing him"; more important, they respond vengefully to the Mytilinean revolt, which occurs during the plague (2.59, 65.1-3, 3.3.1, 13.3, 16.1, 36-40, 87; 104). The account by Thucydides of the plague's effects on the Athenians lends support to the thesis that, in his view, the threat of death intensifies the pious longing for mmortality, as well as the desire to win drvine favor through the vehement affirmation of one's own justice.

⁴⁹ Consider as a whole Hardin 1995, 142-82 and 215-31. See also Hassner 1995, 7-20, 335-54.

⁵⁰ For a fuller account, see Ahrensdorf 1997, 251–61. See also Euben 1990, 190; Strauss 1964, 146–7. For the Spartans' piety, see 1.86.5, 103.1–2, 118.3, 126–7, 134, 2.74–2–3, 5.16–7, 7.18. But for Thucydides' criticusms of Sparta, see 2.2, 71–4, 3.52–68, 4.80, 8.40.2, and Connor 1984, 126–40. Johnson (1993, 28–32, 137, 212–3) does not give sufficient weight to these criticisms.

⁵¹ For Lincoln's later attempts to appeal to plous longings, consider especially his "Second Inaugural Address" (1989b, 686–7). A letter of Lincoln's (1989b, 522–7, esp. 522–3) from 1863 (on conflict in Missouri) presents what Finley (1963, 182–3) rightly calls a "remarkable parallel" to Thucydides' account of the civil war in Corcyra. On Lincoln and Thucydides, consider Finley 1963, 144–5; Orwin 1994, 26–7

nary statesmen, such as Pericles and Hermocrates, can effectively promote unity within their political communities (see 2.34-46, 2.65, 4.58-65, 6.62-3; Johnson 1993, 200). Indeed, Thucydides seeks to provide a political and moral education for his readers—a positive and negative education in wise and humane statesmanship—as is revealed, for example, by his explicit judgments of such leaders as Archidamus, Themistocles, Pericles, Cleon, Brasidas, Peisistratus, Hermocrates, Nicias, and Antiphon.⁵² But, as the fate and legacy of these leaders demonstrate, Thucydides does not believe even the greatest statesmen can achieve anything like the "immortal peace" of the Hobbesian project.53 Thucydides, like Hobbes, encourages his readers to act against inhumanity and folly in the political world as exemplified by Diodotus' efforts to save the Mytilineans from being butchered by the Athenians and to save his fellow Athenians from becoming butchers. Unlike Hobbes, Thucydides encourages his readers to do so with a somber, Diodotean appreciation of the ultimately ineradicable character of inhumanity and folly.54

In one sense Thucydides evidently holds a loftier and brighter view of the human condition than does Hobbes. Hobbes maintains that human contentment requires us to suppress our awareness of the truth that we are mortal, lest we be "gnawed on by feare of death" (Leviathan, xii, 169), whereas Thucydides suggests, most clearly through his own example, that the awareness of mortality and other harsh truths about our nature can constitute the core of a noble and happy life. As his book shows, Thucydides contemplated the horrible things to which our mortal nature exposes us, relentlessly but humanely, with true compassion for his fellow mortals. His account of the plague reveals that Thucydides faced death squarely, without flinching but also without bitterness.55 He composed a book that he judged worthy of immortality—a possession for all time—without any hope that it would survive for all time. Thucydides foresaw with perfect clarity but also with perfect equanimity the future destruction of Athens and Sparta, of his entire world, of all that he cared about, apart from the truth.⁵⁶ Through his own example, he unobtrusively but unmistakably bears witness to a possibility, and therewith a hope, to which Hobbes never clearly refers or for which he never even allows:

52 Sec 1.89, 1.138.3, 1.139.4, 2.65, 3.36.6, 4.81, 6.54.5-7, 6.72, 7.86,

the possibility of combining a full, unshrinking awareness of the truth of our mortality with a genuine serenity of spirit and hence the possibility of becoming genuinely reconciled to our mortal, human nature.57

⁵⁷ I disagree with Pouncey's (1980, 150; see xiii, 42-4) conclusion that Thucydides' "intelligence and his strong concentration on the events as they happen have shown him that neither Pericles' ideals for Athens nor Niclas' personal virtue were equal to the demands made by the war itself. The real coldness of Thucydides' unfinished work is that it falls alent without telling us whether he finally found anything to take their place."

Equilibria in Campaign Spending Games: Theory and Data

ROBERT S. ERIKSON Columbia University THOMAS R. PALFREY California Institute of Technology

e present a formal game-theoretic model to explain the simultaneity problem that makes it difficult to obtain unbiased estimates of the effects of both incumbent and challenger spending in U.S. House elections. The model predicts a particular form of correlation between the expected closeness of the race and the level of spending by both candidates, which implies that the simultaneity problem should not be present in close races and should be progressively more severe in the range of safe races that are empirically observed. This is confirmed by comparing simple OLS regression of races that are expected to be close with races that are not, using House incumbent races spanning two decades.

his article presents new estimates of the effects on the vote of spending by incumbents and challengers in U.S. House elections. As first pointed out by Jacobson (1978), estimation by ordinary least squares regression produces strong coefficients for challenger spending but virtually no effect for incumbent spending. Few would argue, however, that the latter does not matter. The obvious reason for the near-zero coefficients for incumbent spending using OLS is a simultaneity bias, because incumbents spend more when they are in electoral trouble. Somewhat less obvious, and less commonly acknowledged, is that the opposite bias can be present for challengers, who spend more when their prospects are good. In short, the OLS estimates are biased because one is not controlling for candidate expectations of the vote, and these expectations drive spending decisions. We address this problem directly by formulating and solving a game-theoretic model of campaign spending and identifying precisely the finer structure of these simultaneity problems. This characterization of the equilibrium of the spending game has direct implications for obtaining unbiased estimates of incumbent and challenger spending effects, without resorting to multiequation systems.

Several statistical solutions have been proposed to estimate the effects of incumbent spending by overcoming the simultaneity bias. The most common solution is two-stage least squares, whereby instrumental variables are used as proxies for observed incumbent spending. Green and Krasno (1988) used lagged incumbent spending as an instrument, whereas Gerber (1998) used such instruments as challenger wealth and state population in an analysis of Senate elections. Both found significant effects for incumbent spending. In an alternative approach, Erikson and Palfrey (1993, 1998) achieved statistical identification by means of restrictions on the variance-covariance matrix. By assuming that the covariances between each spending

variable and the vote were caused by only vote-onspending and spending-on-vote effects, they also found significant effects for incumbent spending, somewhat larger in magnitude than those of Green and Krasno (1988) but still significantly smaller than challenger spending effects. In a third approach, Abramowitz (1991) used OLS but attempted to neutralize the simultaneity bias by using Congressional Quarterly forecasts of election outcomes as a control for expectations. Even with this control, negligible coefficients for incumbent spending were found, and Abramowitz concluded that incumbent spending has little effect on the vote. In sum, due to seemingly unavoidable methodological difficulties, a consensus has not yet emerged regarding both the relative and absolute magnitudes of incumbent and challenger spending effects on congressional election outcomes.

Our new approach to estimating spending effects uses insights from game theory. We apply OLS to a subset of congressional districts for which a gametheoretic model predicts that the simultaneity bias should be minimal or nonexistent. In these districts, new sources of challenger vote support do not necessarily drive up challenger and incumbent spending. Which districts are they? They are districts in which, before taking spending into account, the vote is expected to be close or even slightly in favor of the challenger. When a close race is expected, both spending effects can be reliably estimated by simple OLS.

We proceed as follows. First, we present the theoretical argument for a near-zero simultaneity bias in districts in which the vote is expected to be close. Second, we translate this theoretical argument into a set of statistical hypotheses and derive closed-form expressions for the asymptotic bias of OLS estimates of spending effects. Third, we provide evidence in support of the predicted curvilinear effects of the expected vote on spending. When the expected vote approximates a 50-50 split, the slopes for spending on (expected) vote are near zero, so that the simultaneity bias should be near zero. Fourth, we present the key empirical result. When the vote is expected to be close (and, thus, the simultaneity bias is minimal), the OLS estimates of spending effects are of roughly equal magnitude for incumbents and challengers. We conclude with a discussion of our findings.

Robert S. Erikson is Professor of Political Science, Columbia University, 2960 Broadway, New York, NY 10027-6902. Thomas R. Palfrey is Professor of Economics and Political Science, California Institute of Technology, Pasadena, CA 91125.

THEORY: THE SPENDING GAME

Our empirical results can be understood in the context of an extended version of the simple spending game framework of Erikson and Palfrey (1993). The model is meant to capture the strategic aspect of spending by two competing candidates, I (the incumbent) and C (the challenger).1 The spending decisions of the two candidates are intertwined because these decisions jointly affect the probability the incumbent will win. Thus, the amount one candidate chooses to spend will depend both on the amount the other candidate is spending and on the expected closeness of the race. This is the spending game.² An equilibrium of the game consists of a spending decision for each candidate with the property that neither candidate can do better by spending more or less than this amount, given the opponent's spending decision and the current electoral conditions. What we show below is the intuitive idea that the equilibrium spending levels of both candidates will increase monotonically with the expected closeness of the race.

The importance of our theoretical analysis is as follows. The formal model implies, among other things, that candidates will indeed maximize their spending when the expected vote is in the neighborhood of 50-50. As a result, for "toss-up" races, the vote-onspending effects will be approximately zero. For competitive races in the range of a close expected vote but in which incumbents are slightly favored, the vote-onspending slopes should be negative but small in magnitude. For races expected to be lopsided in favor of the incumbent, the slopes will be negative and large in magnitude, which can create possibly severe simultaneity problems. Because most races fall in the latter category, regressions that pool all races are fundamentally flawed, even if instrumental variables are used, since that method does not adjust for the fact that the simultaneity problem varies with expected closeness in a predictable and nonlinear way.

The formal structure of the game has the following basic features. Each candidate cares about the probability of winning more than 50% of the vote in the election. The probability I wins is determined by district characteristics, short-term forces, candidate characteristics, campaign spending, and chance. For the moment, treat the first three categories of variables as exogenously fixed. We then can summarize the effects of campaign spending and chance by a simple twice continuously differentiable function, P, which denotes the incumbent's probability of winning as a function of spending by each of the candidates. The probability the incumbent wins also depends on what we call the (prespending) anticipated margin of victory of the incumbent, denoted m. All else equal, the higher is m, the higher is P. The anticipated victory margin incorporates factors that the candidates both treat as exogenous, including national short-term forces and

such district characteristics as partisanship, as well as other factors, such as candidates' health, a recent scandal, and so forth. Each candidate can raise and spend money in the campaign, and the outcome of the election is a function of how much each spends, the prespending anticipated margin of victory of the incumbent, and some random noise.

Raising campaign resources is a costly activity. Promises must be made (Baron 1989a, 1989b), issue positions compromised, fundraisers attended, and so forth. This is formally represented by two twice continuously differentiable, increasing, convex fundraising cost functions, one for each candidate, denoted $K_I(I)$ and $K_C(C)$. The final piece of the equation is the value of winning. We normalize this value at 1 for both the incumbent and the challenger.³ Hence, the payoff functions to the two candidates are given by:

$$U_I(I, C; m) = P(I, C, m) - K_I(I);$$

 $U_C(I, C; m) = 1 - P(I, C, m) - K_C(C).$

We proceed by studying the properties of the Nash equilibria of this game. A Nash equilibrium is defined as a pair of spending levels for each candidate, I^* and C^* , such that each maximizes her payoff (probability of winning minus fundraising costs), given the spending level of the opponent. In particular, we wish to establish existence of a Nash equilibrium of the spending game and then prove that equilibrium spending levels will be higher in closer races.

To guarantee existence of a Nash equilibrium that is fully characterized by the first-order conditions, we assume that each payoff function is strictly concave in the candidate's own spending level. This assumption implies properties of both P and K. Roughly speaking, it says that in addition to K being convex, P cannot be too deterministic. The concavity assumption is:

$$\frac{\partial^2 P}{\partial I^2}(I, C, m) - K_I''(I) < 0;$$

$$-\frac{\partial^2 P}{\partial C^2}(I, C, m) - K_C''(C) < 0.$$

To rule out uninteresting boundary solutions, we also assume $K'_I(0) = K'_C(0) = 0$. Thus, the optimal level of spending for the incumbent, I^* , given some level of spending by C, is always unique, is always strictly positive, and is characterized by the solution to:

$$\frac{\partial P}{\partial I}(I^{\bullet}, C, m) - K'_{I}(I^{\bullet}) = 0.$$

Similarly, for the challenger, we have:

¹ The theoretical analysis also can be applied to open seat races

² Related theoretical work on tournaments as incentive devices and on the effect of commitment on behavior in contests can be found in Drut 1987, Nalebuff and Stiglitz 1983, Rosen 1986.

³ This normalization is without loss of generality, since we allow the incumbent and challenger to have different cost functions. It is also possible to generalize the cost functions. For example, the campaign fundraising cost function could be allowed to depend on m in an additively separable way.

⁴ If the game were not concave, we would have to resort to mixed equilibria.

$$-\frac{\partial P}{\partial C}(I, C^*, m) - K'_{C}(C^*) = 0.$$

Because the game is concave and reaction functions are strictly positive, there exists an equilibrium with strictly positive levels of spending by both candidates. In equilibrium, these conditions are simultaneously satisfied for both, so equilibrium pairs (I^*, C^*) are characterized by the following equations:⁵

$$\frac{\partial P}{\partial I}(I^*, C^*, m) - K_I'(I^*) = 0; \qquad (1)$$

$$-\frac{\partial P}{\partial C}(I^*, C^*, m) - K'_C(C^*) = 0.$$
 (2)

For the empirical section, we are interested in identifying how I^* and C^* change with m and how they both covary with P. We next identify intuitive assumptions on the cross-partial derivatives of P, which imply that I^* and C^* are decreasing in m in elections that favor the incumbent, increasing in m for elections that favor the challenger, and are independent of m for toss-ups. This also implies that spending covaries with P in a similar direction. Moreover, we provide a particular specification of $P(\cdot)$ that satisfies these assumptions and is consistent with the standard linear regression models used in empirical studies.

Since the first-order conditions must hold for every value of m, we can take the total derivative of the left-hand side of equations 1 and 2 with respect to m; set it equal to zero; and use this to identify conditions $dI^*/dm < 0$. As we pointed out earlier, and show formally in Appendix A, this will imply that OLS estimates of the I^* coefficient are biased downward in elections the incumbent is expected to win. This procedure also allows us to obtain sufficient conditions for $dC^*/dm < 0$, which are slightly different owing to the fact that challengers who expect incumbents to spend less will respond by spending more. Taking these total derivatives produces the following two equations:

$$\frac{dI^*}{dm} = \frac{\frac{\partial^2 P}{\partial I \partial C} \frac{dC^*}{dm} + \frac{\partial^2 P}{\partial I \partial m}}{K_I'' - \frac{\partial^2 P}{\partial I^2}};$$

$$\frac{dC^*}{dm} = -\frac{\frac{\partial^2 P}{\partial I \partial C} \frac{dI^*}{dm} + \frac{\partial^2 P}{\partial C \partial m}}{K_C'' + \frac{\partial^2 P}{\partial C^2}}.$$

These are linear in the two unknowns, dC^*/dm and dI^*/dm , and can be solved easily. The solutions are:

$$\frac{dI^*}{dm} = \frac{\frac{\partial^2 P}{\partial I \partial m} \left[K_C'' + \frac{\partial^2 P}{\partial C^2} \right] - \frac{\partial^2 P}{\partial C \partial m} \frac{\partial^2 P}{\partial I \partial C}}{A};$$

$$\frac{dC^*}{dm} = \frac{-\frac{\partial^2 P}{\partial C \partial m} \left[K_I'' - \frac{\partial^2 P}{\partial I^2} \right] - \frac{\partial^2 P}{\partial I \partial m} \frac{\partial^2 P}{\partial I \partial C}}{A};$$

where

$$A = \left[K_C'' + \frac{\partial^2 P}{\partial C^2} \right] \left[K_I'' - \frac{\partial^2 P}{\partial I^2} \right] + \left[\frac{\partial^2 P}{\partial I \partial C} \right]^2 > 0$$

by the second-order conditions. Therefore, $dI^*/dm < 0$ if and only if

$$\frac{\partial^2 P}{\partial I \partial m} \left[K_C^* + \frac{\partial^2 P}{\partial C^2} \right] - \frac{\partial^2 P}{\partial C \partial m} \frac{\partial^2 P}{\partial I \partial C} < 0, \quad (3)$$

and $dC^*/dm < 0$ if and only if

$$-\frac{\partial^2 P}{\partial C \partial m} \left[K_I'' - \frac{\partial^2 P}{\partial I^2} \right] - \frac{\partial^2 P}{\partial I \partial m} \frac{\partial^2 P}{\partial I \partial C} < 0. \tag{4}$$

We assume that inequalities 3 and 4 hold. We next show that these conditions for $dI^*/dm < 0$ and $dC^*/dm < 0$ are satisfied in a wide class of models of P that are commonly used in empirical work.

First, let the index of incumbent vote margin, m, be simply the baseline (prespending) expected incumbent share of the vote minus .5, normalized at candidate spending levels of I = C = 0. Let the incumbent's actual margin of victory, M (which can be negative), equal m, plus a function (not necessarily linear) of incumbent spending, $g_I(I)$, plus some function of challenger spending, $g_C(C)$, plus a random term, ε , with cumulative distribution function $F(\varepsilon)$. Assume $g_I'(I) > 0$, $g_C'(C) < 0$; F is twice differentiable; and its density function, f = F', is symmetric and single peaked around 0.7 This implies $f'(\varepsilon) > 0$ for $\varepsilon < 0$, and $f'(\varepsilon) < 0$ for $\varepsilon > 0$. Thus, we can write

$$M = m + g_{r}(I) + g_{c}(C) + \varepsilon$$
.

The incumbent wins if and only if M > 0 or if and only if $\varepsilon > -m - g_I(I) - g_C(C)$, so

$$P(I, C, m) = 1 - F[-m - g_I(I) - g_C(C)]$$

= $F[m + g_I(I) + g_C(C)].$ (5)

It is easy to verify that inequalities 3 and 4 for $dI^*/dm < 0$ and for $dC^*/dm < 0$ are satisfied when f' < 0 for many P functions. As an illustration, suppose that F is normally distributed with variance σ^2 and that g_I and g_C are linear.⁸ Thus, equation 5 reduces to:

$$P(I, C, m) = \Phi \left[\frac{m + \beta_{VI}I + \beta_{VC}C}{\sigma} \right],$$

⁵ There may be multiple components of the equilibrium correspondence, but the comparative static properties we derive below are satisfied locally with respect to each equilibrium.

⁶ Moreover, equilibrium is unique for this specification, which guarantees unambiguous comparative statics.

⁷ The symmetry assumption can be dropped without loss of generality.

This corresponds to most empirical works on the subject, which employ regression models with linear spending effects.

where Φ is the unit normal cumulative distribution function. Substitution into equilibrium conditions 1 and 2 yields the following two equations as the first-order conditions:

$$\frac{\beta_{II}}{\sigma\sqrt{2\pi}}\,\varphi(\Pi_m^*)=K_I'(I^*);\tag{6}$$

$$\frac{-\beta_{VC}}{\sigma\sqrt{2\pi}}\,\varphi(\Pi_m^*) = K_C'(C^*);\tag{7}$$

where $\varphi(\Pi_m^*)$ is the unit normal density function evaluated at the expected win margin, adjusted for equilibrium spending effects and incumbent vulnerability, $\Pi_m^* = (m + \beta_{VL}I^* + \beta_{VC}C^*)/\sigma$. The expression Π_m^* is the "postspending" expected vote margin for the incumbent, in contrast to m, which is the prespending expected vote margin for the incumbent. Thus, it is important to keep in mind that Π_m^* is endogenous, whereas m is exogenous.

It follows immediately from equations 6 and 7 that elections expected to be close (measured by Π_m^*) will involve higher spending levels by both candidates. This is true because φ is maximized at $\Pi_m^* = 0$, and fundraising costs increase with spending.

We also wish to show that spending is higher in closer elections, measured by m. Because m indexes incumbent vote margin rather than expected closeness, 10 the comparative statics with respect to m will necessarily depend on whether we are at an equilibrium with $\Pi_m^* > 0$ or $\Pi_m^* < 0$. Suppose that $\Pi_m^* > 0$. Because spending effects enter linearly and the normal density function, φ , is monotonically decreasing in the absolute value of its argument, inequalities 3 and 4 derived above are both satisfied. Formally:

$$\begin{split} &\frac{\partial^2 P}{\partial I \partial m} = \frac{\beta_{\mathit{II}}}{\sigma^2 \sqrt{2\pi}} \, \phi'(\Pi_{\mathit{m}}^*) < 0; \\ &\frac{\partial^2 P}{\partial C^2} = \frac{\beta_{\mathit{IC}}^2}{\sigma^2 \sqrt{2\pi}} \, \phi'(\Pi_{\mathit{m}}^*) < 0; \\ &\frac{\partial^2 P}{\partial C \partial m} = \frac{\beta_{\mathit{IC}}}{\sigma^2 \sqrt{2\pi}} \, \phi'(\Pi_{\mathit{m}}^*) > 0; \\ &\frac{\partial^2 P}{\partial I \partial C} = \frac{\beta_{\mathit{II}} \beta_{\mathit{IC}}}{\sigma^2 \sqrt{2\pi}} \, \phi'(\Pi_{\mathit{m}}^*) > 0; \text{ and} \\ &\frac{\partial^2 P}{\partial I^2} = \frac{\beta_{\mathit{II}}^2}{\sigma^2 \sqrt{2\pi}} \, \phi'(\Pi_{\mathit{m}}^*) < 0. \end{split}$$

Therefore,

$$\frac{\partial^{2}P}{\partial I\partial m}K_{C}^{"}<0;$$

$$-\frac{\partial^{2}P}{\partial C\partial m}K_{I}^{"}<0;$$

and

$$\begin{split} \frac{\partial^2 P}{\partial C \partial m} \, \frac{\partial^2 P}{\partial I^2} - \frac{\partial^2 P}{\partial I \partial m} \, \frac{\partial^2 P}{\partial I \partial C} &= \frac{\beta_{\mathcal{VC}} \beta_{\mathcal{VI}}^2}{\sigma^4 \sqrt{2\pi}} \, \phi'(\Pi_{\textit{m}}^{*}) \\ &- \frac{\beta_{\mathcal{VI}} (\beta_{\mathcal{VI}} \beta_{\mathcal{C}})}{\sigma^4 \sqrt{2\pi}} \, \phi'(\Pi_{\textit{m}}^{*}) = 0; \\ \frac{\partial^2 P}{\partial I \partial m} \, \frac{\partial^2 P}{\partial C^2} - \frac{\partial^2 P}{\partial C \partial m} \, \frac{\partial^2 P}{\partial I \partial C} &= \frac{\beta_{\mathcal{VI}} \beta_{\mathcal{VC}}^2}{\sigma^4 \sqrt{2\pi}} \, \phi'(\Pi_{\textit{m}}^{*}) \\ &- \frac{\beta_{\mathcal{VC}} (\beta_{\mathcal{VI}} \beta_{\mathcal{C}})}{\sigma^4 \sqrt{2\pi}} \, \phi'(\Pi_{\textit{m}}^{*}) = 0, \end{split}$$

which, from inequalities 3 and 4, implies that both parties spend more in elections that are expected to be close. That is, $dI^*/dm < 0$ and $dC^*/dm < 0$. Also notice that this specification of P has the nice property that if spending effects and marginal fundraising costs are symmetric for incumbents and challengers, then Π_m^* is exactly equal to m. Even if these effects are not exactly symmetric for the two candidates, continuity implies that Π_m^* will closely track m, so the prespending index of incumbent strength, m, is also an equilibrium postspending index of incumbent expected vote margin. In the closest possible race, in which $\Pi_m^* = 0$, φ attains its maximum, so equilibrium spending is maximized for both candidates. For incumbents less vulnerable than this (nearly all cases in practice), equilibrium spending by each candidate is decreasing in the (normalized) equilibrium expected incumbent share, Π_m^* .

Before proceeding, it is useful to point out that signs on the three cross-partial derivatives— $\partial^2 P/\partial C\partial m > 0$, $\partial^2 P/\partial I\partial m < 0$, and $\partial^2 P/\partial I\partial C > 0$ —have a natural interpretation. Consider the first two of these. Because the density function is single peaked at 0, the effect of spending on the probability of winning is higher the closer the election is expected to be. That is, it is highest at $\Pi_m^* = 0$. Then, for values of m such that the equilibrium probability the incumbent wins is exactly 5, the sign of both cross-partials is 0, since $\varphi'(0) = 0$. (In this case, equilibrium spending levels are locally constant in m.) For values of m higher than this, the equilibrium probability the incumbent wins is greater than 5; therefore, as m increases, all else held constant, the election will be less close, so the marginal effect of spending (proportional to $\varphi(\Pi_m^*)$) is lower, which is precisely what is meant by $\partial^2 P/\partial C \partial m > 0$ and $\partial^2 P/\partial I \partial m < 0$. The third cross-partial derivative has a similar interpretation. When $\Pi_m^* > 0$, greater spending by the challenger leads to a closer election, which makes the marginal effect of incumbent spending higher, hence $\partial^2 P/\partial I \partial C > 0.11$

A mirror image of this effect arises if $\Pi_m^* < 0$. For this rare category of races, in which incumbents are

⁹ Keep in mind that the equilibrium spending effects themselves are a function of m.

¹⁰ That is, expected closeness decreases in the absolute value of m.

 $^{^{11}}$ For values of m such that the equilibrium probability the incumbent wins is less than .5, the signs of these cross-partials are all reversed. In that case, data would exhibit the opposite feature, in which equilibrium incumbent and challenger spending would be positively correlated with the vote.

more likely to lose than to win, equilibrium spending by each candidate actually increases in the normalized equilibrium expected incumbent margin of victory, Π_m^* . Finally, if cost and spending effects are roughly the same for the incumbent and the challenger, then $\Pi_m^* \sim 0$ if and only if $m \sim 0$.

To consider specific candidate cost functions, suppose K is quadratic, so $K_I(I) = (1/2\alpha_I)I^2$ and $K_C(C) = (1/2\alpha_C)C^2$, where α_I and α_C can be interpreted as fundraising efficiency parameters for the incumbent and challenger, respectively. Substituting this into the equilibrium equations above yields

$$\frac{\alpha_I \beta_{VI}}{\sigma \sqrt{2\pi}} \varphi(\Pi_m^*) = I^*; \tag{8}$$

$$\frac{-\alpha_C \beta_{VC}}{\sigma \sqrt{2\pi}} \varphi(\Pi_m^*) = C^*. \tag{9}$$

This implies that equilibrium candidate spending should be proportional to the normal density of the expected incumbent margin of victory. It is also interesting to note another property of the equilibrium. Our assumptions guarantee that C^* and I^* are both strictly positive, so we can divide equation 8 by equation 9 to obtain

$$\frac{I^*(m)}{C^*(m)} = -\frac{\alpha_I \beta_{VI}}{\alpha_C \beta_{VC}},$$

which illustrates explicitly why there is a positive correlation between I^* and C^* in the normal-quadratic model that is so widely used for estimation.

The key is that, for districts in the range of a 50-50 expected vote, the vote-on-spending slopes are near zero; cases with mildly negative slopes balance a similar number of mildly positive slopes. Therefore, by limiting our sample to races expected to be close, there should be little concern about a simultaneity bias to distort the estimation of spending effects in the OLS estimation of the vote equation.

METHODOLOGY: SIMULTANEITY BIAS AND VARYING PARAMETERS

The following three-equation system is used to explain the methodological implications of our theoretical model. The first equation has incumbent share of the two-party vote as a dependent variable, and the other two have challenger and incumbent spending, respectively, as the dependent variable. This system was studied extensively in Erikson and Palfrey (1998), and the reader is referred there for more details.

$$V = \beta_{VC}C + \beta_{VI}I + \gamma Z + \varepsilon_{V}; \qquad (10)$$

$$C = \beta_{CV} V_C + \varepsilon_C = \beta_{CV} V + w_C; \qquad (11)$$

$$I = \beta_{IV} V_I + \varepsilon_I = \beta_{IV} V + w_I; \qquad (12)$$

where

V = incumbent percentage of the (two-party)vote;

C = the log of challenger spending (in 1978 dollars) plus 5,000;

I =the log of incumbent spending (in 1978 dollars) plus 5,000;

Z = a set of instruments to predict the incumbent vote without directly affecting spending;

 V_C , V_I the challenger and incumbent expectations of

the incumbent vote margin; $V_C = V + u_C$ and $V_I = V + u_I$ (candidates observe an imperfect signal of V); and

 $w_C = \beta_{CV} u_C + \varepsilon_C$ and $w_I = \beta_{IV} u_I + \varepsilon_I$.

We assume w_C and w_I are uncorrelated with ε_V , but we allow that w_C and w_I may be correlated with each other.

Two interesting methodological problems occur in the estimation of this three-equation system. The first and most commonly noted is simultaneity. In a nutshell, both candidates spend more when races are close. The second involves "varying parameters." That is, the coefficients on the independent variables in the two spending equations (11 and 12) vary across the sample in a systematic way. Specifically, our theoretical model establishes that the equilibrium values of β_{CV} and β_{IV} covary with expected vote.

We next derive the asymptotic bias of the coefficients in the vote equation and prove that this bias vanishes in close races. Before presenting the formal argument, we explain the intuition behind this. The results from the theory section established that both β_{CV} and β_{IV} are approximately zero when V is in the neighborhood of 50%. This is very important, because it means that incumbent and challenger spending on "close" races in this range can be treated simply as exogenous, and unbiased estimation of the vote equation can be done by OLS, which we prove formally below. Intuitively, it means that the parameters of equations 11 and 12 vanish. In contrast, for the large majority of districts used in past cross-sectional studies, V is significantly greater than 50, and β_{CV} and β_{IV} are negative in this region, with their magnitude varying with V in a nonlinear way. This implies a negative bias in the OLS estimates of β_{CV} and β_{IV} , so OLS will inflate challenger spending effects and deflate incumbent spending effects.

To derive formally the asymptotic bias of the spending-on-vote coefficients, we fix Z at some level, so that β_{IV} and β_{CV} can be treated as approximately constant. To simplify the exposition, suppose that, conditional on Z, I and C are uncorrelated. 12 Standard analysis then yields (see Appendix A for derivation):

$$\text{plim } \beta_{VI}^{OLS} = \beta_{VI} + \frac{\beta_{IV}\sigma_{ev}^2}{(1 - \beta_{IV}\beta_{VI} - \beta_{CV}\beta_{VC})\sigma_I^2} \neq \beta_{VI},$$
(13)

unless $\beta_{IV} = 0$, and

$$\text{plim } \beta_{VC}^{OLS} = \beta_{VC} + \frac{\beta_{CV}\sigma_{ev}^2}{(1 - \beta_{IV}\beta_{VI} - \beta_{CV}\beta_{VC})\sigma_C^2} \neq \beta_{VC},$$
(14)

¹² The general case is treated in Appendix A.

unless $\beta_{CV} = 0$. The second terms in equations 13 and 14 represent the asymptotic bias of the OLS estimate of the spending-on-vote coefficients, and σ^2 denotes variance.

It follows immediately that if $\beta_{IV} = \beta_{CV} = 0$, then the asymptotic bias disappears for both challenger and incumbent spending effects, and OLS estimates of β_{VI} and β_{VC} are consistent. This is indeed our main theoretical point, since the spending game model implies that $\beta_{IV} = \beta_{CV} = 0$ when the expected vote is 50-50.13 Therefore, β_{VI} and β_{VC} can be estimated without simultaneity bias by using close races. Furthermore, as we show in Appendix A, this is true even if I and C are highly correlated.

Even when races are not expected to be close, it is not difficult to sign the bias terms. It is easy to show that $(1 - \beta_{IV}\beta_{VI} - \beta_{CV}\beta_{VC}) > 0$, so the sign of the two bias terms in equations 13 and 14 are given by the signs of β_{IV} and β_{CV} , respectively. If the incumbent is expected to have a safe margin of victory, then the vote effects on spending (β_{IV} and β_{CV}) are negative (safer incumbents induce less spending), so the estimates of both spending effects on the vote are biased in the negative direction. Hence, the bias deflates the positive effect of incumbent spending on the incumbent vote and inflates the negative effect of challenger spending on the incumbent vote.¹⁴

Interestingly, the two biases are not exactly symmetrical, even if the vote-on-spending effects are equal for incumbents and challengers. The reason is that, empirically, challenger spending has more variance than incumbent spending $(\sigma_I^2 < \sigma_C^2)$, so the negative simultaneity bias deflates the incumbent spending effect to a greater extent than it inflates the challenger spending effect. One final point remains. The parameters β_{IV} and β_{CV} are only approximately constant because, for instance, β_{IV} will locally vary as V responds as a function of both w_V and ε_I , even with Z held fixed. But if the variability in β_{IV} and β_{CV} is symmetrical in the neighborhood of 50% (so that the effect of 50 + ϵ percent of the vote equals the effect of $50 - \epsilon$ percent), then nothing of consequence changes. Should this symmetry not hold, the point at which the asymptotic bias is exactly equal to 0 could be slightly greater than or slightly less than 50-50.

THE DATA

The units of our analysis are 1,792 contested House races, 1974–80 and 1984–90, involving a veteran (i.e., nonfreshman) incumbent who won a contested race from the same district in the previous election. ¹⁵ We generated a reduced-form equation whereby we predict the expected prespending incumbent vote (Z)

from a collection of exogenous variables: lagged incumbent vote; district presidential vote for the incumbent's party (1976 in the 1970s, 1988 in the 1980s); and effects for year, incumbent party, a dummy for southern states, and the relevant interaction terms. ¹⁶ Because this reduced-form equation is lengthy and tangential to our central point, the details of its construction are presented in Appendix B. It accounts for 58% of the variance in the incumbent vote. We exploit this equation to obtain an expected incumbent vote, which is not identical to the expected vote that candidates themselves observe, but we consider it a good measure of the candidates' expected vote that is uncontaminated by spending effects.

This measure of the expected vote (Z) serves as an instrumental variable for a two-stage least-squares analysis of the effects of the (expected) vote on the two spending variables. If the vote-on-spending effects were linear, then we would simply regress spending on the predicted vote. Here, our prediction is decidedly nonlinear, following our theoretical argument. Accordingly, our task is to estimate the nonlinear slope contingent on the value of the expected vote.

The Effect of the Vote on Spending

Do we obtain our prediction of a curvilinear effect of the vote on spending, that is, zero when the vote is 50-50? Figure 1 is a scatter plot of the logarithm of real challenger spending in all veteran-contested House elections between 1972 and 1990 against incumbent share of the vote.

The fit with the simple normal-quadratic model proposed above is surprisingly good. To illustrate, we have superimposed a fitted nonlinear regression line, ¹⁷ using locally weighted least squares, or LOWESS (Cleveland 1979). This has a shape that resembles the bell curve signature of a normal distribution, with a maximum near to 50% of the incumbent vote, as predicted. A similar graph in Figure 2 for incumbent spending as a function of vote shows a similar fit.

As clear as the patterns of figures 1 and 2 appear to be, technically they are not quite right. Just as we should not estimate the effects of spending on the vote without considering the simultaneity bias from the influence of anticipated vote on spending, we should not depict the (anticipated) vote-on-spending effect without considering the reverse effects of spending on the vote. Accordingly, we turn to the two-stage least-squares approach to estimate the nonlinear slopes of spending predicted from the proxy for the vote, that is, our prediction of the vote in the reduced-form equation (Z). We simply show the nonlinear lopes of spending contingent on the expected vote rather than the actual vote. This task approximates the presentation of figures 1 and 2; by using the instrumental

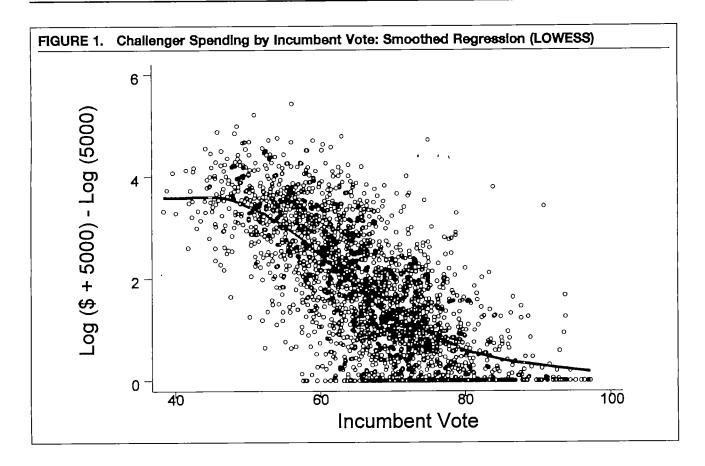

¹³ By continuity, the asymptotic blas is approximately 0 for close races in the neighborhood of 50-50.

¹⁴ Note that if the expected incumbent vote were less than 50%, then the direction of the bias would reverse, and spending effects would be inflated.

¹⁵ The 1982 races were excluded because we use lagged incumbent vote to construct Z, and the 1980 incumbent vote does not match the 1982 incumbent vote due to redistricting.

¹⁶ Year, incumbent party, and region (South/non-South) were combined in all possible interactions, in effect generating separate intercepts for $8 \times 2 \times 2 = 32$ groups, such as "nonsouthern 1974 Republicans."

¹⁷ The fit is done using a bandwidth of .20.

variable of the expected vote, we avoid any distortion due to causal feedback.

Figure 3 displays the estimated vote-on-spending effects, using Z as our proxy for the actual vote. The slopes shown are LOWESS estimates—nonlinear curves built from locally linear approximations over different bands of the expected vote. Figure 3 replicates the patterns shown in figures 1 and 2. We observe the nonlinearity in the slopes, corresponding to the kind of nonlinearity predicted by the theoretical model presented previously. For lopsided races in the 55–75% range, the spending-on-vote slopes are steeply negative. As the expected incumbent vote approaches 50%, the spending-on-vote slopes flatten considerably. We also see evidence of the predicted sign reversal when the incumbent's expected vote drops below 50%, a fate that befell 17 incumbents.

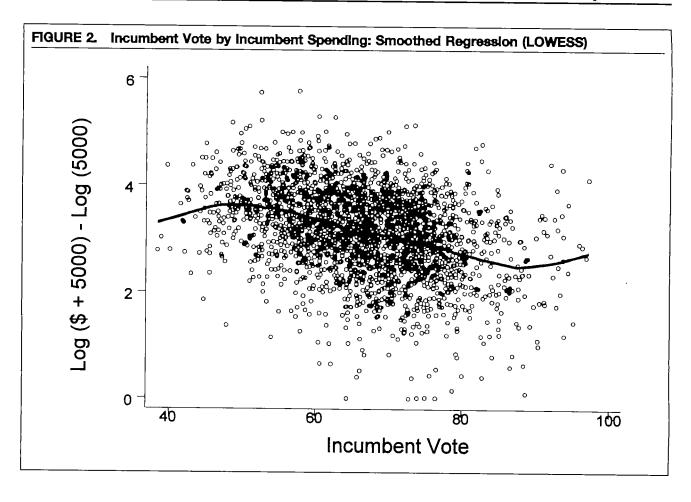

By overlaying the spending functions for incumbents and challengers in the same graph, Figure 3 highlights asymmetries between their spending equations. The slope is steeper for challengers than for incumbents. The largest spending gaps are in safe districts, which is consistent with the theoretical argument that in safer seats there is more incentive for contributors to invest in incumbents rather than challengers (Baron 1989a, 1989b; Snyder 1990). Note that in very competitive districts the gap between incumbent and challenger spending virtually disappears. Incumbents evidently are usually better able to raise money than are challengers but not due only to their incumbency. Rather, an incumbent's advantage over a challenger in raising

cash appears to increase with his likelihood of winning. To the extent that the expectation of victory induces lower costs of fundraising, the effect of spending on the vote becomes all the more crucial. A spending advantage induced by an anticipated victory further increases the advantage of likely winners if indeed candidate spending appreciably affects the vote.

For the purpose of estimating spending effects, it is less important to account for the exact spending functions than to note that the functions shown in figures 1 and 2 are maximized when the vote is 50–50. We now see that our game-theoretic model of optimal spending decisions by candidates is not merely an exercise in formal theory, it matches up with the data surprisingly well. Thus, it provides a rigorous and empirically sound theoretical foundation for what common sense has long suggested should be a basic law of campaign spending: All else equal, both candidates will spend more when the election is expected to be close.

These results clearly indicate the nature of the measurement problem in estimating the effects of challenger and incumbent spending on the vote. Since the (expected) incumbent vote in contested House elections is almost always in the range of 55–75%, simultaneity should bias OLS estimates of incumbent spending effects downward and estimates of challenger spending effects upward (more negative for the incumbent vote). Any simple one-equation model will

¹⁸ Approximately 80% of the cases (1,491 of 1,792) have an expected vote in the 55-75% range.

generally overestimate the negative effect of challenger spending and underestimate the positive effect of incumbent spending on the incumbent share of the vote.

We are now in a position to correct this situation. By isolating districts where the vote is expected to be close, we select districts where the additional shocks to the expected vote should have little effect on spending. For these districts, incumbent spending and challenger spending can be considered exogenous, which we can estimate via OLS.

The Effects of Spending on the Vote

Table 1 presents OLS equations that predict the incumbent vote from the two logged spending variables and the expected vote, with cases grouped according to expected vote. In column 1 is the equation for the 40 very close races with an expected incumbent vote below 52%. For these contests, the means for both the actual and predicted incumbent vote are virtually 50%. In theory, if the effects of incumbent and challenger spending are identical, we should find virtually identical coefficients for the two spending variables, except for their sign. This is what column 1 shows. 19 More-

over, even with only 40 cases, both spending coefficients are statistically significant.²⁰

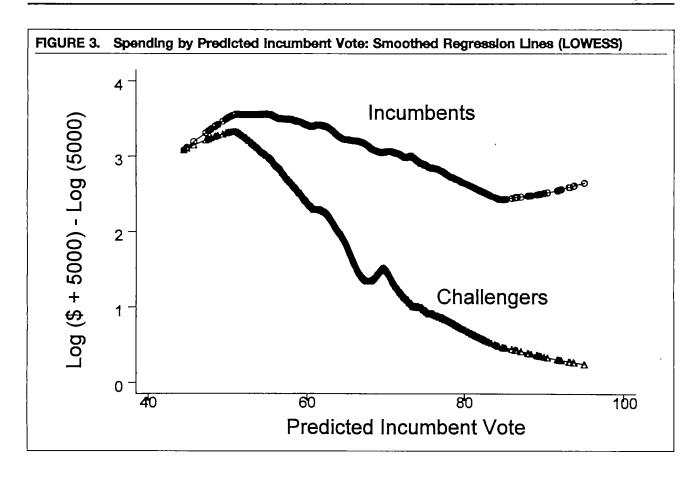

Column 2 expands the analysis to the 77 cases in which the expected incumbent vote was 52–55%. As illustrated in Figure 3, this is the beginning of the range of the expected vote at which the slopes for its effect on spending are negative. Here, the statistical bias should create only a mild diminution of the incumbent spending coefficient. Column 2 shows another statistically significant coefficient for incumbent spending, but less than that for challenger spending, as predicted.²¹

When the incumbent is expected to win by about 55% or more, the vote-on-spending slopes are steeply negative, so the bias is quite severe. As column 3 of Table 1 reveals, for districts in which the incumbent is expected to receive 55–58% of the vote, the OLS estimate of incumbent spending is negligible and decidedly nonsignificant. This pattern is repeated in further categories of three-point increments of the expected incumbent vote. Overall, when that vote exceeds 58%, the simultaneity problem is so severe that

¹⁹ Using conventional significance levels, one cannot reject the null hypothesis that these coefficients are the same.

²⁰ These results hold when candidate quality is controlled by means of a dummy variable, challenger prior office, added to the right-hand side; they also hold (with an increased standard error, as expected), when Z is replaced by its many component variables. See Appendix B for details.

²¹ The difference is significant at the p = .11 level.

the coefficient on incumbent spending actually reverses sign. The estimates are presented in column 4. The pooled results for all cases are given in column 5, which produces the well-known implausible result that challenger spending matters, but incumbent spending does not.

Our OLS estimates convincingly demonstrate that incumbent spending matters in close races. It may be tempting also to accept the OLS estimates for less competitive races, which would suggest that, unlike vulnerable incumbents, safe incumbents cannot spend effectively. It would be a mistake, however, to treat the coefficients in Table 1, columns 4 and 5, as anything short of seriously biased, given the formal results discussed earlier. Of course, there is no plausible reason why marginal incumbents (often marginal because of their own ineptitude) would spend effectively, whereas safe incumbents (coded safe in part due to their track record) would spend ineffectively.

As we move from competitive to safe seats, the OLS coefficients for incumbent spending decline so far as to be virtually zero. Meanwhile, the OLS coefficients for challenger spending show no corresponding increase. If simultaneity bias for noncompetitive races accounts for the deflated estimates for incumbent spending, why do we not see an inflation in coefficients for challenger spending? There are at least three contributing factors that can be identified.

First, for challengers and perhaps for incumbents as well, it is plausible that spending effects (votes gained

per logged dollar) decline when the seat is perceived as safe. When the outcome appears foregone, voters may pay less attention, and candidates may spend a smaller portion of their budget on actual vote-winning activities. Furthermore, the generally inexperienced challengers for safe seats may spend inefficiently. All this suggests offsetting processes that affect OLS estimates of challenger spending effects as one moves from competitive to safe seats. The bias exaggerates challenger spending effects that are getting weaker and deflates incumbent spending effects that may also be getting weaker.

A second reason OLS estimates of challenger spending effects appear insensitive to simultaneity bias may be that there actually is less such bias for challengers. Being less informed than incumbents, inexperienced challengers may estimate the expected vote with greater noise. In particular, they may be less able to gauge the unmeasured causes of the vote, such as their own vote appeal, the contribution of the previous challenger to the incumbent's previous margin, and any shift in the incumbent's attractiveness to voters.²²

A third reason, already noted, is the fundamental asymmetry of the simultaneity bias for challengers and incumbents: The vote-on-spending effects and spending-on-vote effects have opposite signs for incumbents but the same sign for challengers. For favored incum-

²² Some empirical support for this argument is reported in Erikson and Palfrey 1998.

			Spending by Expo expected incumbent

bents, the cycle is negative: New spending increases the incumbent's vote, which dampens the value of spending further. For underdog challengers, the cycle is positive: New spending increases their vote, which amplifies the value of spending further. One statistical consequence is that (everything else being equal), in equilibrium, challenger spending will have greater variance than incumbent spending, a pattern clearly observed in the data. As can be inferred from equations 13 and 14, higher spending variance attenuates the bias in estimated spending effects. See Appendix A for further details.

Putting the three parts of the explanation together, as one moves from competitive to safe districts, the OLS estimate of incumbent spending collapses due to the increased bias plus a possible decline in spending effectiveness when the seat is safe. Meanwhile, the OLS estimate of the challenger spending effect stays roughly constant, as the lesser bias may decline only modesty and is offset by the decline in spending effectiveness.²³

The CQ Expected Vote

One alternative way of measuring perceived electoral closeness deserves our attention. We supplement our measurement of electoral expectations by incorporating Congressional Quarterly's measure of the expected vote. During October of every campaign over the two decades of this analysis, CQ rated each of the 435 House races on a scale from "safe Democratic" to "safe Republican."²⁴

We fold this scale based on incumbent party affiliation to form a scale of expected vulnerability. Three categories emerge (the numbers in parentheses are usable cases): close, coded by CQ as "favoring the challenger" or "too close to call" (N=83); leaning, coded by CQ as "leaning" or "likely" for the incumbent (N=340); and safe, coded by CQ as "safe" for the incumbent (N=1,369).

A district's rating on this scale reflects not only the exogenous variables that make up our measure of the expected vote but also the more intangible sources of the current vote (challenger strength, and so on) that candidates may observe during the campaign but are not part of our equation. To the extent that CQ raters observe the same intangible sources of the vote that candidates observe when they make their spending decisions, the simultaneity problem becomes minimized.

This argument is not new (Abramowitz 1991). Following logic similar to that in the previous paragraph, Abramowitz decided to include the CQ expected vote category in OLS equations predicting the incumbent vote. Even with CQ ratings on the right-hand side of the equation, the coefficient for incumbent spending was insignificant. Abramowitz concluded that the estimates of small incumbent spending effects were not an artifact of simultaneity bias, as commonly supposed.

One limitation of CQ ratings as a control for intangible sources of the vote is that they chop the cases coarsely into only three usable categories, and 78% fall in the safe category. Obviously, different degrees of "safeness" are not distinguished. In contrast, the CQ ratings single out only a select few races as "close." Among the 83 cases so defined, there may be little variation in degree of vulnerability as observed by CQ or the candidates. In any case, CQ-coded close races are very close on average, so the simultaneity problem

²³ As side evidence for declining spending effectiveness in general as seat safety increases, consider the OLS regression of the incumbent vote on the difference between I and C for different levels of Z. Since the IC difference expands as a function of the anticipated vote margin, the positive bias in this estimate should increase with Z, the instrument. Instead, the coefficient for the IC difference declines with Z.

²⁴ The *CQ* predictions are found in *Congressional Quarterly*'s biennial election supplements. Each election year, *Congressional Quarterly* publishes a supplement of more than 100 pages, handicapping the congressional elections. The supplement is almost always published

in issue 41 (the 41st week), and (for the years of our analysis) can always be found for the CQ issue for the date ranging from October 9 to October 15.

TABLE 2. OLS Regression of incumbent Vote on Spending by CQ Categories of Competitiveness

		CQ	Forecast

is minimal. The mean incumbent vote in the CQ-defined close races is 49.5%.

In the analysis that follows, we estimate the vote equation separately for the three categories (close, leaning, and safe districts), using as right-hand-side variables the log of spending for incumbents, the log of spending for challengers, and our measure of the expected vote. We also show the results when we pool the cases, with CQ groupings on the right-hand side as dummy variables. Table 2 displays the results. (See Appendix B for the auxiliary analysis, which gives the results with challenger prior office added to the righthand side and with Z replaced by its many component parts.) With the control for CQ ratings, the spending coefficients are slightly lower than in Table 1, because the ratings are created just a few weeks before the election and inevitably absorb some of the effects of early spending during the campaign.

The fourth column of Table 2 shows the results with all cases pooled, comparable to column 5 of Table 1 but with the addition of two CQ variables. Here, CQ categorization helps predict the vote independent of our expected-vote measure; just as Abramowitz observed, we find a nonsignificant coefficient for incumbent spending. Simply including these variables in the regression does not redress the theoretical problem that equilibrium spending varies systematically with expected closeness. Hence, we consider the first three columns, which show the regressions separately by degree of CQ "safeness."

In column 1 are the OLS results for races CQ defined as close. For this group, our expected vote measure is of little importance for predicting the

outcome. Crucially, incumbent spending is statistically significant and, for the first time among our sets of equations, larger in absolute magnitude than the coefficient for challenger spending.²⁵

This result contrasts with that given in column 3, at the other end of the safety spectrum. For the vast bulk of contests deemed safe for the incumbent, the coefficient for incumbent spending is nonsignificant, as if incumbent spending did not matter. In these races the simultaneity distortion is severe.

In races that lean to the incumbent, column 2, the coefficient for incumbent spending is of lesser magnitude than that for challenger spending.²⁶ Yet, the incumbent spending coefficient is statistically significant, even with the evident simultaneity bias.

Let us focus on the crucial set of races deemed by informed observers at the time as too close to call. These are the pivotal districts that were seen to be most in play during the actual election campaign. The incumbent spending coefficient for this set of cases is, if anything, slightly stronger than that for challengers because of a drastic reduction if not elimination of the simultaneity bias. In races that CQ rates too close to call, the simultaneity bias is minimal in the first place.

Note that the coefficients for both incumbent and challenger spending in CQ's close races are lower than in races predicted to be close by the Z index. This is expected, because the CQ rating incorporates the effects of early spending. In effect, Table 2 shows the influence of unanticipated late spending by both candidates, as measured by the proxies of incumbent and challenger spending levels over the duration of the campaign. Put another way, the coefficients for spending were muted due to CQ's anticipation of their effects. Therefore, if anything, Table 2 underestimates the magnitudes of spending effects.

CONCLUSION

This article has examined a simple theoretical model of the spending game in an election between competing candidates for public office. That model strongly suggests a nonlinear relationship between expected incumbent share of the vote and spending by both candidates. It also illuminates the nature of the simultaneity bias introduced when OLS regressions use cross-sectional data pooled across both safe and competitive districts. The key insight is that, in equilibrium, total spending is continuously increasing in the expected closeness of the race. Because total spending reaches a maximum when expected incumbent share of the vote is 50%, the slope of spending with respect to incumbent vulnerability in this range is necessarily zero, so a sample

²⁵ The difference in magnitude is not statistically significant, however. Using conventional significance levels, one cannot reject the null hypothesis that incumbent and challenger spending effects are equal.

²⁶ The null hypothesis of equal spending effects for incumbents and challengers is rejected at the .01 significance level.

that includes only close races (expected incumbent vote share in the neighborhood of 50%) will be immune from the kind of simultaneity bias that plagues OLS regression on the full sample. This facilitates a clean estimate of incumbent and challenger spending effects.

We tested the model with veteran incumbent U.S. House races from 1974 to 1990. For close races, not only does incumbent spending pass the threshold of statistical analysis but also our estimate of the size of this effect is statistically indistinguishable from the effect of challenger spending. Thus, in close races, a given amount of spending wins about as large a share of the vote for an incumbent as for a challenger. We also show clearly how the simultaneity problem grows progressively more severe as the closeness of races diminishes. Two different measures of expected closeness are employed, and both yield identical conclusions. The first combines prespending long-term partisan strength in the district, short-term national forces, and lagged incumbent vote. The second uses the preelection CQ categorization of close, incumbentleaning, and safe races.

Both the theory and empirical findings complement the results reported in Erikson and Palfrey (1998), which presents a three-equation model of spending and makes two qualitative findings: (1) Incumbent and challenger spending is an increasing function of race closeness, and (2) the estimated effects of incumbent spending decline with seniority. Point 1 is a central prediction of our theoretical model, and point 2 is consistent with the fact that junior incumbents are typically more vulnerable than senior incumbents. In our vulnerable incumbent subsample (expected vote <52), nearly half (48%) were either sophomores or juniors, compared to only slightly more than one-third (36%) in the remaining races. As for the magnitude of spending effects, the estimates for veteran races in Erikson and Palfrey (1998) (and elsewhere in the literature) are smaller in magnitude than those reported here for close races. There are two possible reasons. First, because of pooling over all races, close and safe, the estimates elsewhere could be biased, even with carefully designed methods to correct for simultaneity. We showed here, both theoretically and empirically, that the degree of bias will vary with incumbent vulnerability in predictable ways, and this is not accounted for in those methods. Second, it may be that spending effects are indeed high in a tight race, due to its saliency to the voters and extensive media coverage. This interesting possibility would require a new approach to sort out differences in spending effects as a function of incumbent vulnerability.

To summarize, the results presented here have potentially important consequences for understanding the connection between money and the incumbency advantage. Incumbents outspend challengers and, according to our analysis, achieve roughly equal effectiveness per dollar in close races, where it matters most. In popular discussions, fundraising capacity is seen as a

major source of the incumbency advantage. Political scientists have hesitated to endorse this view, in part because it is difficult to estimate spending effects. Our findings have implications too complex to explore here, but they should finally put to rest any lingering doubt about the significance (and similarity) of incumbent and challenger spending effects in close races.

APPENDIX A

Consider our three-equation system with Z fixed at some level:

$$V = \beta_{\nu\nu}I + \beta_{\nu\nu}C + \varepsilon_{\nu}; \tag{15}$$

$$I = \beta_{IV}V + w_{I}; \text{ and}$$
 (16)

$$C = \beta_{CV}V + w_C. \tag{17}$$

Since β_{IV} and β_{CV} themselves vary as a function of expected vote, we fix Z (the instrument for expected vote) in the analysis below, so β_{IV} and β_{CV} can be treated as constant.²⁷ Our interest is in the bias in the OLS estimates of β_{VI} and β_{VC} , the spending effects on vote. The analysis below derives the asymptotic bias of the OLS estimate of β_{VI} . Calculation of the asymptotic bias of β_{VC} is done in a similar way.

To start, by successive algebraic substitution, we solve the simultaneous equations for I, V, and C and obtain the following exact expression for the OLS estimate of β_{VI} . The lowercase symbols indicate sample values of V, C, and I; observations in the sample are indexed by j; and b_{IC} is the sample bivariate regression coefficient of I on C.

$$\hat{\beta}_{VI}^{OLS} = \frac{\sum_{j} (i_{j} - b_{KC}c_{j})(v - b_{VC}c_{j})}{\sum_{j} (i_{j} - b_{KC}c_{j})^{2}}$$
(18)

$$OLS = \beta_{VI} + \frac{\sum_{j} (i_{j} - b_{IC}c_{j})\epsilon_{V_{j}}}{\sum_{i} (i_{i} - b_{IC}c_{i})^{2}}.$$
 (19)

Applying the rules of probability limit gives

plim
$$\beta_{VI}^{OLS} = \beta_{VI} + \frac{cov(I - \gamma C, \varepsilon_{V})}{var(I - \gamma C)}$$
, (20)

where γ is the expected value of b_{IC} . Some more algebra yields the following expressions:

$$cov(I, \varepsilon_{\nu}) = \frac{\beta_{I\nu}\sigma_{\nu\nu}^{2}}{1 - \beta_{I\nu}\beta_{\nu I} - \beta_{C\nu}\beta_{\nu C}},$$

$$cov(C, \varepsilon_{\nu}) = \frac{\beta_{C\nu}\sigma_{\nu\nu}^{2}}{1 - \beta_{I\nu}\beta_{\nu I} - \beta_{C\nu}\beta_{\nu C}}, \text{ and}$$

$$var(I - \gamma C) = \sigma_{I}^{2} - \gamma^{2}\sigma_{C}^{2}$$

which gives

plim
$$\beta_{\nu I}^{OLS} = \beta_{\nu I} + \frac{(\beta_{I\nu} - \gamma \beta_{C\nu})\sigma_{\mathbf{p}\nu}^2}{(1 - \beta_{I\nu}\beta_{\nu I} - \beta_{C\nu}\beta_{\nu C})(\sigma_I^2 - \gamma^2\sigma_C^2)}$$

= $\beta_{\nu I} + \Delta\Phi$, (21)

where

²⁷ Recall that β_{IV} and β_{CV} vary as a function of V, so, for any fixed Z, they are only approximately constant.

$$\Delta = \frac{\sigma_{\text{ev}}^2}{(1-\beta_{\text{IV}}\beta_{\text{VI}}-\beta_{\text{CV}}\beta_{\text{VC}})(\sigma_{\text{I}}^2-\gamma^2\sigma_{\text{C}}^2)}\text{,}$$

and

$$\Phi = \beta_{IV} - \gamma \beta_{CV}.$$

So the asymptotic bias of the OLS estimate of the incumbent spending effect on vote is simply $\Delta\Phi$. Because Δ is always positive, the sign of the bias is determined by the sign of Φ , which is governed by the signs of β_{IV} , β_{CV} , and γ .

It follows immediately that if $\beta_{IV} = \beta_{CV} = 0$, then the asymptotic bias disappears. This is indeed our main theoretical point, since our model implies that $\beta_{IV} = \beta_{CV} = 0$ when the expected vote is 50-50.25 Therefore, spending effects β_{VI} and β_{VC} can be estimated consistently by restricting attention to close races. This key result also would hold in more general models if one were to introduce additional parameters to index the degree of the simultaneity problem, as in Erikson and Palfrey (1998).

We next turn to signing the bias for the remainder of races in our sample, those in which the incumbent is expected to win with a safe margin. For these races, our model shows that β_{IV} and β_{CV} are both negative. Therefore, unless γ is very large, the sign of β_{IV} will determine the sign of the asymptotic bias. If $\gamma=0$ (as discussed in the text), then the sign of the bias is determined by the sign of β_{IV} , which is negative for safe races, by the game-theoretic model. The bias could not necessarily be signed were γ very large (and positive), but empirically it turns out that γ is small, which implies the intuitive result that OLS causes a downward bias in the estimated incumbent spending effect.

By similar argument, we can obtain the following expression for the bias in challenger spending effects:

$$\mathrm{plim}~\beta_{\nu c}^{\mathit{OLS}} = \beta_{\nu c} + \frac{(\beta_{\mathit{CV}} - \delta \beta_{\mathit{IV}}) \sigma_{\mathit{sv}}^2}{(1 - \beta_{\mathit{IV}} \beta_{\mathit{II}} - \beta_{\mathit{CV}} \beta_{\mathit{VC}}) (\sigma_{\mathit{C}}^2 - \delta^2 \sigma_{\mathit{I}}^2)},$$

where δ is the expected value of b_{CI} , and the asymptotic bias is determined by the sign of $(\beta_{CV} - \delta \beta_{IV})$. As with the incumbent, if $\beta_{IV} = \beta_{CV} = 0$, then OLS estimates are consistent. Otherwise, the bias is negative (which overestimates the effect of challenger spending, since $\beta_{VC} < 0$) unless δ is very large and positive, in which case the negative bias becomes negligible or possibly reverses sign. Empirically, it turns out that δ is much larger than γ , which helps explain why the data for safe races indicate a greater problem of simultaneity bias in β_{VI}^{OLS} compared to β_{VC}^{OLS} . By definition, $\delta = (\sigma_C^2/\sigma_I^2)\gamma$, and empirically $\sigma_C^2 > \sigma_I^2$ (even with Z held constant, as we have been assuming throughout). The latter fact has implications for the numerator and denominators of both bias terms. This is evident from inspection of equations 13 and 14.

The difference in magnitude between σ_C^2 and σ_I^2 is partly driven by fine details of the simultaneous system. From equations 15–17 we can decompose σ_C^2 and σ_I^2 as follows:

$$\sigma_I^2 = \beta_{IV}^2 \sigma_V^2 + \sigma_{NC}^2 + 2\beta_{IV} \sigma_{V,NF},$$

$$\sigma_C^2 = \beta_{CV}^2 \sigma_V^2 + \sigma_{NI}^2 + 2\beta_{CV} \sigma_{V,NC}$$

Due to the opposite signs of the spending-on-vote effects, the terms σ_{V,μ_I} and σ_{V,μ_C} have opposite signs, with $\sigma_{V,\mu_I} > 0$ and $\sigma_{V,\mu_C} < 0$. As a result, $2\beta_{IV}\sigma_{V,\mu_I} < 0$ and $2\beta_{CV}\sigma_{V,\mu_C} > 0$, thus expanding σ_I^2 while contracting σ_C^2 , even if everything else is symmetric between incumbents and challengers.

APPENDIX B

Our presentation of results in the text is drawn from regressions in which the control variables are summarized in terms of the predicted vote, or Z in the terminology of our statistical discussion. The measure Z is derived from a reduced-form regression that predicts the vote from its exogenous sources—the lagged incumbent vote, the district presidential vote, and dummy variables representing year, incumbent party, region (South/non-South), and their interactions. The regression equation that produces Z is shown in Table B-1.

In the text, the key regressions (tables 1 and 2) predict the vote, when it is expected to be close, from the two spending variables plus Z. Other specifications are possible. For the record, tables B-2 and B-3 present estimates from our key equations using regressions in which there is no control and in which Z is replaced by its 34 component parts. To provide complete information, and comparability with past findings, tables B-2 and B-3 also show the insignificant contribution of a dummy variable, whether the challenger held prior elective office. This dummy typically produces significant effects in regressions that use the full cross-section of races (Jacobson 1978).

The contribution (or lack of it) of the prior office dummy variable is noteworthy. Although it shows the expected negative effect on incumbent vote when all cases are combined, its effect is statistically insignificant when the regressions are conducted separately on each safeness category. Furthermore, the inclusion or exclusion of this dummy has no effect on our estimated coefficients on incumbent and challenger spending.

In theory, the separate components should predict the vote no better than their summary measure, Z. This is confirmed by the deterioration of the explained variance when the components are substituted for Z. Also as expected, we observe that the coefficients for incumbent and challenger spending are unaffected by the replacement of Z by its components. But also as expected, because substituting the components for Z uses additional statistical degrees of freedom, this substitution expands the standard errors of the coefficients. (Tables B-2 and B-3 present standard errors rather than t-values in order to highlight that the declines in significance are due to inflated standard errors rather than deflated regression coefficients.)

For the key regressions, the spending coefficients are insensitive to the control for Z, and they even show about the same values when there are no control variables whatsoever. In fact, except for the set of mcumbent-leaning districts, Z and its components make little contribution to the equations at all. This is as one would expect. When Z is held constant at values below 52% or between 52% and 55%, its range is sufficiently restricted for the presence of controls to be of little practical consequence. In effect, Z is already controlled. Similarly, the control matters little for districts that CQ rates as too close to call. The reason here is that CQ takes into account variables omitted by Z. Once a race is rated a toss-up, it matters not whether the verdict results from

²⁸ By continuity, the asymptotic bias is approximately 0 for close races in the neighborhood of 50-50.

²⁹ For the rare races in which the challenger is expected to win handily, the bias will have the perverse opposite sign, and incumbent spending effects would be overestimated.

TABLE B-1. Coefficients from Regression Equation Generating Z, the Predicted Vote incumbent Vote_{t=1} + 0.63 (0.02) × Incumbent Vote_{t=1} + 0.22 (0.02) × Presidential Vote, where α_{yrp} is the following matrix of year-region-party dummles

The Meaning and Measure of Policy Metaphors

MARK SCHLESINGER Yale University School of Medicine and Rutgers University RICHARD R. LAU Rutgers University

The apparent ability of the American public to form coherent assessments of policy options—while being largely ignorant of political institutions, actors, and ideology—remains a persistent puzzle for political science. We develop a theory of political decision making that helps resolve this puzzle. We postulate that both the public and political elites comprehend complex policies in part through "reasoning by policy metaphor," which involves comparisons between proposed alternative policies and more readily understood social institutions. Using data from 169 intensive interviews, we test claims about metaphorical reasoning for a particularly complex policy domain: health care reform. We demonstrate that our hypothesized policy metaphors are coherent to both elites and the general public, including the least sophisticated members of the public. We further show that elites and the public share a common understanding of the relevant policy metaphors, that metaphorical reasoning differs from other forms of analogic reasoning, and that metaphorical cognition is distinct from ideological orientation.

he apparent gap between political elites and the general public in their understanding of public issues remains troubling for political science and for modern democracy. Public ignorance and apathy challenge advocates of a more participatory politics, who have responded either by trying to diagnose the problem more carefully (Lasch 1995; Sandel 1996) or by formulating strategies to encourage more effective and comprehensive public involvement in political debates (Barber 1984; Etzioni 1993; Fishkin 1995).

The challenges to contemporary political science are equally profound. These are often portrayed as a paradox between the aspirations of democratic theory and the reality of public opinion research, the latter reflected in attitudes that are transitory and inconsistent (Converse 1964; Zaller 1992). In our assessment, however, a more fundamental paradox appears within research on public opinion. We have, on the one hand, compelling evidence that the public is largely unaware of political debates, institutions, or lexicons (Delli Carpini and Keeter 1996). These studies suggest that the average American knows "virtually nothing about the public issues that occupy officials from Washington to city hall" (Ferejohn 1990, 3). On the other hand, there is equally compelling evidence that the American public understands social policy at some level, which is reflected in detailed studies of the ways in which Americans describe and discuss public policy (Gamson 1992; Graber 1984); the public may even influence that policy, which is reflected in shifts in aggregate public opinion that often precede related shifts in elite decision making (Page and Shapiro 1992).

Mark Schlesinger is Associate Professor of Public Health, Department of Epidemiology and Public Health, Yale University School of Medicine, New Haven, CT 06520. Richard Lau is Professor of Political Science, Rutgers University, New Brunswick, NJ 08901. Both authors are associated with the Institute of Health, Health Care Policy, and Aging Research at Rutgers

This research was supported in part by a grant from the Robert Wood Johnson Foundation. We thank Licia DeVivo, Caroline Heldman, Ben Peck, Judithanne Scourfield, and Tracey Thomas for conducting the mterviews; and Don Green, Colleen Grogan, Michael Gusmano, Larry Jacobs, and members of the Health Policy Investigator program, who commented on earlier versions of his paper.

Political scientists have offered a variety of explanations for these seemingly inconsistent findings (Neuman 1986; Sniderman, Brody, and Tetlock 1991; Zaller 1992), but none is entirely consistent with the evidence, and all rely on efforts to define how the formation of public opinion is constrained relative to elite judgments. A more promising approach involves identifying cognitive processes for assessing social policy that are shared by political elites and the general public. If such processes can be identified, they can help explain common patterns of reasoning by policymakers and the public and may reveal ways to promote richer discourse about the causes of and solutions to societal problems. Any proposed cognitive process must be able to explain how the average citizen can assess policy matters without recourse to much knowledge of the political context or to the sort of ideological frameworks that help shape elite reasoning. It also must describe a process of reasoning which is feasible for a populace that devotes little time or attention to social problems. Furthermore, the same framing must prove useful for policy elites, despite their greater knowledge of political matters and their greater reliance on ideology.

We believe that a promising candidate exists, which we will refer to as "reasoning by policy metaphor." This political calculus bases decisions on comparisons between complex policy issues and more readily understood social institutions. We hypothesize that every society has a set of commonly understood ways of arranging social institutions and judging the effectiveness of their performance. Citizens in each country whether members of the general public or political elite—share a broad understanding of the nature of these "templates" for collective activity. Each of these arrangements constitutes a sort of archetype, an ideal against which people compare the consequences of actual policies or project the expected outcomes of proposed policy reforms. It is this process of comparison that makes the reasoning metaphorical.

Our claim that elites and the public think about policy in similar ways seemingly conflicts with the conventional wisdom of decades of political science research, which consistently portrays elites as basing

their decisions on political ideology and characterizes the American public as ideologically naive (Converse 1964; Jennings 1992). We do not disagree with this portrayal of political ideology. We argue that an additional set of conceptual frames complement the role of ideology for elite decision making and largely replace ideological reasoning in the public's assessment of policy alternatives. Our goal is to explore metaphorical reasoning and demonstrate how it differs from more familiar constructs of reasoning by analogy and political ideology.

REASONING BY POLICY METAPHOR

Political scientists have long recognized the use of metaphors in political discourse (Edelman 1964; Landau 1961; Zashin and Chapman 1974), elite policy debates (Rein and Schön 1994; Shimko 1994), and media presentations about social problems (Lakoff 1996; Stone 1988). But researchers have been much less successful at establishing whether the use of metaphors reflects fundamental cognitive processes as opposed to simply figures of speech. Indeed, one generally sympathetic observer recently concluded that he had "yet to see a means of determining whether metaphors are playing a cognitive role" (Shimko 1994, 663). Identifying and measuring this cognitive role is a primary focus of this article.

The Distinctive Features of Metaphorical Reasoning

Metaphorical reasoning shares important similarities with reasoning by analogy, which has been widely studied in both foreign (Jervis 1976; Khong 1992; Vertzberger 1990) and domestic (Houghton 1998; Neustadt and May 1986) policy. Both metaphors and analogies translate situations that are complicated or novel into others that are more familiar or better understood. Such comparisons reduce cognitive burden and reveal potential alternatives for addressing problems that might otherwise bewilder decision makers (Holyoak and Thagard 1995).

But past studies suggest that metaphorical and analogic reasoning differ in at least five ways. First, analogies are drawn within domains, metaphors across domains (Kittay 1987; Shimko 1994). Reasoning by analogy, policymakers compare contemporary conflicts to wars fought in the past (Khong 1992), current urban crises to similar episodes in earlier years or other jurisdictions (Houghton 1998), or ongoing crises of presidential authority to earlier episodes in which impeachment was pending or threatened. Reasoning by metaphor, in contrast, policymakers describe health issues in terms of war (Sontag 1989) or ecology (Annas 1995), interpret international conflicts from epidemiology perspectives (Glad and Taber 1990), and liken urban crises to weeding a garden (Rein and Schön 1994). Metaphorical reasoning thus involves what we term "concrete embodiment." The implications of comparing across domains—comparing a political campaign to a horse race, for example—depend in part on the decision makers' actual experiences with horse races. Those living in eras or jurisdictions in which races are fixed will see very different connotations than those who experience races as fair and carefully regulated. The meaning of the metaphor depends on this translation to concrete experience.

Second, analogies can, at least in principle, be exact. One situation may be so much like another that it follows that successful policies under the first circumstances are very likely to prosper under the second. Indeed, the prescriptive power of analogies largely depends on the closeness of this "matching" (Holyoak and Thagard 1995). In contrast, metaphorical comparisons are always partial and are so recognized by decision makers. Those who liken surrogate motherhood to "baby selling" argue for prohibition on the same grounds that most countries outlaw slavery. But proponents make a different and equally metaphorical comparison, arguing that the surrogates' contracts for use of their bodies are similar to other labor contracts quite common in contemporary society. Each side recognizes that the comparisons illustrate parts-although potentially vital parts-of the meaning of surrogacy arrangements (Stone 1988).

Third, analogic reasoning among political elites has been shown to embody several distinct cognitive functions: description, prediction, and prescription (Khong 1992). Metaphorical reasoning also can have both descriptive and prescriptive implications. Indeed, metaphors can generate a "normative leap... from data to recommendations, from fact to values, from 'is' to 'ought'" that can powerfully shape the preferences of decision makers (Rein and Schön 1994, 94). Yet, metaphors generally are less useful than analogies as sources of prediction. Because each metaphor is a partial comparison, there is no reason to presume that the particular aspects highlighted by a metaphor are causally related to future outcomes (Shimko 1994).

Fourth, metaphorical reasoning is more likely to embody an affective component than are analogical comparisons, which are typically portrayed as "cold cognition" (Khong 1992, 225). It has long been recognized that much of the power of metaphors involves the emotional responses that they can induce in a variety of political or social contexts (Edelman 1971; Zashin and Chapman 1974). Moreover, the partiality of metaphors invites an affective response (Crocker 1977). Emotional responses provide a stimulus to focus the attention of decision makers on particular aspects of complex social issues. In this way, policy metaphors introduce an affective dimension comparable to the "likability" heuristic that has been demonstrated to influence stands on political issues (Sniderman, Brody, and Tetlock 1991). In a similar manner, the affective dimension of policy metaphors helps less sophisticated decision makers select among policy alternatives, based on their emotional response to the institutional templates.

Finally, analogies and metaphors are likely to be the heuristic of choice under different circumstances. Analogies are most frequently invoked for understanding events that are novel or take place with limited frequency (Vertzberger 1990). "Although it is easy to compare one discrete situation with another, it is difficult to analogize through time in a continuous situation" (Houghton 1998, 283). Metaphors, in contrast, appear equally useful under both novel circumstances (Sontag 1989; Stone 1988) and when addressing long-standing social problems (Rein and Schön 1994; Szasz 1974).

A Model of Reasoning by Policy Metaphors

We believe that all cultures are constructed around a core of social institutions, familiar to all citizens. By "institutions," we refer to complex combinations of norms, practices, and organizational arrangements that shape various collective activities. Our understanding of these institutions is shaped by a combination of culturally transmitted "stories" (Nimmo and Combs 1980) and personal experience with the most common embodiments of each institution (Gamson 1992). For example, the meaning of "family" is a product of one's own family history (Lakoff 1996) as well as the images of family constructed by the media and other sources of cultural authority (Coontz 1992). Because these institutions are familiar to all members of the culture, they are cognitively accessible to both the public and elite decision makers.

We argue that these institutions become lenses or templates for interpreting emerging social problems and evaluating proposed policy solutions. Psycholinguists often talk about the target of metaphors, the more familiar object to which a less familiar or ambiguous phenomenon is compared. The institutional templates described above are the targets when people reason by policy metaphor. Citizens understand problems and policies by comparing their implied consequences to the societal arrangements and functional norms that are implied by each of these institutional templates. This process of interpretation has been recognized for individual institutions by a number of analysts; see, for example, Lakoff (1996) on the family, Rodwin (1995) on fiduciary obligations, Fowler (1991) on community, and Stone (1988) on societal rights. These comparisons are metaphorical precisely because the social institutions—which embody norms, expectations, and routinized practices—exist at a different level of abstraction and social structure than do the social problems in question, which reflect behaviors and their consequences for those involved.

This hypothesized reasoning process can perhaps best be explained by illustration. It is often claimed that a particular good or service (e.g., a peaceful death, housing, a decent retirement income) ought to be considered a societal right (Glendon 1991; Scheingold 1974). Clearly, there are no explicit rights to these goods embodied in any constitution or legal code in the United States. But in thinking about how we might allocate certain goods differently if they were rights, we come to think about the moral terms in which we should judge existing allocations of goods and services, to consider whether existing arrangements are problematic precisely because they do not treat health care

or housing in the same manner as claims to a lawyer for criminal trials or access to public schools (Dougherty 1989).¹ These comparisons are metaphorical in that they are understood to be partial—a particular social issue is recognized as having some attributes of rights, but not all (e.g., being written into the Constitution). Their incompleteness allows for these goods to be seen in the light of other metaphors as well as rights.

From these postulated patterns of cognition we derive our first testable hypothesis.

HYPOTHESIS 1: Both public and elites will make use of multiple policy metaphors for constructing interpretations of policy issues. They will share a common understanding of the broad meaning of those metaphors in specific policy contexts.

We also hypothesize that metaphorical reasoning occurs in two distinct stages, the first descriptive, the second prescriptive. To avoid the vagueness of past treatments of cognitive processes in political science, such as "schemas," and to differentiate clearly metaphorical reasoning from older notions of "attitudes" (Kuklinski, Luskin, and Bolland 1991), it is essential that these two stages are in fact differentiable—that a person can understand the relevance of a metaphor in a policy domain without necessarily agreeing that it represents a desirable direction for policy reform. The first assessment represents the "coherence" of the metaphor in a particular policy domain. The second judgment we will refer to as the "support" for the metaphor in that domain. This suggests our second testable hypothesis.

HYPOTHESIS 2: The coherence of a metaphor in a particular policy domain in general will be unrelated to support for that metaphor as a prescription for future policy.

We believe that the coherence of metaphorical reasoning can be assessed by identifying the cognitive processes hypothesized to be a part of metaphorical comparisons and then testing for their congruence in actual decision making. Our analysis above suggests that metaphorical reasoning may invoke norms of equity, emotional responses, and concrete translations of the institutional template into organizational arrangements that have been directly experienced by the decision maker. We believe that another crucial aspect of the description of a social issue involves causal attributions. Evidence suggests that such attributions are an important influence on the decisions of both the general public (Iyengar 1991; Skitka and Tetlock 1993) and policy elites (Sabatier and Hunter 1989). Iyengar (1991, 8) draws the distinction between attributions of responsibility for causing the problem (causal respon-

¹ More precisely, courts and policymakers have identified some natural ("negative") rights in health care, that is, the right not to have certain health-related practices restricted by others. Abortion is one example. Unlike legal representation, however, there is no established human ("positive") right to health care, in the sense that government is required to ensure the availability of medical services, other than for prisoners and other wards of the state.

sibility) and attributions of responsibility for its remedy (treatment responsibility).

How might policy metaphors assist decision makers in assigning responsibility? They may do so in several ways. First, some (although not all) institutional templates incorporate within them strong allocations of treatment responsibility. For example, when a particular good and service is described as a societal right, it is commonly perceived that the federal government bears responsibility for remedying situations in which individuals cannot gain access to those goods (Glendon 1991). Other templates highlight causal responsibility. When a particular good is described as a professional service, there is a strong presumption that the good will be allocated based on scientific definitions of need (Kultgen 1988). Failures within this context are failures of knowledge, and their remedy is linked to selfcorrective efforts from within the profession itself (Krause 1996).

We thus hypothesize that metaphorical reasoning involves five distinct cognitive processes. The coherence of a metaphor will be measured in terms of the congruence among these processes.

HYPOTHESIS 3: Metaphorical reasoning will be evident in respondents' assessments of (a) causal responsibility, (b) treatment responsibility, (c) norms of fairness, (d) comfort with particular institutions, and (e) concrete comparisons to relevant institutional templates.

The second stage of metaphorical reasoning involves prescription. Each metaphor invokes its own "normative leap," as decision makers respond to the emotional and ethical bases embedded in the target of the metaphor, the institutional template. As in the descriptive phase, we postulate that there will be more than one guiding metaphor for most decision makers, which allows for diverse although broadly compatible directions for policy reform.

Hypothesis 4: In any given policy domain, individuals may support more than one metaphor as defining an appropriate path for future policy.

The invocation of multiple policy metaphors suggests another important stage in the reasoning process. For any given policy domain, particular metaphors will be judged as relevant in part because of their intrinsic qualities (the coherence of the metaphor, as defined above), in part related to whether they are seen as compatible or conflicting with other relevant institutions. "Compatibility" refers to the "fit" among metaphors in the various cognitive dimensions associated with metaphorical reasoning. For example, two metaphors may appear incompatible because each invokes different standards of fairness. The norms of desert associated with markets are often seen as incompatible with the more need-oriented practices associated with community (Schlesinger 1997) or family (Hochschild 1981). For the same reasons that members of a culture share understanding of particular institutional templates, they also should share an assessment of compatibility among metaphors. This generates a "logic" of metaphorical reasoning, complete with transitive properties and other operating principles.

HYPOTHESIS 5: There are broadly shared understandings among both the general public and elites about which policy metaphors fit with one another.

Decision makers may, of course, have access to heuristics other than policy metaphors. In particular, ideology may guide elite policy choices. Elite decisions are certainly more ideologically consistent than are those of the public (Converse 1964; Jennings 1992). But even for those with strong ideological guideposts, metaphors can provide useful insights that go beyond the allocations of responsibility between public and private sectors or between individual and collective action that are the mainstay of conventional American ideologies (Lakoff 1996; Tetlock and Mitchell 1993). We will test explicitly for differences between reasoning associated with policy metaphors and reasoning based on ideology to determine whether the two represent distinctive cognitive processes.

METHODS

Our general claim is that policy metaphors can assist reasoning about any complex social problem. To provide an initial test for our hypotheses, however, it is useful to focus on a particular policy domain. We begin by selecting a policy area and identifying the array of institutional templates potentially relevant for that domain. It is necessary to develop methods for assessing the *coherence* and *compatibility* of metaphorical thinking. We describe these methods and their application to a sample of public and elite respondents.

An Application to Health Policy

Health policy was selected as the domain for this study because at the time the data were collected (primarily summer 1995) health care reform was an issue of considerable salience. Polls indicated that much of the public followed these debates and formulated opinions about appropriate reforms, although people were often confused by the complex details of reform proposals (Blendon, Brodie, and Benson 1995; West, Heith, and Goodwin 1996).

The salience, complexity, and multivalent nature of the health care reform debate make it an attractive test for policy metaphors. If our model is correct, then policy metaphors have the potential to clarify what people saw as the failings of the existing system, to reduce the complexity of the debate, and to make sense of the ways in which competing proposals might fit together. To operationalize these tests, we need to establish which institutional templates may have been invoked.

Templates Relevant to Health Policy. We conducted an extensive review of health policy proposals over the past two centuries of American politics. From this review emerged five conceptions of the health care

system, each of which defines a distinctive set of core institutions for allocating medical care.²

The earliest metaphorical referents, dating back to the colonial period, treat health care as a "community obligation" (Schlesinger 1997). An outgrowth of the British poor laws, these early legislative initiatives made all infirm and indigent residents who lacked family caregivers the responsibility of the town or village, with the standards of appropriate care being locally determined (Grob 1994). Although the scope of community responsibility and authority varied considerably over the subsequent two centuries, notions of community responsibility motivate contemporary federal programs that support community health and mental health centers (Sardell 1988) and remain a powerful rhetorical frame for assessing the performance of the health care system (Light 1997). Notions of community emphasize the heterogeneity of health needs in varied subpopulations and the desirability of decentralized allocation of health care resources.

During the latter part of the nineteenth century, health care grew increasingly market oriented as different schools of medicine competed for legitimacy (Rothstein 1979), hospitals competed to attract patients (Rosenberg 1987), and individual physicians engaged in aggressive practices to market their services (Rosen 1983). In keeping with the consensus favoring laissez-faire economic policies at that time, government policymakers assumed a basically passive role. We refer to this conception as the "marketable commodity" metaphor of health care, which reemerged to guide policymaking in the early 1980s (Seay and Vladeck 1988). It emphasizes the benefits of individual choice and resource allocations based on individual preferences, with deservingness based on productive contributions to the economy.

As was true for a variety of industries at the turn of the century, the consequences of unconstrained market forces alarmed policymakers concerned about medical care. In keeping with the general Progressive orientation toward scientific reform, state policies encouraged a consolidation of professional control along with more stringent standards for professional training (Rothman 1980). The ethos of mainstream American medicine shifted to that of medical care as a "professional service," an image that subsequently dominated the thinking of doctors and policymakers for the first half of the twentieth century (Starr 1982). Medical professionalism places primacy on scientific definitions of need and the importance of professional discretion in allocating services.

It was not until almost mid-century that the notion of health care as a basic "societal right" was first clearly enunciated in American politics by Franklin Roosevelt. This metaphor implicitly redefined the norms for the performance of the health care system toward a greater concern with equal access and a greater share of responsibility for the federal government. Concepts of a right to health care quickly grew in importance, which paralleled a growing social concern for other human and civil rights (Schlesinger and Lee 1993). Although this perspective was most clearly stated in policy debates during the 1960s and 1970s, public opinion polls suggest that the idea of a right to health care continued to garner strong support through the mid-1980s (Gabel, Cohen, and Fink 1989). Notions of health care rights embody standards of minimum adequate packages of services and emphasize norms of equal access.

The fifth metaphor to appear in elite commentary on health policy is found in debates only in the last decade. Employers are viewed as intermediaries who assure the availability of health care, much in the way that geographic communities played this role in earlier periods of history. Although employer involvement in providing health insurance emerged largely as the unintended byproduct of federal policies in the period between World War II and the Korean War (Silow-Carroll et al. 1995), it is consistent with growing corporate involvement in a wide range of "social benefits" (Stevens 1988). Beginning with congressional deliberations over health care reform in the late 1980s, employer involvement was at least partially translated to employer responsibility, as political leaders chastised companies that failed to provide health insurance for their workers (Field and Shapiro 1993). As with the community metaphor, this fifth perspective emphasizes the desirability of decentralized allocation of resources, although with a stronger emphasis on equity defined in terms of deservingness.

Institutional Templates and Metaphorical Reasoning. Do invocations of these five institutions really involve metaphors? At first glance, the claims seem more literal than metaphorical. Would not the enactment of national health insurance create an actual "right" to health care? When individuals choose among health plans, are they not literally treating medicine as a commodity? It is our contention that the apparent literalness of these comparisons masks their true metaphorical nature. The comparisons are metaphorical in three distinct senses. First, the appeal of the five institutional templates is not in terms of performance but of the ideals they embody. For example, the Federal Trade Commission became an advocate for markets in medical care based on textbook notions of consumer empowerment, not on any actual evidence that market choices lead to better treatment (Starr 1982). Second, the translation of proposed services to institutional templates will always be incomplete. Health care can never be fully a "right" because the social determinants that shape the efficacy of medical treatment are too complex for any conceivable scope of government responsibility. Health care can never be completely a marketable commodity, because its "caring" aspects can be no more translated into monetary terms than can any other loving relationship. Third, the partiality of the "fit" with each of these institutional templates—whether cast in terms of rights (Dougherty 1989), markets (Annas 1994), or community (Light

² A more detailed review of the emergence and evolution of these five metaphors is presented in Schlesinger, Lau, and Thomas n.d.

1997)—is explicitly understood even by the most fervent advocates. The translations are not literal and are not meant to be. They thus allow complex combinations of templates as a guide to health care reform.

Methods for Assessing Metaphorical Reasoning

To test our hypotheses about policy metaphors, we need to assess how actual elite and public decision makers view health care reform. It is necessary to translate these broad institutional templates into a set of more specific descriptions. For each template, we constructed five statements that embody an attribution of causal responsibility, an allocation of treatment responsibility, an evocation of particular norms of equity, a description of an affective response ("comfort" with particular institutional arrangements), and a concrete comparison to another familiar policy domain which served as an exemplar for that template. See Appendix A for a complete listing of these statements.

Measuring Coherence. Although we believe that metaphorical cognition is distinct from other forms of attitude formation, respondents will still hold attitudes (i.e., agree or disagree) with particular aspects of each metaphor. One measure of metaphorical coherence could be "attitudinal coherence," the extent to which respondents who agree with any one statement relevant to a metaphor also tend to agree with the other four statements. As Kuklinski, Luskin, and Bollard (1991) point out, however, if we are to assure that policy metaphors are not simply another form of "old wine in new bottles," we need a way to measure cognitive coherence that is distinct from these more conventional assessments of attitudes. The method used here we refer to as "grouping" coherence. This reflects the extent to which the statements associated with each template seem to the respondent to "fit together" into a coherent picture of the health care system, apart from whether those statements are favored as a direction for reform. To assess metaphorical coherence, participants were presented—in randomized order-with all 25 statements about the five institutional templates,³ each on a separate card. Their initial task was to read each card and indicate the extent to which they agreed or disagreed with the statement, taken in isolation. At this point participants could ask the researcher coordinating the interview to clarify the meaning of any statement.

Participants were then instructed to group the cards into a set of piles, each of which represented for them a distinctive approach to structuring the health care system. They were explicitly told that this

grouping should *not* be based on the extent to which they agreed with particular statements, but on the ways in which the statements seemed to fit with one another. Participants were allowed to establish any number of groupings that they considered sensible; on average, 5.4 distinct groups were constructed. Respondents were given as much time as they desired to create groups that they considered satisfactory.

Sorting exercises have been used in various contexts to measure complex social and political attitudes (Brewer and Lui 1996; Conover and Feldman 1984). But these past studies were empirically rather than theoretically focused; groupings that emerged from the sorting process were assigned labels and interpreted after the fact. Our strategy is deductive rather than inductive. We postulate that statements will be grouped in a particular manner and test for the emergence of these groupings.

Attitudinal coherence can be assessed through familiar methods of confirmatory factor analysis (CFA), by treating agreement with the five statements associated with each template as distinct manifest indicators of support for that metaphor. Assessing grouping coherence requires somewhat less conventional methods. Hubert and Levin (1976) developed a statistical test (the "Quadratic Assignment Paradigm"-see also Hubert and Schultz 1976) for determining the probability that a particular sorting configuration will occur, compared to the probability that the configuration would have emerged from a random process of sorting. Their test statistic (Λ if there is only one theoretically defined grouping, Δ if the theoretical matrix is partitioned into $g \ge 2$ distinct subgroups) is based on the association between two matrices; the first is a theoretical matrix of 0s and 1s indicating what items should be grouped together, and the second is an observed matrix of the proportion of time each pair of items is placed in the same group. Asymptotic properties have been developed that allow for the calculation of a z score to determine the probability that particular observed configurations would have occurred by chance.

The Hubert-Levin measure, like CFA, provides an aggregate statistic for how well the observed data fit the hypothesized model for a group of respondents. For several of our hypothesis tests, however, it is more useful to have measures of attitudinal and cognitive coherence for individual respondents. For these purposes, we used several additional measures. Attitudinal Coherence is measured straightforwardly at the individual level by the variance in agreement ratings for the five statements associated with each metaphor. Lower variance means more attitudinal coherence. To assess Grouping Coherence at the individual level, however, it was necessary to develop a new measure, which we will label here *omega* (Ω) . For each policy metaphor, omega is calculated as the proportion of correctly grouped statements (i.e., the five that belong with a given metaphor) minus the proportion of statements that do not "belong" to that metaphor but were

³ Also presented were a dozen other "cover" statements about the health care system that were not linked to any of the five metaphors. These statements were included to increase the complexity of the sorting task and create a more realistic representation of the sort of claims made during the health care reform debate. The cover statements are not included in the subsequent measures of cognitive coherence, since we had no a priori expectations about how they would group or not group with one another.

included in that grouping. See Appendix B for more details.

Assessing Support and Compatibility. After grouping the separate statements in whatever manner they deemed sensible, respondents were shown summaries of the hypothesized metaphors that included all five hypothesized statements. They were asked to indicate the extent to which they agreed or disagreed that a particular metaphor represented a "good direction" for the future of the American health care system using a conventional five-point scale. We will refer to these as measures of overall support for (the application of) the metaphor. Respondents were then asked to consider the extent to which pairs of metaphors seemed compatible with one another, with responses on a fivepoints scale ranging from "completely compatible" to "completely incompatible." All ten possible pairings of the five hypothesized policy metaphors were considered. "Compatibility" was left undefined and thus could have been interpreted in different ways by respondents.

Subjects

To collect data on metaphorical reasoning, we identified two groups of respondents. The first was a convenience sample of the general public involving 119 participants. Although it was not possible to draw a random sample for this part of the study, recruitment strategies were adopted to ensure adequate variation in age, socioeconomic status, and political ideology. To reduce the idiosyncratic influences of residence in a particular community, participants were drawn from five sites in four states—Connecticut, New York, New Jersey, and Pennsylvania. General public subjects were 55% female and 17% nonwhite. The average age was 45, and two-thirds had a college education.

To assess the sophistication of thinking about health care issues, participants were asked how extensively they had followed the debate over health care reform and how informed they believed themselves to be on these issues. Using these two questions, we categorized participants according to their knowledge of health policy. Those who did not feel at least somewhat informed and also had not followed the reform debate (23.5%) were labeled "low sophistication"; those who considered themselves very informed or who reported following the debate very closely were labeled "highly sophisticated" (24.6% of the sample). The remaining 52% were considered moderately informed.⁵

The elite sample was composed of individuals sophisticated in health policy. Congressional staff and officials in the executive branch who participated in the formulation of the Health Security Act were chosen. Representatives of interest groups were identified from a published compendium of people considered influential in the policymaking process (Faulkner and Gray 1995). The elite sampling frame was divided into provider groups, patient groups, industry, and government; a random sample of 80 potential respondents was drawn. Fifty elite respondents were successfully interviewed, a response rate of 62.5%.

RESULTS

The Coherence of Policy Metaphors Applied to Health Care

The primary goal of our analyses is to illustrate the cognitive role that metaphorical reasoning plays in helping people make sense of complex policy issues. To do that we will demonstrate both what metaphorical reasoning is and what it is not. To begin with the affirmative, our primary evidence for the existence of metaphorical reasoning comes from the grouping activity. But will either elites and/or the general public group statements in ways compatible with the five institutional templates?

The relevant data are presented in Table 1. Because there is no intuitive way to gauge the magnitude of Hubert and Levin's Λ and Δ , the table also presents the asymptotic z score associated with these statistics. The larger the z score, the less is the likelihood that the observed grouping occurred by chance, and the more consistent the observed data are with our hypothesized groupings. We present data separately for policy elite and the total general public samples, then for the general public sample broken down by level of sophistication.

Considering all metaphors taken together (the top row of Table 1), the grouping scores (Δ) provide strong evidence of the salience of metaphorical thinking for both public and policy elites, including the least sophisticated members of the public. Although there is variation in the levels of cognitive coherence across these different subgroups (e.g., elite groupings are more coherent than those of the general public), the level of metaphorical coherence appears as high among the moderately informed public as among the most sophisticated members of the public. These data provide strong support for hypothesis 1.

If we look separately at the coherence of each of the five metaphors, we continue to see commonalities across the subgroups, although some differences in metaphorical reasoning emerge as well. The marketable commodity notion is consistently the most coherent metaphor applied to contemporary health policy; employer responsibility is the least coherent. The societal rights metaphor displays the sharpest contrast across groups; it is most strongly coherent for the elite respondents, but much less so for the public, particularly the least sophisticated.

We can look at the coherence of policy metaphors in a second way. Hypothesis 3 states that metaphorical reasoning will be evident in the five cognitive processes identified above (assessment of causal and of treatment

 $^{^4}$ In a similar manner, one can construct a grouping score Ω for each separate cognitive process—such as causal responsibility, ethical standards, concrete comparisons—as the proportion of statements for each process correctly matched with their appropriate metaphors, minus the proportion of mismatched statements. We use such a measure to help test hypothesis 3.

⁵ The results reported below change little if we divide the general public by education rather than by our measure of sophistication.

TABLE 1. Cognitive (Grouping) Coherence of Policy Metaphors, by Subgroup of Respondents

				abgroup of 1100	<u> </u>
	Pollcy	General	Public	, by Level of Sophi	stication
	Elites (N = 50)	Public (N = 119)	High (N = 29)	Medlum $(N = 61)$	Low (N = 28)
Across all 25 Items and all five metaphors	$\Delta = 24.52$ $z = 12.13***$	$\Delta = 20.53$ $z = 10.47^{***}$	$\Delta = 20.85$ $z = 9.32^{***}$	$\Delta = 21.18$ $z = 10.29***$	$\Delta = 18.25$ $z = 8.36***$
Societal Right metaphor	$ \Lambda = 6.12 z = 7.21*** $	$ \Lambda = 3.59 z = 3.07** $	$ \Lambda = 3.81 z = 3.08** $	$ \Lambda = 3.72 z = 3.11** $	$ \Lambda = 3.07 z = 1.99 $
Community Obligation metaphor	$ \Lambda = 4.16 $ $ z = 3.77^{***} $	$ \Lambda = 3.74 z = 3.43*** $	$ \Lambda = 3.81 z = 3.08** $	$ \Lambda = 3.62 z = 2.89** $	$ \Lambda = 3.54 z = 3.15** $
Employer Responsibility metaphor	$ \Lambda = 3.24 z = 2.15* $	$ \Lambda = 3.43 z = 2.66* $	$ \Lambda = 3.56 z = 2.50^* $	$ \Lambda = 3.38 z = 2.36* $	$ \Lambda = 3.21 z = 2.35^* $
Marketable Commodity metaphor	$ \Lambda = 6.12 $ $ z = 7.21^{***} $	$ \Lambda = 5.70 z = 8.32*** $	$ \Lambda = 5.41 z = 6.64*** $	$ \Lambda = 6.00 z = 8.24*** $	$ \Lambda = 5.39 $ $ z = 7.76*** $
Professional Service metaphor	$\Lambda = 4.88$ $z = 5.03^{***}$	$\Lambda = 4.08$ $z = 4.28***$	$ \Lambda = 4.26 z = 4.07*** $	$\Lambda = 4.47$ $z = 4.80^{***}$	$ \Lambda = 3.04 z = 1.91 $

Note: The measure of sophistication was messing for one general public respondent, who is excluded from the subgroup breakdown. A and Δ (the latter is appropriate when Items are divided into subgroups) can be thought of as unnormalized correlation coefficients indicating the degree of similarity between an observed co-occurrence matrix of item groupings, and a structure matrix of theoretically determined item groupings. Significance levels noted in the table assume a normal distribution. The small N sampling distributions of Λ or Δ are unknown, however, and the noted significance levels may be overly optimistic, particularly for the subgroup breakdown of the general public. If we take a very conservative approach and use Tchebychell's inequality, only z accores greater than 4.5 are significant at the p < 0.5 level. The true sliphs level will be less than or equal to that resulting from Tchebychell's procedure p < 0.01, p < 0.01, p < 0.01, p < 0.01, p < 0.01.

responsibility, norms of fairness, comfort with particular institutions, and concrete comparisons), and the analysis just presented is based on respondents' grouping of items representing these different processes. But are each of these individual processes equally strongly linked to the overall metaphor? We constructed separate measures of grouping coherence for causal responsibility, treatment responsibility, ethical norms, emotional response, and concrete comparisons, in each case averaged across the five policy metaphors. This measure equals 0 if the statements are grouped randomly or combined into a single aggregated grouping; it equals 1 if the statements are grouped in a way completely consistent with the hypothesized metaphors. Here we are not testing whether the statements about each process are grouped together across metaphors; rather, we test the extent to which statements about each cognitive process (e.g., causal responsibility), considered separately, are correctly placed with the statements about other processes related to that metaphor (see Table A-1 for statements organized by metaphor and cognitive process).

The results are presented in Table 2. They suggest that all five of the hypothesized processes have some salience for metaphorical reasoning about policy, although there are some clear differences across levels of cognitive sophistication. Among the least sophisticated of the general public, all five processes reflect only modest levels of consistency across the metaphors (that is, being appropriately grouped with their corresponding metaphor), with little differentiation among the five. In contrast, for the remainder of the public respondents, three cognitive processes stand out as significantly more salient: assignment of treatment responsibility, invoking an affective response (noted as personal familiarity/comfort), and establishing a concrete comparison. There were no distinct differences in reasoning between moderately and highly sophisticated members of the public. Among the elite respondents, all five processes were noticeably more likely to be

TABLE 2	Identification	of Cognitive	Process	Statements	with	Appropriate I	Metaphor

			Public, I	by Level of Soph	Istication
	Policy Elites (N = 50)	General Public $(N = 119)$	High (N = 29)	Medlum (N = 61)	Low (N = 28)
Diagnosis of Problem			<u> </u>	<u> </u>	
(Causal Responsibility)	0.23	0.11	0.09	0.14	0.12
Treatment Responsibility	0.42	0.27	0.28	0.31	0.23
Norms of Equity	0.28	0.16	0.16	0.18	0.14
Personal Familiarity/Comfort	0.39	0.22	0.24	0.25	0.17
Concrete Comparison	0.40	0.24	0.25	0.27	0.17

Note Table entries are the mean grouping coherence score Ω , based on the proportion of each of the five types of statements that were correctly grouped with their corresponding metaphors, less the proportion of statements grouped with them that did not belong to the metaphor. As are the same as reported in Table 1. For more discussion of the construction of this measure, see Appendix B.

		ollcy Metaphors	Public,	by Level of Sophis	stication
	Pollcy ⊟ttes (N = 50)	General Public $(N = 119)$	Hlgh (N = 29)	Medlum $(N = 61)$	Low (N = 28)
Societal Right	0.85	0.45	0.33	0.50	0.41
Community Obligation	0.37	0.66	0.68	0.67	0.62
Employer Responsibility	0.24	0.41	0.36	0.35	0.45
Marketable Commodity	0.78	0.55	0.66	0.56	0.56
Professional Service	0.45	0.58	0.58	0.61	0.45

assigned to the correct metaphor than among even the most sophisticated of the general public. But the three processes that were most consistent for the public—treatment responsibility, affective response, and concrete comparisons—were also significantly more consistent for policy elites, with an average Ω of 0.40, compared to 0.25 for the other two cognitive processes. So there is qualified support for hypothesis 3, with metaphorical comparison primarily based on three cognitive processes.

What Metaphorical Reasoning is Not

The data presented so far support the hypothesized cognitive (or grouping) coherence of policy metaphors. But is this simply a relabeling of other more familiar categories of attitudes, belief systems, or ideology? Given the variety of such principles described in the literature (e.g., Kinder and Sears 1985), answering this challenge is potentially an overwhelming task. We limit our efforts to two likely alternatives. We first contrast grouping coherence with attitudinal coherence. Second, we contrast the groupings associated with policy metaphors to those one would expect to find if respondents were grouping statements on the basis of liberalism or conservatism. This latter distinction is particularly important for elite respondents and more sophisticated members of the public, since past research suggests that they are more likely to rely on ideological reasoning.

Attitudinal Coherence. We first conducted a confirmatory factor analysis on the agreement items from the entire set of respondents in order to assess the extent of attitudinal coherence. Statistically, the hypothesized model fit the data reasonably well (a less than 2-to-1 ratio of chi-square to degrees of freedom), although the various fit indices were lower than desirable. Unfortunately, the sample sizes are too small to conduct comparable CFAs for subgroups of respondents. We can obtain roughly analogous assessments, however, by estimating the alpha coefficients for each of the five metaphors separately. These were calculated for both elite and public samples as well as for subgroups of the public, again distinguishing among public

respondents on the basis of sophistication. These results, shown in Table 3, suggest that two metaphors—societal right and marketable commodity—are most coherent for elites, while only community obligation stands out as noticeably more coherent than the others for the general public.

The alpha coefficients highlight differences between attitudinal and grouping coherence. Grouping coherence (Table 1) was generally higher for elites than for the public, but attitudinal coherence is higher among the public for the community obligation, employer responsibility, and professional service metaphors. In other words, elite respondents are more likely to understand metaphors, but the public is more likely to agree or disagree consistently with different aspects of each metaphor. And the measures of attitudinal coherence are less likely to be related to the sophistication of the general public than the measures of cognitive coherence.

These aggregated results illustrate differences in cognitive and attitudinal coherence. We can more thoroughly assess the relationship between these two forms of coherence by using our individualized measures of cognitive coherence Ω (based on the grouping scores) and attitudinal coherence (the variance in agreement with the five statements associated with each metaphor). To what extent are the two forms of coherence correlated at the individual level? Since high values of Ω represent more grouping coherence, but high variance scores represent lower attitudinal coherence, if the two are related we should expect negative associations. The simple Pearson correlation between our measures of cognitive and attitudinal coherence are shown in the first column of Table 4. All the correlations are small for both elite and general public respondents, and none is significantly distinguishable from zero. Attitudinal coherence and grouping coherence are quite distinct.

Ideology. To what extent is grouping coherence determined by ideology? We have no reason to believe that liberals or conservatives would be more likely to think in terms of metaphors in general, but several of the individual policy metaphors do sound as if they could be ideologically loaded (societal rights potentially appealing to liberals, marketable commodity to conservatives). We want to make sure that their coherence is

These data are available from the APSR web site and from the authors upon request.

not due entirely to the groupings of conventional ideologues.

As a first cut, Table 4 shows the zero-order correlations between our individual measures of grouping coherence of each metaphor and a simple seven-point measure of ideological self-identification in the second column, and the extremity of ideological identification (the same seven-point scale, "folded" at its midpoint) in the third. Most of these correlations are indistinguishable from zero, and the only pattern in the data is a tendency for strength of ideological identification to be related to grouping coherence among elite respondents. These correlations are modest at best, and only one—the coherence of the marketable commodity metaphor—is statistically significant. At first glance, then, ideology seems to have little to do with the cognitive coherence of policy metaphors.

To compare metaphorical and ideological bases for grouping, we must identify the statements used in the grouping exercise that are ideologically loaded. We did this by regressing support for each statement on selfreported ideological orientation to identify statements distinctly favored by particular ideological groups (e.g., self-reported liberals, moderates, and conservatives). We then constructed the Hubert-Levin grouping score, in this case using ideology as the map for assessing the respondents' sorting.7 Ideology proved a poor substitute for policy metaphors, at least in terms of thinking about health policy concerns. Among elites, Hubert and Levin's $\Delta = 24.52$ (z = 12.13) for metaphorical grouping, whereas $\Delta = 5.76$ (z = 2.67) for ideological grouping. Among the general public, $\Delta = 20.53$ (z = 10.47) for metaphorical grouping, while $\Delta = 5.34$ (z =1.58) for ideological grouping. This pattern also held for even the most sophisticated subset of public respondents. Thus, the data are much more consistent with metaphorical than ideological reasoning.

-0.12(107)

Support for Metaphors and the Relationship between Support and Coherence

The distinction between attitudinal and grouping coherence presented above offers some indirect evidence relevant to hypothesis 2. If our model of metaphorical reasoning is accurate, then one would expect individuals to be able to reach judgments about whether they support the application of a metaphor to a particular policy domain independent of the extent to which they understand that metaphor as a coherent whole. We can test this relationship more directly using our individuallevel measure Ω of grouping coherence and testing for the correlation between grouping coherence and support measures for the five metaphors.

These correlations are shown in the last column of Table 4. If metaphorical coherence is a function of support for the application of the metaphor, then all these correlations should be positive. They are not; in fact, across the elite and general public samples, six of the ten correlations (and the only statistically significant one) are negative. This provides strong evidence that support for and understanding of policy meta-

^{*}Measured by Ω, the extent to which statements associated with each metaphor were correctly grouped with one another and not with other etatements. See Appendix B for details.

Measured by the variance of respondents' agreement with the five statements making up each metaphor. "We used the standard NES item." We hear a lot of talk these days about liberals and conservatives. Here is a 7-point scale on which the political views that

people might hold are arranged from extremely liberal to extremely conservative. Measured as the absolute value of the deviation from the mid-point of the ideological scale.

[&]quot;Measured by agreement that the metaphor serves as "a good guide to health care reform

⁷ We created three dummy variables for these regressions, for self-identified liberals, moderates, and conservatives (nonideological respondents were the excluded group). A statement was considered ideologically loaded if it was significantly related to one and only one of the three dummy variables. Twelve statements (four for liberals, three for moderates, and five for conservatives) met this criterion. There were, therefore, four expected groups: liberal statements, moderate statements, conservative statements, and those with no apparent ideological loading.

TABLE 5. Overall Leve			Public,	by Level of Sophistication		
	Policy Elites (N = 50)	General Public $(N = 119)$	Hlgh (N = 29)	Medlum (N = 61)	Low (N = 28)

phors represent two distinct cognitive processes, as suggested by hypothesis 2.

reported in the table reflect "strongly agree" and "somewhat agree."

Hypothesis 4 predicts that individuals will recognize desirable features of more than one metaphor for each policy domain. This can be tested with our overall measure of metaphor support. Table 5 shows the percentage of respondents supporting each metaphor (where support is defined as the two most positive responses on the five-point scale). Within each column of Table 5 (i.e., each subgroup) these percentages would sum to no more than 100% if respondents supported only a single metaphor. Clearly, this is not the case. For the entire sample, 78% of respondents agreed with more than one metaphor as a guide to health care reform. Half supported three or more of the metaphors. There were modest differences in this regard between elite and public respondents. Elites were slightly more likely (84%, versus 75% of the general public) to support multiple metaphors, but they were also less likely to favor a large number of metaphors. Thirty-one percent of the public supported four or more of the metaphors; this was true of only 12% of the elite respondents.

Compatibility among Policy Metaphors Applied to Health Care

Hypothesis 5 suggests that there is a broadly shared understanding among the general public and elites about which policy metaphors fit together. Our measures of compatibility among metaphors provide a final test of the comparability of metaphorical reasoning between elites and the public; they also offer the opportunity to assess whether there is a distinctive "logic" to reasoning in metaphorical terms. In both cases, we rely on the scores that respondents assigned for the fit between different pairs of metaphors (5 = completely compatible, 1 = completely incompatible).

The average compatibility scores are reported in Table 6 for both samples, with the public again disaggregated by level of sophistication. Both the public and elites clearly see some metaphors as reasonably compatible (most notably societal rights and community obligation), others as directly conflicting with one another (both societal rights and community obligation metaphors conflicting with marketable commodities). Com-

paring the elite assessments of fit to those of the public as a whole, we find remarkable congruity; the overall correlation between the two sets of ratings is r=.91. Indeed, a multivariate test considering all ten compatibility ratings simultaneously reveals no significant difference between public and elite (F < 1). The only apparent deviation involves the perceived fit of the professional and market metaphors, which are considered more compatible by the public than by elites. These ratings provide strong evidence, albeit indirect, that the metaphors have common meaning to the two groups, as suggested by hypothesis 5.8

When we disaggregate public responses by level of sophistication, we continue to see considerable congruence,9 but also gain some insights into the differences in perceptions of metaphors for the least sophisticated. The overall correlations in compatibility scores between the elite and the public ranged from r = .91 for the most sophisticated public participants to r = .75 for the least. The primary difference lies in the extent to which professional services are seen as compatible with more privatized institutional arrangements. The less sophisticated the respondent, the more compatible professional services are perceived to be with both markets and employer-mediated institutions. We suspect that this pattern emerges because the most sophisticated respondents are more aware of the collective functions performed by most professions, including the generation of knowledge, the development and implementation of standards of training, and so on. Less sophisticated respondents may be more likely to personalize the meaning of professional service into the image of the specific doctor's office or medical group with which they have regular contact.

We suggested earlier that metaphorical reasoning ought to display certain logical properties, such as transitivity. One can test for this by examining the correlations of compatibility ratings for pairwise combinations of metaphors. If metaphorical reasoning is transitive, then ft templates A and B are seen as compatible, and templates B and C are judged to be (m)compatible, then templates A and C also ought to be seen as (in)compatible. This was true for more than 85% of the pairwise comparisons reported by our respondents, which suggests that transitivity holds among metaphors.

^{*} Again, a multivariate test revealed no significant difference in compatibility rating, across the three public groups, F < 1.

TABLE 6. Perceived Compatibility of Metaphors

			Public, by	Level of Sop	histication

Notes: Compatibility reported on a five-point scale ranging from "completely compatible" (5) to "completely incompatible" (1) Multivariate tests comparing all ten compatibility ratings of elites to those of the general public suggest that any differences between the elite and public are probably due to chance. Likewise, there are no reliable differences between the compatibility rating of the three subgroups of the general public. Hence, there are no significant differences within rows across columns of Table 6. Within columns, however, there are some significant differences. Means sharing supersoripts do not differ from each other at the .06 level by the Newman-Kaule post hoc test. For example, in the first column of the table (i.e., the elite sample), the first mean 2.13 is significantly less than every other mean in that column since no other mean in that column shares an "a" supersoript. The next two means in that column (2.64, 3.04) do not differ from each other, as indicated by the sharing of a "b" superscript. The second mean (2.64) does differ significantly from the fourth (3.47) anoe they share no common superscripts. But the third mean (3.04) does not differ significantly from the fourth, as indicated by the sharing of a "o" superscript.

DISCUSSION

In this article we develop a model of reasoning by policy metaphor and apply it to the arena of health care reform. The model identifies several distinct stages in metaphorical reasoning—understanding the metaphor, deciding whether it is appropriate as a guide to policy, and determining whether it is compatible with other favored institutional templates. We hypothesized that five cognitive processes underlay metaphorical reasoning-identifying causal responsibility, assigning treatment responsibility, applying norms of fairness, evoking affective responses, and establishing concrete comparisons-although our results suggest that policy metaphors are dominated by the second, fourth, and fifth of these processes. The data provide evidence that (1) policy metaphors are coherent to both policy elites and members of the general public; (2) understanding particular metaphors appears to be distinct from favoring that metaphor as a guide for policymaking; and (3) there are shared patterns in metaphorical thinking between elites and the general public, as reflected in the relative coherence of different metaphors, the cognitive processes that are most salient for metaphorical reasoning, and the extent to which pairs of metaphors are seen as compatible with one another. Both understanding of individual metaphors and assessments of compatibility among metaphors are largely distinct from a respondent's support for that metaphor in a particular policy domain. This study also offers strong evidence that policy metaphors are distinct from political ideology.

It is, of course, important to interpret these findings in light of some of the methodological limitations of this study. First, we focused on a single policy domain. The

extent to which the particular metaphors identified here or the general model of metaphorical thinking can be applied to other policy areas is not clear. ¹⁰ In particular, the salience of health care reform in 1993–95 may have made less sophisticated public respondents more aware of prevailing templates and thus more capable of metaphorical reasoning. Yet, we have no reason to expect that health care is so unique that health policy issues would be thought about in ways entirely different from other forms of domestic policy.

Second, we cannot determine through the techniques used here whether metaphorical reasoning is used spontaneously by decision makers or was in part stimulated by our experimental methods. For several reasons, we do not believe that the findings can be dismissed as an artifact of our testing procedure. First, there is considerable evidence in the literature of the spontaneous use of metaphorical reasoning about policy (Annas 1995; Lakoff 1996; Rein and Schön 1994; Shimko 1994). Although largely drawn from episodes involving policy elites, these situations often involve elites trying to communicate issues to the public by using metaphors to make issues more comprehensible. Second, we do not think that our primary methods artificially induced patterns of metaphor coherence.

¹⁰ Lau and Schlesinger (1997) explore the relevance of the five metaphors identified here to four additional policy domains: long-term care, the treatment of substance abuse, programs for the homeless, and public education. The metaphors are shown to predict policy positions (above and beyond the traditional measures of political ideology, party identification, political values, and so on) toward medical care as well as government actions in these four other policy areas.

Although we did frame metaphors in terms of the particular statements, the grouping exercise from which we constructed our measures of cognitive coherence represents a relatively unobtrusive method of assessing thinking. Indeed, we believe that the process was somewhat biased against grouping by metaphor. There would likely have been a natural tendency for respondents to group statements by the extent to which they agreed with them (despite instructions to the contrary) or their commonality in terms of the cognitive processes (e.g., assigning treatment responsibility) that they invoked. Finally, one would not expect whatever mild cues were created by our methods to have any substantial influence on the responses from policy elites, whose experience gives them well-defined ideas about health policy. Yet, this was the group for which the cognitive coherence of policy metaphors was stron-

The use of policy metaphors in political judgments offers the first explanation of the paradox of public opinion we posed at the outset. Members of the public can reach reasoned (and reasonable) assessments of policy even if largely ignorant of the details of policy or the workings of American politics. They can do so because policy metaphors involve comparisons to familiar social institutions and are thus largely independent of the political context. But the evidence from the policy elites in the study suggests that even for those who have a clear understanding of the political factors affecting health policy, the metaphors identified here are meaningful constructs.

Metaphorical reasoning calls for an approach to assessing public opinion somewhat different from those conventionally employed. Measures of political knowledge become less relevant; exposure to and assessment of various social institutions more relevant. Support for policies is less likely to be shaped by conventional understandings of ideology, self-interest, or sociotropic considerations and more likely to be influenced by the policy metaphors that are evoked by particular social issues or policy proposals. Needless to say, this requires a rather different set of questions on public opinion surveys.

If our findings can be generalized, they may shed some light on the political dynamics of responses to complex social problems. Coalition formation may require appealing to supporters of several different metaphors. Our findings suggest that not all conceivable combinations of metaphors will make sense. Some are seen as fundamentally incompatible with others. Policies that try to bridge these gaps will thus appear incoherent to the public, however much sense they make from a more technical or political perspective. We predict that the resulting loss of legitimacy would make such policies hard to enact, and we note in passing that President Clinton's failed health care reforms tried to wed two metaphors that our respondents perceived to be the most incompatible—societal rights and marketable commodity.

Metaphors also address the problems of communication between policy elites and the general public. Efforts to improve democratic participation have been hampered by their exclusive focus on the rules or protocols for deliberation. They offer no help with challenges of effectively discussing complex societal problems. To invoke a linguistic metaphor of our own, past approaches emphasize a grammar of deliberation but fail to provide any vocabulary. We believe that policy metaphors represent one potentially useful vocabulary. By melding this approach with protocols for effective deliberation, we believe that the language of policy debate can be substantially enhanced.

In describing the heuristic properties of policy metaphors, we have emphasized positive attributes of metaphorical reasoning, but psychologists have shown that virtually all decision-making heuristics can bias or otherwise distort decision making (Kahneman, Slovic, and Tversky 1982; Nisbett and Ross 1980). As discussed above, these sorts of biases have been extensively documented for the use of analogies in various policymaking contexts (e.g., "top-down" processing, "availability" biases; see Khong 1992 or Neustadt and May 1986). Metaphorical reasoning appears less vulnerable to these particular biases, but it may have other liabilities. Because metaphors must be grounded in concrete experience to be effectively interpreted, they may be viewed in quite varied ways by different decision makers. Americans' understanding of "community," for example, varies considerably, both geographically and over time (Fowler 1991). Consequently, its application to American health policy tends to be deeply contested (Light 1997; Schlesinger 1997).

Despite the limitations inherent in metaphorical reasoning, more explicit reliance on metaphorical alignment may have the potential to improve democratic deliberation. Because this has not yet been demonstrated empirically, our prescriptions must be viewed as speculative. Clearly, the next step would be to establish the relevance of policy metaphors to a broader set of social policy concerns. There also is considerable potential in experiments that would attempt to establish a common language for policy deliberation that is based on a shared understanding of policy metaphors. If the findings presented here are generalizable, such a dialogue ought to prove accessible to both elites and the general public. This certainly would represent an improvement over the state of much contemporary political debate on complex policy matters.

APPENDIX A: DESCRIPTIVE STATEMENTS CAPTURING METAPHORICAL REASONING

The 25 metaphorically oriented statements provided to respondents for grouping are listed below. One statement represents each of the five hypothesized cognitive processes for each of the five hypothesized policy metaphors. Each statement was presented to subjects on a separate note card.

TABLE
9
ř

	0 I	,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,			
Statement Applied to a			Cognitive Process		
Particular Policy Metaphor	Diagnosts of Problem (Causal Responsibility)	Treatment Responsibility	Personal Familiarty (Comfort)	Norms of Equity	Concrete Compartson
Societal Right	A big problem with the health care system is that your health care depends on what your health plan allows, what you earn, and where you live.	You need national solutions to address skyrocketing health care costs and the millions of people without any health insurance.	You can trust federal programs to be fair and responsive to public needs.	The most important aspect of a just health care system is that everyone be treated equally.	The health care system would work better if it was run more like the Social Security system.
Community Obligation	The biggest problem with the health care system today is that hospitals and physicians are no longer committed to meeting the needs of the cities and towns where they provide health care.	We should seek solutions to health care problems from local government or community-based groups because each community has different health needs.	People who live in the same area know each other's health problems and share beliefs about how to solve them.	A fair health care system is one in which people go to the same hospitals and doctors as do other people whom they know and with whom they share common values.	The health care system would work better if it were run locally, like elementary and secondary education.
Employer Responsibility	The most important falling of the health care system is that you can't count on getting health benefits when you get a job or keeping decent benefits from one year to the next.	The best way to find a good solution to the challenges of health care reform is to let workers and managers bargain with one another to decide on health benefits.	People who work together share a lot of the same needs and concerns; they would be comfortable sharing the same health insurance, doctors, and hospitals.	People who are most productive should make the most income and be offered the best fringe benefits.	The health care system would work much better if retired workers could get health care benefits from their former employer, just like they get other retirement benefits.
Marketable Commodity	Our health care system is struggling because people don't think about purchasing health care wisely.	In the end, each person ought to make the choices that determine how much health care he or she will pay for and receive.	Most people are comfortable choosing a good health care provider and can tell when they're getting a good value for their health dollar.	The health care system would be most fair if it allowed individuals to decide about the health insurance and health care that best matched what they want to pay for.	The health care system would be more effective if people looked for a doctor in the same way they look for a good auto mechanic.
Professional Service	A major problem with American medicine is that doctors no longer place the patient's well-being above concerns about health care costs.	The best solutions to our country's health care crists will be found by physicians and others who provide health services.	Most people trust their physician with their health care problems and would be comfortable having physicians guide policymakers in reforming the health care system.	People should get health care based on needs, as determined by medical experts, regardless of costs.	The health care system would work better if doctors had full control over the system in the same way that judges run courtrooms.

APPENDIX B: AN INDIVIDUAL-DIFFERENCE MEASURE OF GROUPING COHERENCE

The overall coherence score Ω is given by $\Sigma_{\iota}\Sigma_{\iota}[h_{\iota\iota}]$ $(N_i-1)-m_{ij}/(N_i-N_i)/J$, where for every statement j in metaphor I the h ("hits") refers to the number of other statements from the metaphor that were correctly grouped with the statement in question; the m ("misses") represents the number of other statements that did not belong in the metaphor that were grouped with the statement in question; N_i , is the number of items hypothesized to belong in group j; J is the number of distinct groups in the entire set of statements; and N_i represents the total number of statements in the grouping exercise. Translated into English, the measure represents for any individual subject the average proportion of items (across all items theoretically in the group) that were correctly placed in their hypothesized group, minus the average proportion of incorrect items that were placed in the group. Correspondingly, one can calculate a grouping score specific to each metaphor (summed across the five cognitive processes) using the formula presented above, except not dividing the difference of proportions by the number of groups J.

The statistical properties of our individualized grouping measures are somewhat complex. If respondents group statements in extreme ways (e.g., put all statements into one pile, or divide all statements into individual piles), the measure yields a score of 0. A grouping perfectly consistent with our hypothesized metaphors yields a score of 1.0. If respondents were to group by placing together all statements from a given cognitive process, rather than a given metaphor, they would obtain a score of -.2.

Although the measure Ω seems a plausible way of scoring grouping compatibility at the individual level, it is important to validate its correlation with the Hubert-Levin Δ . To assess this relationship, we divided our sample into four groups: elites and three subsets of the public, based on the public's reported level of sophistication about health care reform (as described in the text). For each of the four subsamples, we calculated both a Δ and a mean Ω (averaged across the respondents in the subsample) for each of the five metaphors. This provided us with twenty scores for each measure (five metaphors times four subgroups). The correlation coefficient between the two measures calculated across these 20 scores was r=.975, which leads us to conclude that the two are measuring essentially the same reasoning process: Δ at the aggregate level, Ω at the individual level.

Cabinet Terminations and Critical Events

DANIEL DIERMEIER Northwestern University RANDOLPH T. STEVENSON Rice University

e present an empirical assessment of Lupia and Strøm's noncooperative bargaining model of cabinet terminations. We construct a stochastic version of the model and derive several testable implications. As the next mandatory election approaches: (1) the probability of an early election increases; (2) a cabinet's risks of being replaced without an intermediate election may be flat or even decrease; and (3) the overall chance that a cabinet falls (for whatever reason) increases. Using nonparametric duration analysis on a 15-country data set, we find qualified support for the Lupia and Strøm model. We conclude that the strategic approach is more promising than the nonstrategic alternative, but a more fully dynamic strategic model will be required to account for the dynamics of cabinet stability.

Gleiber's path-breaking work (1984, 1986), the concept of a "critical event," that is, an exogenous random shock that destabilizes an existing government, has been a central part of research on cabinet termination. The original work by Browne and his colleagues attempted to characterize the distribution of cabinet durations by relying solely on assumptions about how critical events are realized over time. Following Strøm (1983), King et al. (1990) and Warwick (1992, 1994) expanded the usefulness of that approach by studying how covariates affect cabinet duration by altering the distribution of failures implied by the critical events approach.

Lupia and Strøm (1995) recently presented a gametheoretic model of cabinet termination that sheds new light on the role of critical events in cabinet survival. Their key insight is to recognize that—contrary to Browne, Fendreis, and Gleiber—not all shocks will become critical events and destabilize the government. Rather than determine directly whether cabinets survive, the events are interpreted as inputs into a coalition bargaining process. They correspond to bargaining parameters that determine each party's outside option if the government falls. Whether a cabinet terminates depends on the attractiveness of this outside option compared to each party's payoff from the current government.

This interpretation of the effect of random events marks a potentially important shift in the study of cabinet termination. In particular, the specification of explicit models of interparty bargaining is likely to focus attention on the role of institutional features of the bargaining environment in determining cabinet failure rather than on a list of cabinet attributes (such as the number of formation attempts) or general measures of the political environment (such as the number of parties represented in parliament), which have been emphasized in the empirical literature (King

et al. 1990; Strøm 1985; Warwick 1994). For example, it may be more important to ask which actors have the power to dissolve the legislature and whether these differences have any consequences for the stability of cabinets. Due to the potential methodological and substantive implications of the bargaining approach, it is important to assess its empirical usefulness in comparison to alternatives, but some challenges arise in formulating and conducting such an assessment.

The first challenge is that the Lupia-Strøm framework (like most game-theoretic models) is deterministic, whereas the phenomenon (cabinet termination) is probabilistic. We solve this problem by embedding the Lupia-Strøm model in the stochastic environment used by Browne, Fendreis, and Gleiber. We can then derive theorems about the probability of cabinet survival from the model, interpret them as alternative hypotheses, formulate the (nonstrategic) Browne, Fendreis, and Gleiber model as the null hypothesis, and use classical hypothesis testing to assess whether the Lupia and Strøm strategic model significantly improves upon the nonstrategic approach.

The second challenge is that the model is intended to explain an empirical regularity, but on close inspection the claimed regularity is not an implication of the model. At issue is Warwick's (1992) finding of increasing hazard rates, that is, the conditional probability of a termination in the next period given the cabinet has survived thus far. In other words, the longer a government is in power, the more likely it is to terminate. As we discuss below, even the stochastic version of the Lupia-Strøm model does not imply Warwick's finding of increasing hazard rates, but it does imply a closely related empirical regularity. The difference is that Warwick's result refers to increasing hazard rates in elapsed time, whereas the stochastic version of the Lupia-Strøm model implies increasing hazard rates in the time remaining until the next regularly scheduled election. That is, the less time left until an election must be called, the more likely it is that the government terminates. This conceptual subtlety has important practical consequences, since we cannot use standard estimation techniques, designed for hazard rates in elapsed time, to test the implications of the model.

In addition to clarifying the empirical implications of the Lupia and Strøm model, our stochastic reconstruc-

Daniel Diermeier is Professor of Managerial Economics and Decision Sciences, Northwestern University, Evanston, IL 60208-2009. Randolph Stevenson is Assistant Professor of Political Science, Rice University, Houston, TX 77005-1827.

tion has important empirical implications that are new to the literature. In the Lupia and Strøm model each round of bargaining results in one of three possible outcomes: the status quo government persists, the chamber is dissolved and early elections are held (a dissolution), or the incumbent cabinet is immediately followed by a new one (a replacement). This distinction allows us to study not only cabinet termination but also the mode of termination. As Lupia and Strøm show, the factors that determine cabinet survival (irrespective of the termination mode) are in general different from those that dictate whether cabinets end in dissolution or replacement. Our stochastic version of their model takes this intuition farther: We demonstrate that dissolution hazards increase, but replacement hazards may be flat or even decrease. A further implication is that dissolution hazards may increase at a steeper rate than pooled hazards.

We use data on postwar cabinets to test these implications. The practical consequence of our theoretical analysis is that we cannot rely on the standard estimation techniques of duration analysis used in previous studies, which are all defined in terms of elapsed time and involve only one termination mode. Another implication is that we need to take a nonparametric approach because we make no assumption about the distribution of events themselves, only the rate at which they occur.

THE LUPIA/STRØM MODEL

Lupia and Strøm propose a framework in which three parties bargain over whether to replace the current cabinet, continue with it, or call new elections. Bargaining occurs in an environment of perfect information, and collective decisions are taken by majority rule.

Formally, each party $i \in \{0, 1, 2\}$ has a fixed share of seats, s_i . The game presupposes an initial governing coalition composed of two parties (1 and 2). The third party (0) forms the opposition. If party i and i' form a coalition, its value to party i is denoted g_i' . Hence, parties may value some potential coalition partners more than others. The distribution of the value associated with a governing coalition is indicated by parameter c, which indicates party 1's share. Party 2's share then equals 1 - c. Parties receive payoffs $u_i(\cdot)$ as a function of their respective seat share, the value of the governing coalition, and the share of power. In particular, we have for party $1, u_1(s, c, g_1^2) = s_1 + c \cdot g_1^2$; for party $2, u_2(s, c, g_2^1) = s_2 + (1 - c) \cdot g_2^1$; and for party $0, u_0(s, c, g_2^2) = u_0(s, c, g_1^2) = s_0$.

In addition to the payoffs associated with potential governing coalitions, bargaining depends on two exogenously given parameters for each party i: the benefits b_i and costs E_i of an "event." Events are interpreted as common knowledge information about what would happen if parliament were dissolved and an election were held immediately. Parameters b_i and E_i function as outside options in the bargaining process. It will be sufficient to consider the net benefits from holding elections, defined as $e_i := b_i - E_i$.

Coalitional bargaining proceeds as follows. Condi-

tional on observing an event and a governing coalition $\{1, 2\}$, the members of the governing coalition may make offers to the opposition party 0 or to their coalition partner. Party 1 makes the first offer. If it is accepted we have a new coalition, and the players incur a negotiation-related transaction cost, k_i . This coalition may consist of the previous members (but possibly with a new distribution of power) or may be composed of new members. If all offers are rejected, the chamber decides by majority rule on whether to dissolve and hold subsequent elections. If the motion to dissolve fails, the status quo prevails.

Using subgame perfect Nash equilibria, Lupia and Strøm give necessary and sufficient conditions for each of these outcomes and discuss some comparative statics implications of their model. Most of these implications, however, refer to changes in transaction costs that are notoriously hard to measure. In the discussion of their formal results, they also suggest that their model implies Warwick's (1992) finding of increasing hazard rates. Their argument proceeds as follows. At the beginning of every period a government has some expected life-span which is always less than the time to the next regularly scheduled election. During its time in office the government receives a per-period payoff from policy outcomes or from collecting distributive benefits. Consequently, at the very beginning of its term, the total benefit a government can expect to collect over the life of the cabinet is large, and an early election will seldom look promising. Early dissolutions will only occur if the expected electoral benefits are very high, an unlikely event. Yet, because governments must call elections at constitutionally mandated intervals, the expected benefits from staying in office will decrease over time. Thus, as a parliament approaches the end of its constitutional interelection period (CIEP), smaller and smaller events (i.e., smaller expected electoral benefits) will be sufficient for a dissolution. This, according to Lupia and Strøm (1995, 656, n. 24), implies increasing hazard rates.

There are at least two problems with Lupia and Strøm's assertion. First, the argument applies only to dissolutions, whereas Warwick's analysis does not differentiate among different termination types. To see why his finding is logically independent from Lupia and Strøm's argument, consider the opposite case, in which the hazard rate for dissolution decreases, while the hazard rate for replacement increases at a higher rate. In this case, Warwick's analysis nevertheless indicates an increasing pooled hazard rate. Thus, a finding of increasing pooled hazard rates alone does not confirm the Lupia and Strøm model. Second, the predicted change in hazard rates from period to period does not apply to elapsed time (as is the case in Warwick's analysis) but to time remaining until the end of the CIEP.

MODELING CRITICAL EVENTS

To address these problems, we present a probabilistic version of the Lupia and Strøm model. It differs from the original in three respects. First, we make explicit the assumptions implicit in Lupia and Strøm's model. Second, we specify a stochastic process that governs the occurrence of events. Third, we make a few symmetry and boundary assumptions that simplify notation and computation.

Assumption 1 formalizes the idea that an event consists of shifts in electoral prospects, not shifts in the current distribution of seats or transaction costs. Furthermore, the share of power, c_i , is assumed to be constant, since a change in coalition shares, by definition, would imply a different governing coalition. To save on unnecessary notation and case distinctions, we assume that negotiation costs are the same for all parties and not "too high."

Assumption 1. For all players, s_v c_i , and k_i are constant, with $k_1 = k_2 =: k$ and $s_1 > k$, $s_2 > k$.

Assumption 2 refers to the dynamics of office benefits. This is a critical component if the model is to imply increasing hazard rates. Specifically, we allow each g_t^t to vary over time and write $g_t^t(\tau)$, where τ denotes the time left until an election must be called, with $T \ge \tau \ge 0.1$ T thus denotes the CIEP, the maximally permissible time between two elections. Similarly, we write $u_t(\tau)(s_t, c, g_t^{t'}(\tau))$.

In the Lupia and Strøm model the size of the pie to be distributed varies depending on who is in the coalition. Since the distribution is already captured by c (and any other differences in utility by s_i), we simply write $g_{\{l,l'\}}(\tau) := g_l'(\tau) = g_l'(\tau)$. We then have the following assumption on how the benefits from governing change over time.

Assumption 2. For all parties i, i' and
$$\tau' < \tau$$
: $g_{\{i,i'\}}(\tau) - g_{\{i,i'\}}(\tau') = d(\tau, \tau') > 0$.

Assumption 2 says that as the end of the CIEP approaches, the overall value of the coalition to the parties in government will decline. The next assumption specifies the stochastic process that governs the occurrence of events.

Assumption 3. An electoral prospect is a three-dimensional continuous random variable $\tilde{e}:=(\tilde{e}_0,\,\tilde{e}_1,\,\tilde{e}_2)$ drawn from a distribution $H_{\tilde{e}}(e)$ with $h_{\tilde{e}}(e_0,\,e_1,\,e_2)>0$ almost surely, such that

$$E:=\sum_{i}e_{i}>\sum_{i}s_{i}+\sum_{i\neq i}g_{\{i,i'\}}(T), \text{ with } E<\infty.$$

Electoral prospects occur according to a Poisson process with arrival rate δ .

These assumptions capture the stochastic environment proposed by Browne, Frendeis, and Gleiber, and thus formally embed Lupia and Strøm's model in this framework. The second part of Assumption 3 captures the idea that events are about electoral prospects and, consequently, future office benefits. If electoral competition corresponds to a constant sum game (as most of the formal literature assumes), then an event is an element from a simplex whose size depends on the

magnitude of future office benefits. We assume that this sum is large enough to avoid unnecessary case distinctions.²

Our last assumption concerns the status of the initial cabinet (i.e., before the first event occurs).

Assumption 4. The initial governing coalition constitutes a Nash equilibrium. That is, $cg_1^2(T) \ge g_1^0(T) - k_1$ and $(1-c)g_2^0(T) \ge g_2^0(T) - k_2$.

Assumption 4 follows if we assume that the initial cabinet constitutes a Nash equilibrium of some (unmodeled) cabinet formation game. For our purposes, this means that in the absence of an event in the first period, each member of the governing coalition in place weakly prefers the current coalition to any other feasible coalition.

Lupia and Strøm identify necessary and sufficient conditions, denoted A-C, for a potentially critical event to lead to dissolution or replacement. Using our modified model we can rewrite these conditions as:

(A)
$$\exists S \subseteq \{1, 2, 0\}: \sum_{i \in S} s_i > 0.5 \text{ and } \forall i \in S: e_i$$

$$> u_{\iota}(\tau)(s_{\iota}, c, g_{\{1,2\}}(\tau))$$

(B)
$$\forall i \in \{1, 2\} : e_i > \max_{j \neq i} [s_i + s_j + g_{\{i,j\}}(\tau) - e_j - k]$$

(C)
$$\forall \tau : cg_{\{1,2\}}(\tau) \ge g_{\{0,1\}}(\tau) - k$$
 and
$$(1-c)g_{\{1,2\}}(\tau) \ge g_{\{0,2\}}(\tau) - k$$

Intuitively, condition A states that there is some decisive coalition that prefers an election over the current government. Condition B states that both members of the governing coalition prefer an election over the best offer they can receive in the bargaining process.³

Note that assumption 4 implies that condition C holds for $\tau = T$. But by assumption 2, condition C must also be true for all τ . Hence, condition C plays no role in the characterization of dissolutions and replacements. Therefore, the characterization of the possible outcomes of the bargaining process can easily be summarized as follows.

- A is TRUE and B is TRUE ⇒ Dissolution.
- A is TRUE and B is FALSE ⇒ Replacement.
- A is FALSE and B is TRUE ⇒ Status Quo.
- A is FALSE and B is FALSE ⇒ Status Quo.

Whether termination occurs depends only on condition A. This allows us to draw conclusions about the hazard rate of pooled cabinet terminations independent of the specific type of termination. Given Lupia and Strøm's assumed utility function, $e_i > u_i(\tau)(s_i, c, g_{\{1,2\}}(\tau))$ corresponds to one of the following inequalities:

¹ Note that we count time "backward."

² Assumption 3 does not preclude the possibility that a party expects to form a single-party majority government. In the Lupia and Strøm framework no party has a majority, so their model would not apply to that (new) single-party government.

³ Given subgame perfection, the ε-bound used by Lupia and Strøm in condition C is not necessary.

⁴ This formulation suggests how the Lupia and Strøm result could be generalized to more than three parties. For condition A to be true,

(i)
$$e_1 > s_1 + c \cdot g_{\{1,2\}}(\tau)$$
, (ii) $e_2 > s_2 + (1 - c)$
 $\cdot g_{\{1,2\}}(\tau)$, and (iii) $e_0 > s_0$.

Which inequality must be true in order to satisfy condition A depends on the set of decisive coalitions implied by the seat distribution. In the Lupia and Strøm model, any decisive coalition must have at least two members. That is, for condition A to hold, at least two of the inequalities must be true. Since this is also sufficient for a termination, we can without loss of generality focus on the coalitions with exactly two members.

Let $\lambda \epsilon(\tau)$ denote the probability that an incumbent government terminates in the small interval $(\tau, \tau + \epsilon)$. That is,

$$\lambda \varepsilon(\tau) := \Pr(\tau < \tilde{\tau} \le \tau + \varepsilon | \tilde{\tau} \ge \tau).$$

By assumption 3 this probability can be expressed as the product of two terms. The first is simply the probability that an event will occur in an ε interval. Given our Poisson assumption, this probability equals $\varepsilon \delta + o(\varepsilon)$, where $o(\varepsilon)$ is the probability of receiving more than one offer in a small time interval, with $\lim_{\varepsilon \to 0} o(\varepsilon)/\varepsilon = 0$. The second is the probability that condition A is true, that is, the probability that ε satisfies at least two of the inequalities. Intuitively, this captures the probability that an event leads to a cabinet termination. We denote this probability by $\pi(s, c, g_{\{\iota, \iota'\}}(\tau))$. We then have

$$\lambda \varepsilon(\tau) = (\varepsilon \delta + o(\varepsilon)) \cdot \pi(s, c, g_{(s, r)}(\tau)).$$

Using this formula we can easily identify the similarities and differences between the nonstrategic model of Browne, Fendreis, and Gleiber and the bargaining model proposed by Lupia and Strøm. In both cases events occur with the same probability and are drawn from the same distribution. The key difference lies in the probability with which an event becomes critical. In the Browne, Frendreis, and Gleiber approach, $\pi(s, c, g_{\{l,i'\}}(\tau))$ simply is a constant. That is, each event leads to a termination with a certain fixed probability. In the Lupia and Strøm model, $\pi(s, c, g_{\{l,i'\}}(\tau))$ may in general change over time.

To derive testable implications for the Lupia and Strøm model, we need to derive instantaneous termination probabilities or hazard rates. For pooled terminations we have

$$\lambda(\tau) := \lim_{\varepsilon \to 0} \frac{(\varepsilon \delta + o(\varepsilon)) \cdot \pi(s, c, g_{(\omega)}(\tau))}{\varepsilon}$$
$$= \delta \pi(s, c, g_{(\omega)}(\tau)).$$

The behavior of the hazard rate thus depends on the behavior of $\pi(s, c, g_{\{i,i'\}}(\tau))$. We can show that $\pi(s, c, g_{\{i,i'\}}(\tau))$ is strictly monotonically increasing for de-

creasing τ , which leads immediately to the following proposition.

Proposition 1. Hazard rates for pooled terminations are strictly monotonically increasing as the time left until the next regularly scheduled election decreases.⁵

The Lupia and Strøm model thus has implications that are qualitatively different from the nonstrategic approach of Browne, Frendreis, and Gleiber. According to the latter, we expect constant hazard rates. According to the former, hazard rates will increase as the next mandated election approaches.

It is worthwhile to point out that proposition 1 holds for any constant distribution of events $H_s(e)$ with $h_s(e)$ > 0 almost surely. Since events are interpreted as electoral expectations, any assumption about the distribution of events would translate into substantive assumptions about the nature of electoral competition in multiparty democracies. For example, in a model of elections in which incumbents loose support over time, one would need to specify a series of functional forms for $H_{\mathfrak{g}}(e)$ (with an appropriate time subscript) in which the probability of a good draw for an incumbent is monotonically decreasing. In other words, the model points out that any parametric or semiparametric specification of cabinet duration implicitly presupposes a particular model of electoral competition in multiparty democracies. Proposition 1, however, holds for any such model.

The intuition for proposition 1 is conveyed in Figure 1. Given assumption 3, the event space constitutes a two-dimensional simplex, the equilateral triangle in Figure 1. Each point corresponds to a realization of the electoral prospects of the two governing parties, e_1 and e_2 . Note that condition A imposes a set of linear constraints on this sample space. If an event in the dotted region occurs, condition A is satisfied, and the cabinet terminates. Otherwise, the status quo persists.

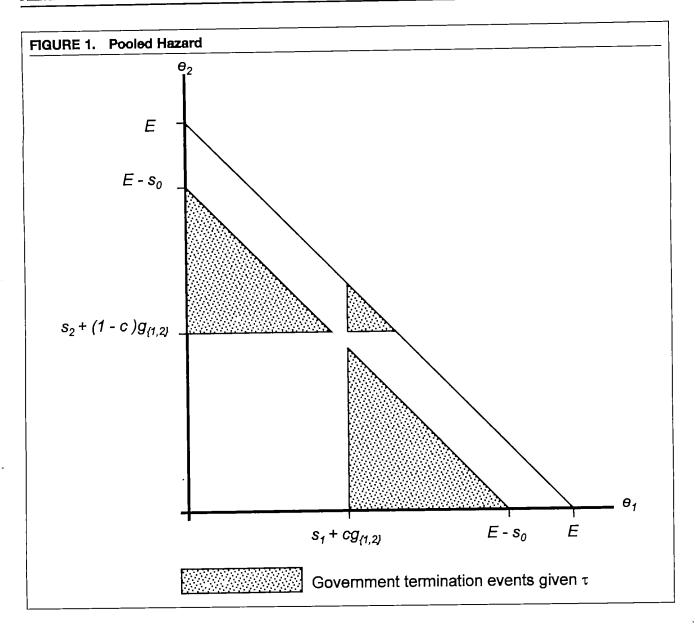

As the elapsed time until the next regularly scheduled election decreases, however, the horizontal line at $s_2 + (1-c)g_{\{1,2\}}$ drops, and the vertical line $s_1 + cg_{\{1,2\}}$ moves to the left, as shown in Figure 2. The new sample space (indicated by the gray area) thus includes the old (dotted) sample space. Hence, governments are more likely to terminate as the time until the next regularly scheduled election decreases. This result holds for any distribution of events.

CALLING ELECTIONS VERSUS REPLACING THE CABINET

The bargaining approach has implications for the probability that a dissolution or a replacement will occur. That is, we can draw inferences about termination-specific hazard rates. The random variable that a government terminates at time $\tilde{\tau}$ by dissolving the chamber and calling a new election is denoted by $\tilde{\tau}_d$, and the random variable that the government terminates and at this time is replaced by a new one, without

a decisive coalition must prefer the outside option. This is critical in making sure that the threat to call early elections is credible. Note that in the three-party model every coalition is decisive. This simplifies the analysis.

 $^{^{5}\,\}mathrm{All}$ proofs are omitted due to space limitations and are available from the authors.

an election, is denoted by $\tilde{\tau}_r$, with j=d, r. Note that the realized duration of a cabinet corresponds to $\tau=\min_{r} \{\tau_d, \tau_r\}$.

Let $\lambda_j \varepsilon(\tau)$ denote the probability that an incumbent government ends according to termination mode j in the small interval $(\tau, \tau + \varepsilon)$. That is,

$$\lambda_{j}\epsilon(\tau):=\text{Pr}(\tau<\tilde{\tau}\leq\tau+\epsilon\ \&\ \tilde{\tau}=\min_{j}\ \{\tilde{\tau}_{\textit{d}},\ \tilde{\tau}_{\textit{r}}\}\big|\tilde{\tau}\geq\tau).$$

We can then derive termination-specific probabilities. We denote the probability that both condition A and condition B are true (and the cabinet terminates in a dissolution) by $\pi_d(s, c, k, g_{\{i,i'\}}(\tau))$; the probability that condition A is true but not condition B (which corresponds to a replacement) is denoted by $\pi_r(s, c, k, g_{\{i,i'\}}(\tau))$. Then,

$$\lambda_{r} \varepsilon(\tau) = (\varepsilon \delta + o(\varepsilon)) \cdot \pi_{r}(s, c, k, g_{(r,r')}(\tau)).$$

Finally, we can derive risk-specific hazard rates as

$$\lambda_{j}(\tau) := \lim_{\varepsilon \to 0} \frac{(\varepsilon \delta + o(\varepsilon)) \cdot \pi_{j}(s, c, k, g_{\{\xi, t'\}}(\tau))}{\varepsilon}$$
$$= \delta \pi_{j}(s, c, k, g_{\{\xi, t'\}}(\tau)).$$

Note that $\pi(s, c, g_{\{l,l'\}}(\tau)) = \pi_r(s, c, k, g_{\{l,l'\}}(\tau)) + \pi_d(s, c, k, g_{\{l,l'\}}(\tau))$ and $\lambda(\tau) = \lambda_r(\tau) + \lambda_d(\tau)$. That is, termination-specific hazards are conditionally independent.

The Browne, Frendreis, and Gleiber model predicts no qualitative difference among termination modes. Moreover, the termination-specific hazard rates will be constant. This is not true in the Lupia and Strøm model, as indicated by the following proposition.

PROPOSITION 2. Hazard rates for dissolutions are strictly monotonically increasing as the time left until the next regularly scheduled election decreases.

 $^{^6}$ It is obvious from condition B that the termination-specific probabilities depend also on k.

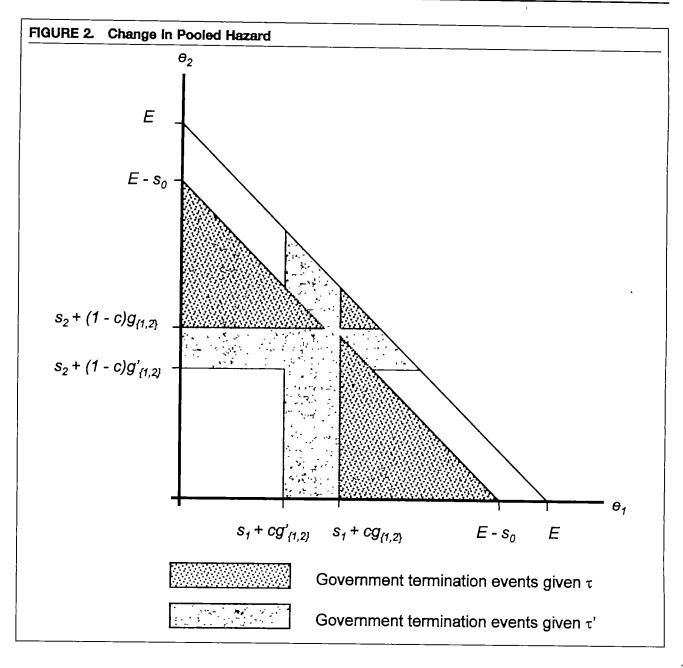

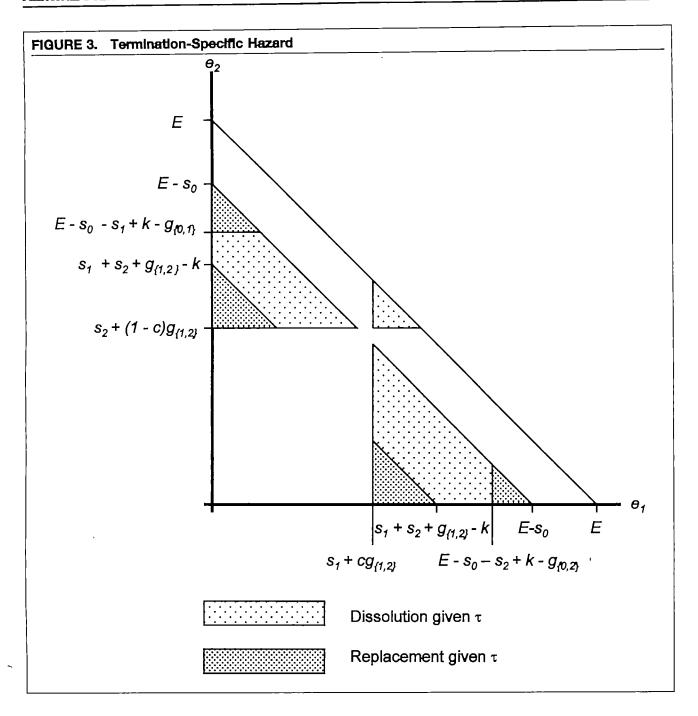

Figure 3 provides the intuition for the argument. The linear constraints associated with condition B now divide the termination region into two subregions. An event located in the lightly dotted region corresponds to a dissolution. An event located in the densely dotted region leads to a replacement. Otherwise, the status quo prevails. As in the discussion of proposition 1, the key to proposition 2 is the movement of the linear constraints.

As shown in Figure 4, five lines move simultaneously as τ becomes smaller. The two lines at $s_2 + (1 - c)g_{\{1,2\}}$ and $s_1 + cg_{\{1,2\}}$ move as in proposition 1. The upper horizontal line moves up, the line on the extreme right moves to the right, and the diagonal line moves toward the origin. Hence, as in proposition 1, the new sample space (indicated by gray) includes the old sample space leading to increasing hazard rates. In other words, there are no white (lightly) dotted regions.

Can we draw similar conclusions about replacement hazards? The answer is "no." From Figure 5 we can see that, in contrast to propositions 1 and 2, the sample space at $\tau' < \tau$ is not a subspace of the event space at τ . Hence, the shape of the replacement-specific hazard depends in general on the distribution of events, $H_{\delta}(e)$. Without an assumption about $H_{\delta}(e)$, we cannot predict the shape of replacement hazards.

There is an important implication for the comparison with the Browne, Frendreis, and Gleiber model. According to that approach, termination-specific hazard rates will not be qualitatively different. Indeed, they will be constant, although not necessarily at the same rate. This is not true in the Lupia and Strøm model, which predicts increasing hazard rates for dissolution (proposition 2) but replacement hazard rates of any shape, depending on the functional form of $H_{\delta}(e)$. An empirical finding of qualitatively different hazard rates

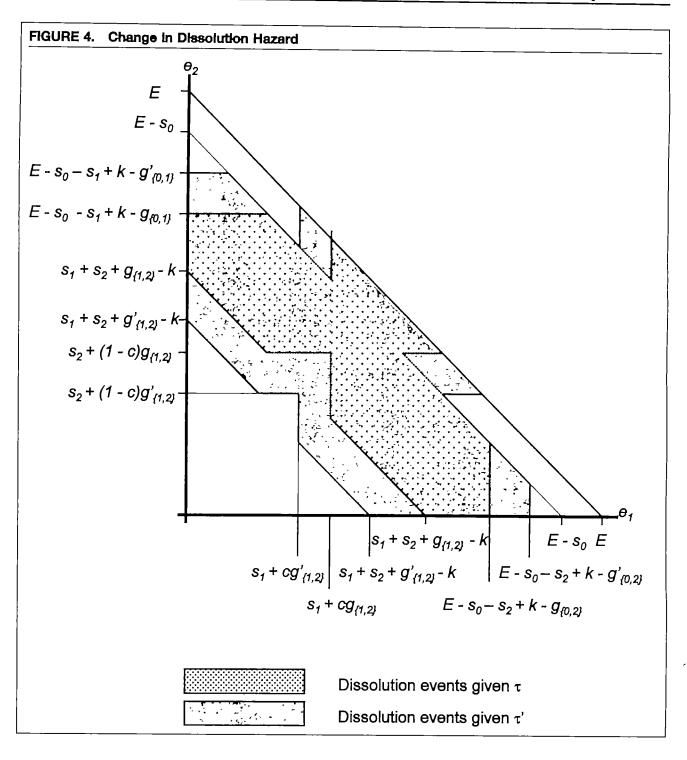

for the two termination types would thus be inconsistent with the Browne, Frendreis, and Gleiber model but would confirm the Lupia and Strøm model, albeit in a rather weak form.

FROM MODELS TO DATA

One advantage of specifying stochastic models of cabinet termination is the close connection between the theoretical output of the models (formal equations describing the shape of the predicted hazard rate for different modes of termination) and the empirical data used in testing (hazard rates calculated from actual

terminations). Even with this close connection, however, some problems remain. One concerns case selection. The data we use to evaluate our theoretical propositions are from King et al. (1990) and Warwick (1992), who include all the postwar cabinets of Austria, Belgium, Canada, Denmark, Finland, France (Fourth Republic), West Germany, Iceland, Ireland, Israel, Italy, the Netherlands, Portugal, Spain, and the United Kingdom. Note, however, that the Lupia and Strøm model does not apply to Norway and Sweden. The Norwegian constitution does not allow for an early chamber dissolution under any circumstances. In Sweden a chamber may be dissolved at any

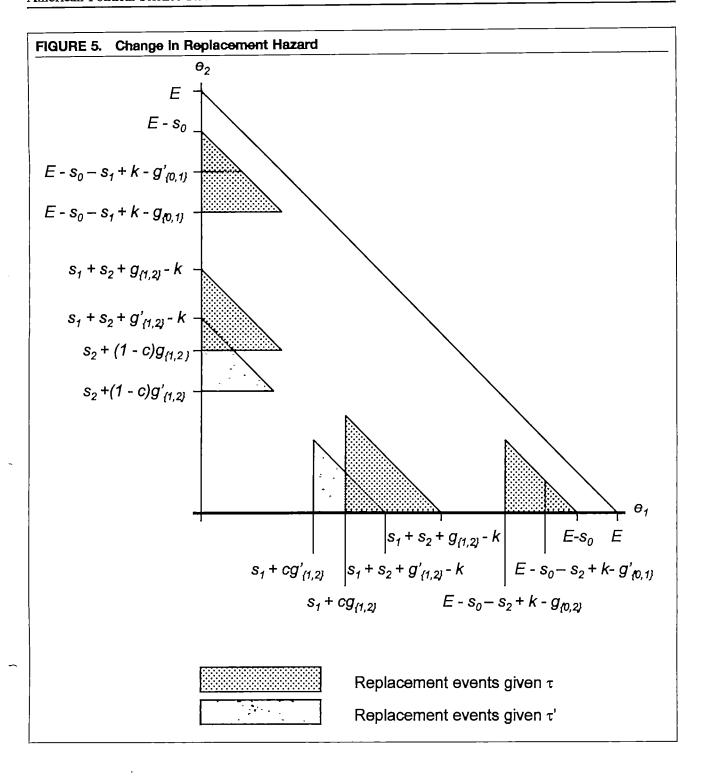

time, but the new parliament may only serve the remainder of the constitutionally mandated interelection period. In our model, this means that in addition to $g_i^{r}(\tau)$, E would change over time as well, which violates a key assumption.

Another problem is a special type of cabinet sometimes included in duration studies. We do not include caretaker cabinets in our data set. These are normally given only very limited powers, work on a limited agenda, and are often formed in anticipation of an upcoming election. More difficult issues are single-party majority cabinets and minority cabinets. Lupia

and Strøm assume that the government is composed of (at least) two parties, which excludes single-party majority cabinets. Consequently, in the empirical analysis we did not include these cases. Whether minority governments should be retained in the data set depends on whether membership in government is defined by which parties are included in the cabinet. Rather than taking a stance on this definitional issue, we performed empirical analyses with and without minority governments.⁷

⁷ If Lupia and Strøm were to identify their share of power index, c,

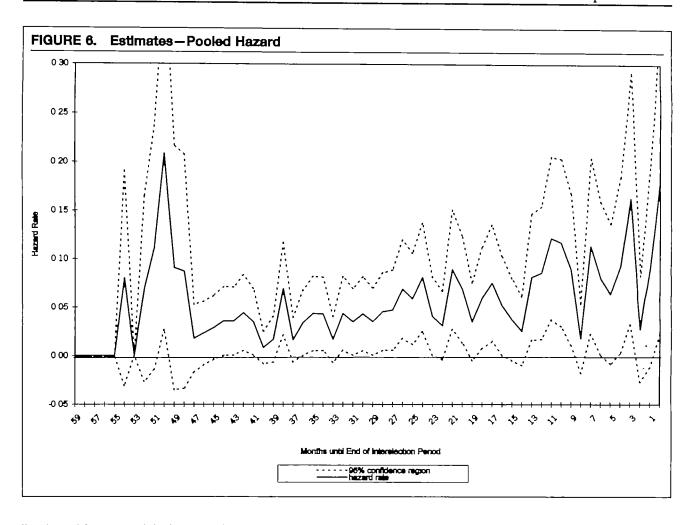

Finally, there is the issue of censoring.⁸ Some cases of censoring are uncontroversial, for example, when a

and/or the value of the cabinet to the parties, g, with the number of portfolios a party holds, then minority cabinets would correspond to the case in which some member of a majority coalition receives a c and/or g equal to zero. In this case, the propositions in the text do not hold, so these types of cabinets ought to be excluded from the empirical analysis. But Lupia and Strøm (1995, 663n) explicitly reject such a restrictive interpretation of c and g. These terms may also include noncabinet posts as well as policy concessions. In this case the propositions would apply to minority cabinets as well.

* Censoring, or more precisely "right censoring," is used when cases

cabinet terminates because the prime minister dies. King et al. (1990) argue, however, that cabinet terminations within 12 months of a mandated election also should be censored because cabinet parties, knowing that they must call an election within a year, may strategically decide to hold early elections if circumstances are advantageous (e.g., high opinion poll ratings). This sort of strategic behavior is exactly what the

fall out of the sample for reasons other than "failure," as defined by the researcher (Kalbflelsch and Prentice 1980).

Lupia and Strøm model tries to explain—not just as the election draws near but over the whole tenure of a cabinet. Censoring these cases would remove exactly the cases most likely to terminate due to dissolution. Therefore, we censor only cabinets that fall for technical reasons (such as the death of a prime minister) and those that actually reach the very end of the CIEP.

ESTIMATION AND RESULTS

The main empirical predictions of our stochastic formulation of the Lupia and Strøm model are given in propositions 1 and 2, which predict that both pooled and dissolution hazards will be strictly monotonically increasing. In contrast, the shape of the hazard for replacements cannot be predicted. Since our results hold for any distribution, we use nonparametric estimation methods.⁹

Figures 6-8 plot our estimate of the hazard function for pooled failures, replacements, and dissolutions, respectively. Each figure also includes 95% confi-

dence bounds (Kalbfleisch and Prentice 1980, 13–4).¹¹ It is important to remember that the time axis in these figures represents months until the end of the CIEP, not cabinet duration in elapsed time.

The first thing to notice about these three figures is that they seem to refute the main prediction of the Browne, Frendreis, and Gleiber model—that hazard rates are constant. Three different nonparametric tests (i.e., the Anderson-Darling, Cramer—von Mises, and Kolmogorov-Smirnov statistics) confirm the statistical significance of this result. Each of these statistics test the null hypothesis that two empirical distribution functions are the same, and each rejects the null hypothesis that the hazard rates in figures 6 and 7 are constant (at p < .05).

A second problem for Browne, Frendreis, and Gleiber's nonstrategic model is that the dissolution and replacement hazards are significantly different. All three of the nonparametric tests reject (p < .01) the null hypothesis that the dissolution and replacement

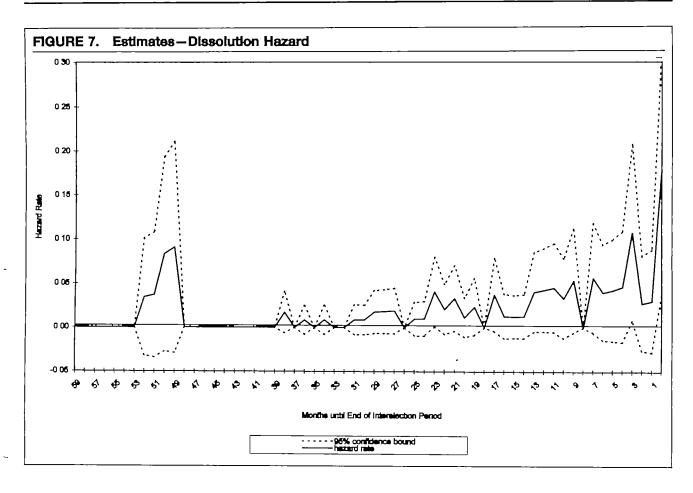

⁹ All our estimates were produced using Gauss. The programs are available, along with data and documentation, upon request.

¹⁰ Our rates are calculated following Meyer (1990) and are a variation on standard Kaplan-Meier estimates, with the time axis modified as discussed in the text. If the number of cabinets at risk of failure in any period is R_n and the number that fail in period t by failure type t are d_n then the hazard rate is simply d_s/R_n . Censoring is accommodated in the estimate of the hazard rate by calculating the

risk set at time t as $R_t = R_{t-1} - d_{t-1} - C_t$, where C_t is the number of cases censored in period t (Kalbfleisch and Prentice 1980).

11 The Kanlan and Meier technique for estimating hazard rates (and

¹¹ The Kaplan and Meier technique for estimating hazard rates (and Meyer's modification, see note 10) is readily generalizable to include different termination types (see Kalbfleisch and Prentice 1980, 168–9). For the case of independent failure risks, one simply calculates the hazard rate for failure type *i* by treating failures of type *j* as censored in the period in which they occurred.

hazard rates are the same. 12 This result is inconsistent with the nonstrategic model but perfectly consistent with a strategic one, since the Lupia and Strøm model is agnostic about the shape of the replacement hazard function. The estimates presented in Figure 8, however, suggest that cabinets face a constant threat of replacement, even as they approach the end of the CIEP.¹³ This is consistent with Alt and King (1994), who found constant hazard rates when they censored cabinet terminations within 12 months of the end of the CIEP.14 In addition to this insight, however, the estimates in Figure 8 show that the hazard rate for bargaining failures remains constant even when the CIEP is drawing near, which Alt and King could not show because of their choice of censoring regime, because they did not distinguish between cabinet replacements and legislative dissolutions, and because

¹² This test excludes the left "hump" (created by cabinets that terminate within a year after the last regularly scheduled election in countries with a 60-month CIEP; see the text discussion below). When it is included, only one of the three tests rejects the null hypothesis.

¹⁵ The three statistical tests referred to above do not let us reject (p < .05) the null hypothesis of a constant hazard rate for replacement over the range of 1-40 months until the end of the CIEP. Furthermore, for the full range, only one of the tests rejects the null of constancy.

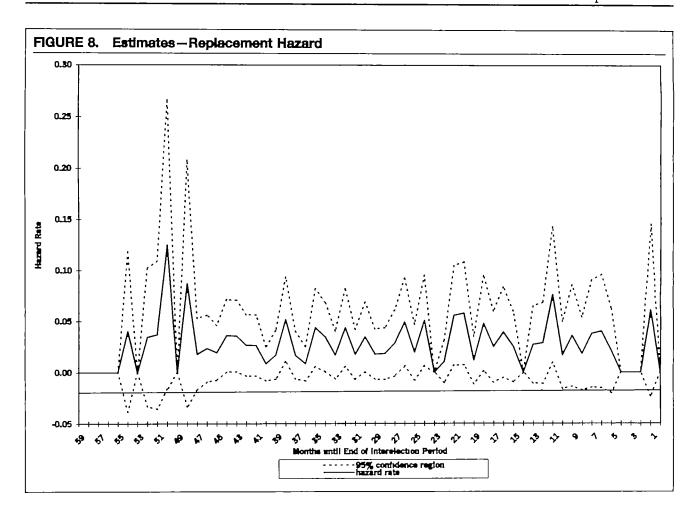

¹⁴ The comparison with Alt and King (1994) is appropriate because the hazard is constant. If the underlying hazard is truly constant, this should be revealed both in traditional hazard rates, calculated with respect to the elapsed age of the cabinet (which is what Alt and King do), and in the type of hazard rates in Figure 8.

they worked in elapsed time instead of time until the end of the CIEP.

For the Lupia and Strøm model, figures 6–8 contain both good and bad news. The good news is that after the initial "hump" (created by cabinets that terminate within 12 months after the last election), rates increase both for pooled and dissolution hazards, which confirms propositions 1 and 2. Moreover, replacement hazards seem to follow a distribution different from that of dissolution hazards, which is consistent with the Lupia and Strøm model. The bad news is that only in the case of pooled hazards is this increase strictly monotonic. Dissolution hazards are flat until about 24 months before the end of the CIEP. Moreover, there is the nonmonotonicity due to the initial hump. That is, the risk of cabinet failure is significantly higher in the first year after an election (in systems with 60-month CIEPs) than in the next several years.

The estimated hazard rates given in figures 6-8 were calculated with data that exclude single-party majority cabinets, caretaker cabinets, and cabinets from Sweden and Norway. The remaining data set is the one to which the theoretical model applies most clearly. A possible problem, however, is the model's ambiguous treatment of minority cabinets, as explained earlier. It is thus worthwhile to examine estimated hazard rates when minority cabinets are excluded from the sample in order to access the degree to which our results rely on this distinction.

Reproducing figures 6 and 8 for minority and ma-

jority cabinets separately does little to change the hazard shapes or our conclusions for the pooled sample and for replacements. For dissolutions, however, the hazard shapes for majority and minority cabinets differ from one another and from the graph in Figure 7. Figures 9 and 10 give the estimates for majority and minority cabinets, respectively. Note that the spike in Figure 7 at about 48 months until the end of the CIEP is due entirely to minority cabinets. What could account for this result? Looking more closely at the specific cases, we find that most are rather unusual in that they are "almost majority" cases. That is, they

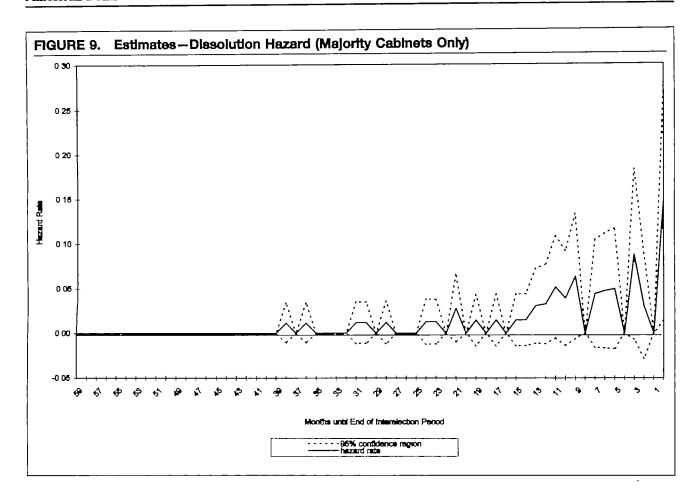

¹⁵ Plots of hazard rates are available from the authors. The claim in the text concerning minority government dissolutions refers to the point estimates. With only 31 cases of minority cabinet dissolutions out of 81 minority governments, strong conclusions about the hazard shape cannot be made.

16 Specifically, they are cabinets for Canada (three cases), Ireland (two cases), and the United Kingdom (one case). In the British case, the election of February 1974 did not produce, for the first time since the 1930s, a single-party majority in the legislature, a situation that quickly changed in October, when Labour won 50.2% of the seats. For Canada, two of the cases are single-party minority Conservative Party cabinets. The first followed the June 1957 election, in which the Conservatives and Liberals polled 42.3% and 39.6% of the vote, respectively. This was the first time since 1925 that one of these two parties did not have a legislative majority. In the next election, held in March 1958, the Conservatives won an astounding 78.5% of the seats. The second Conservative cabinet followed the June 1962 election, in which the two main parties again won substantially fewer seats than the number needed for a majority (43.8% and 37.7%). An

occur in countries in which elections almost always produce single-party majority governments, but sometimes the result is a "hung parliament," e.g., due to a bad electoral draw on polling day. In this case the minority cabinet may choose to go back to the electorate early, anticipating that the bad draw will not be repeated. Of course, in some systems a cabinet cannot dissolve the government and call new elections without a majority vote in parliament, so the support of some opposition parties is needed. When would they get such support? Most likely when there are two large parties that both lost seats to a third smaller party but expect to regain seats if a new election is held immediately (which is a good description of several of the actual cases, as described in note 16).

Figures 9 and 10 also lead us to qualify our early conclusion regarding support for proposition 2. On the one hand, Figure 9, although similar to the right side of Figure 7, does not show even the slight increase in the hazard rate before about 18 months that was apparent in Figure 7. Instead, the hazard is quite flat until, at 18

election in April 1963 gave the Liberals 48.7% and began to establish a new pattern in Canadian politics in which the Liberals, just short of a majority, would rule as a single-party minority cabinet. (It is interesting that one of the other short-lived Canadian cabinets, 17 months, came after an election in 1972 that once again gave the two major parties about 40% of the vote apiece.)

months, it starts to increase quickly.¹⁷ On the other hand, the case of minority governments portrayed in Figure 10 suggests a much longer increase than for majority governments. This conclusion needs to be qualified due to the limited number of cases, but it suggests that, surprisingly, the Lupia and Strøm model is most clearly confirmed in the case of minority governments.

We concluded our empirical analysis with a robustness check. Specifically, we needed to make sure that the introduction of further covariates did not alter the conclusions already drawn. To do this we analyzed the data after stratifying the sample according to various independent variables commonly found in the literature. We then reestimated the pooled and separate survival curves for each stratum and again used three nonparametric tests to evaluate our main hypotheses for each of the strata. In general, the results confirmed previous findings.¹⁸

CONCLUSION

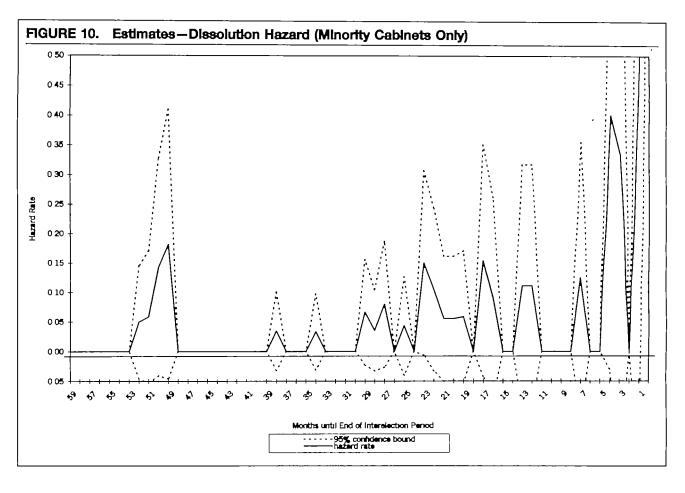

Lupia and Strøm's model of cabinet termination provides a strategic interpretation of critical events

(Browne, Frendreis, and Gleiber 1986), the fundamental theoretical concept in the study of cabinet duration. Whereas Browne, Frendreis, and Gleiber assume that the stochastic process governing the arrival of events determines the distribution of failures directly (i.e., all events are critical), Lupia and Strøm assume that a strategic bargaining process moderates between the arrival of events and the observed distribution of cabinet failures.

We assessed these different theoretical positions by first presenting a stochastic version of the Lupia and Strøm model that allows us to compare its predictions directly to those of Browne, Frendreis, and Gleiber. Furthermore, the stochastic model leads to some new implications about the shape of cabinet termination hazards. We then tested these implications using a sample of postwar cabinets. The results largely reject Browne, Frendreis, and Gleiber's nonstrategic approach but lend only qualified support to the Lupia and Strøm strategic model. We found evidence that the hazard rate for pooled terminations and dissolutions increases as a cabinet approaches the end of the constitutional interelection period, but this function increases monotonically only toward the end of the CIEP. The model works better in the case of minority governments, but it is questionable whether the Lupia and Strøm framework applies to these governments at all. Finally, the Lupia and Strøm model makes no clear prediction about hazard rates due to replacement and

¹⁷ This finding is independent of Alt and King's (1994) finding of flat hazard rates. First, our finding pertains to dissolutions only, a type of termination mostly censored by Alt and King. Second, they analyze hazard rates in clapsed time

 $^{^{18}}$ The programs and data that generated these results are available upon request.

provides no account of cabinet terminations in Norway or Sweden.

On balance, the introduction of a strategic approach seems highly promising, but a model that is explicitly dynamic and incorporates a richer set of institutional variables would be highly desirable. At the very least, it should differentiate between majority and minority cabinets. In general, stochastic bargaining models provide a way to combine strategic models with rigorous empirical analysis. Despite the added complexity of such an effort, our analysis suggests that the alternative—ignoring the bargaining process that intercedes between events and outcomes—would lead to incorrect predictions about the distribution of cabinet failures.

The Dynamics of Collective Deliberation in the 1996 Election: Campaign Effects on Accessibility, Certainty, and Accuracy

ROBERT HUCKFELDT Indiana University JOHN SPRAGUE Washington University in St. Louis JEFFREY LEVINE KRC Research

residential election campaign. In order for communication to be effective, messages conveyed through social interaction must be unambiguous, and the recipient must readily, confidently, and accurately perceive the intent of the sender. We address a number of factors that may influence communication effectiveness: the accessibility and extremity of political preferences, the distribution of preferences in the surrounding environment, disagreement between the senders and receivers of political messages, and the dynamic of the election campaign. The analysis is based on a study of the 1996 campaign, which interviewed citizens and discussion partners between March 1996 and January 1997. The citizens are a random sample of registered voters in the Indianapolis and St. Louis areas, and these registered voters identified the discussion partners as people with whom they discuss either "government, elections, and politics" or "important matters."

his article examines the dynamics of social communication among citizens during a presidential election. We are particularly interested in the campaign as an institution that stimulates effective communication among citizens, as well as the characteristics of individuals that lead to effectiveness in both the transmission and receipt of political messages (Berelson, Lazarsfeld, and McPhee 1954). During a campaign, the citizenry is engaged simultaneously as both senders and receivers of political information, and a primary issue is what factors contribute to clarity in both the transmission and receipt of messages. In other words, in the collective deliberations of democratic politics, who are the good listeners, and who are the good talkers?

The analysis focuses on the factors that enhance and impede effective and unambiguous political communication among citizens. What is the influence of the strength and extremity of political preferences held by the senders and receivers of political messages? Is the effectiveness of political communication compromised by disagreement between the senders and receivers? Does it depend on the distribution of preferences in the receiver's surrounding environment? Finally, does the effectiveness of political communication respond to the changing political-temporal context of a presidential campaign? We draw upon a study of political communication during the 1996 election, and we begin with a review of the conditions that may influence communication effectiveness.

Robert Huckfeldt is Professor of Political Science, Indiana University, Bloomington, IN 47408. John Sprague is Professor of Political Science, Washington University, St. Louis, MO 63130. Jeffrey Levine is Managing Director, KRC Research, 640 5th Avenue, New York, NY 10019.

Support was received through a grant to Indiana University from the Political Science Program of the National Science Foundation. Data for this 1996 election study are available from the Inter-University Consortium for Political and Social Research (Study #2962).

CLARITY, AMBIGUITY, AND DISTORTION IN POLITICAL COMMUNICATION

What factors contribute to clarity, ambiguity, and distortion in socially communicated political information? First, the strength of individual preferences may influence the effectiveness of communication. People with strong attitudes should send clearer messages than those with weak attitudes (Latane 1981; also see Fazio 1990), and strong opinions held by recipients may impede effective communication due to conflict avoidance and selective perception (Festinger 1957; MacKuen 1990).

Second, the more frequently one person is exposed to the preferences of another, the more likely it is that distortion will be reduced and clarity enhanced (Latane 1981, 334). Some people are regular companions, and others are frequent and trusted sources of political information (Downs 1957; Finifter 1974). Moreover, and perhaps more important, a year-long election campaign creates an accumulation of frequent opportunities for political exchange.

Third, people may be less likely to recognize political preferences other than their own. Huckfeldt and Sprague (1995) and Huckfeldt et al. (1998a) demonstrate that judgments regarding the preferences of particular associates are biased by one's own viewpoint, that is, people tend to infer that associates hold opinions similar to their own. Thus, political messages are less likely to be perceived accurately when there is disagreement between senders and receivers.

Fourth, to the extent that people form political expectations based on patterns of social interaction, distortion is more likely when the sender's preference is less common within the receiver's total social network. Individuals generalize on the basis of the environment they know best, the environment they experi-

¹ We see a dyadic process similar to the "false consensus effect," whereby people project their beliefs onto their perceptions of aggregate behavior (Fabrigar and Krosnick 1995; Granberg 1987).

ence through their own patterns of social interaction (Huckfeldt and Sprague 1995). If Joe thinks that most of the people he knows are Clinton supporters, then he is likely to miss the fact that one of them actually supports Dole.

Fifth, the campaign itself may influence the effectiveness of political communication. Exactly how this occurs is problematic, due to campaign effects that may run in opposite directions, but the campaign may clarify political choices, encourage individuals to develop opinions on the candidates, and focus patterns of collective deliberation. Thus, to the extent that the development of more strongly held opinions encourages the more effective communication of preferences, campaigns should stimulate effective communication. Yet, people with strongly held opinions may be less likely to recognize the opinions expressed by others, either because they selectively perceive the message or because their strong opinions discourage the expression of disagreement by others. Thus, to the extent that strongly held opinions obscure or inhibit free and effective communication, campaigns may diminish communication effectiveness by encouraging people to develop the strong views that limit the free flow of political discourse.

DATA AND RESEARCH DESIGN

We address these issues with interview data from a 1996 election study conducted by the Center for Survey Research at Indiana University between early March 1996 and early January 1997. The sample of main respondents (N = 2,174) was drawn from lists of registered voters, and a one-stage snowball sample of discussants (N = 1,475) was obtained from these main respondents. Main respondent samples are drawn from the voter registration lists of two study sites: (1) the Indianapolis metropolitan area, defined as Marion County, Indiana; and (2) the St. Louis metropolitan area, defined as the City of St. Louis and the surrounding (mostly suburban) St. Louis County, Missouri. The data set for this analysis is based on the 1,475 dyads formed between an interviewed main respondent and an interviewed discussant, but we include only dyads for main respondents who name two or more discussants. (Response rates and other details are given in Appendix A.)

Main respondents were asked to provide the first name of not more than five discussion partners. As Appendix B documents, a random half of the sample was asked to name people with whom they discuss "important matters"; the other half was asked to name people with whom they discuss "government, elections, and politics" (Burt 1986; Huckfeldt and Sprague 1995; Huckfeldt et al. 1998a). The experimental condition embedded within the study design allows us to examine the extent to which political information networks are separate from social communication networks more broadly considered. By treating the question wording as a randomly applied experimental stimulus, we are able to address whether the "political" discussants are different from the "important matters" discussants and

whether these differences have consequences for the effectiveness of political communication.

Interviewers then asked a battery of questions about each discussant in the sequential order in which the discussants were named. Next, respondents were asked to identify the presidential candidate supported by each discussant, but the order in which this question was asked about each particular discussant was varied across main respondents. Immediately after asking the question about each particular discussant, the interviewer used a key stroke to start a computer clock. As soon as the respondent answered, the interviewer used a second key stroke to stop the clock before recording the answer. The Computer-Assisted Telephone Interview (CATI) system then asked the interviewer whether the timing was successful,2 and the interviewer asked the respondent a follow-up question: "How difficult or easy was it to say how [discussant's first name] voted?" At the end of the session, main respondents were asked for identifying information to use in contacting and interviewing their discussants. The analyses in this article draw on information taken from both the main respondents and their discussants, such that each observation in the data set reflects a dyadic relationship between a main respondent and a discussant.3

ASSESSING COMMUNICATION EFFECTIVENESS

If campaigns stimulate effective communication, then citizens should become increasingly aware of their associates' preferences over the course of the campaign. They should more readily make judgments regarding the preferences of others; they should become more confident in their own ability to make these judgments; and the accuracy of their judgments should increase. Of course, even effectively communicated messages may be received unsympathetically, so effective communication is no guarantee of influence. The hallmark of effectiveness is the extent to which the message receivers are able to render accessible, confident, and accurate judgments regarding the politics of the senders. Although all individuals are both senders and receivers in the collective deliberations of democracy, we will refer to the main respondent as the "listener" or "receiver" and the discussant as the "talker" or "sender." This terminology focuses attention on the message sent by discussants and received by

² Interviewers generally reported unsuccessful timings based on their own errors, typically in situations when they stopped the timer too quickly. We encouraged interviewers to report such errors, and they were assured that these errors would not affect their performance evaluations. The median response times for the five discussants were, for the first, 1.73 seconds (n = 462); the second, 1.27 seconds (n = 325); the third, 1.18 seconds (n = 250), the fourth, 1.04 seconds (n = 104); and the fifth, 1.43 seconds (n = 83).

Some main respondents (n = 872) appear in more than one dyad, 469 appear in one dyad, 250 in two, 112 in three, 35 in four, and 6 in five. We employ a standard error correction for clustering that takes account of this fact. The correction produces only minor changes (see Rogers 1993), an unsurprising result given the very modest degree of clustering. All results were obtained with Stata, Release 6.

main respondents, which is the only context we are equipped to address with our research. We first discuss accessibility, then confidence and accuracy.

Accessibility and the Ease of Judgment

When the interviewer asked a respondent how she expected one of her discussants to vote in November, she was being asked to connect that person with a particular political preference. Often this is an easy task; many individuals are quite vocal about their strongly held preferences, and their politically attentive associates can predict their behavior quite readily. The task may be more difficult if the discussant is less forceful and decisive in political discussion, has no preference, and so on. In the first instance we might say that the respondent possesses a strong association in memory between the discussant and a particular voting behavior, and this strong association yields a highly accessible perception of discussant preferences. In the latter case, we might say that the association in memory is weak, which yields a much less accessible perception.

In summary, accessibility is defined as the strength of association between two objects in memory. The least accessible perceptions are those that must be constructed on the spot, when there is no association between the objects in memory. When political communication between two people is effective, the cognitive association made between one partner and a particular political preference should be strong in the memory of the other partner, and the cognitive accessibility of that judgment would be enhanced (Fazio 1995).

How do we know whether judgments are accessible? Pioneering work (Bassili 1993; Fazio 1995) has shown that accessibility is revealed by the time required for a response to a question or stimulus. Thus, we measured the time it took respondents to provide a judgment regarding a discussant.

Two issues related to the use of response time (also known as response latency) measures need to be addressed: the baseline speed of response and the problem of learning curves (Fazio 1990). First, some people answer questions more rapidly than others, so it is important to take this into account. We do this by establishing an individually idiosyncratic baseline speed of response to be employed as a statistical control when assessing various effects on the speed with which respondents report judgments about discussants' political preferences. Our measure is based on the mean time that is required for respondents to report their judgments regarding the political preferences of discussants in their residual networks. This residual network is defined as all the respondent's discussants, except for the discussant involved in the particular dyad being analyzed. Thus, the size of the residual network is one less than the total number of discussants identified by a respondent, and not all the discussants in the residual network were interviewed.4

Second, as people progress through a battery of questions, their speed of response accelerates due to a learning curve. This is a potential problem for our research because the order in which discussants are named may be substantively meaningful (Burt 1986; Huckfeldt et al. 1998b). We anticipated this problem by altering the order in which we asked questions about discussant vote preferences. The battery always began with a question about the first discussant's preference. When the respondent named two people, we asked about the first and then the second. When three were named, we asked about the first, third, and second. When four were named, we asked about the first, fourth, third, and second. When five were named, we asked about the first, fifth, second, fourth, and third. Although this produces a perfect correlation between the first discussant named and the first discussant about whose preference the respondent is asked, the correlation drops to -.14 for the remaining discussants, so the learning curve is largely independent of factors related to the order of identification (spouse, close friend, colleague, and so on).

Baseline Speed of Response and Related Control Variables. In the first model of Table 1, we consider a range of factors that may affect the accessibility of the main respondent's judgment about a discussant's candidate preference.5 In the first set of variables, related to the baseline speed of response, are Mean Response Time in the Residual Network and the Question Order for the Perceptions of Discussants, as well as a dummy control variable, First Named Discussant. A faster mean response time in the residual network is associated with a more rapid response time for each of the individual judgments about discussant preferences, and therefore it needs to be controlled. Moreover, the measure for question order produces a substantial effect in terms of shorter response times for judgments regarding discussant preference questions asked later in the sequence. Finally, the dummy variable does not have a statistically discernible effect, that is, response times do not differ between first-named discussants and others once we control for question sequence and mean network response time.

Nature of Relationship. In the second set of factors are variables that concern the relationship between the main respondent and the discussant. Three dummy variables summarize the closeness of that relationship: Spouse, Another Relative, or Close Friend. (The excluded baseline category is a nonrelative who is not a close friend.) As the results show, these variables produce effects in the expected direction, but the standard errors for the coefficients are relatively large, which suggests statistically indiscernible effects.

⁴ Respondents who identified only one discussant were excluded from the analysis. For those who named only two discussants, the

baseline speed is based on a single response time. Response time data are typically akewed, with an extended tail of slow response times. Thus, in constructing a measure for the baseline speed of response, we first take the log for each time and then compute the mean of these logs.

⁵ Accessibility is measured as response time to the question, in hundredths of seconds.

Constant	Accessibility of Main Respondent's Judgment (OLS model)		Confidence of Maln Respondent's Judgment (OLS model)		3. Accuracy of Main Respondent's Judgment (logit model)

Agreement Effects. The third set of factors is related to disagreement among the discussant, the main respondent, and the remainder of the respondent's communication network. The dummy variable Agreement in the Discussion Dyad is based on the self-reports of main respondents and discussants. Table 1 shows that agreement has no effect on the accessibility of the judgment as measured by response time. Similarly, the accessibility of the judgment does not depend on the respondent's perception regarding Proportion of the Residual Network that Agrees with the Discussant. We are interested in whether the respondent's ability to recognize a particular discussant's reported preference depends on the respondent's perception of the extent to which that preference prevails within the remainder of the network. There is no evidence here to suggest such an effect.6

Preference Effects. The fourth and fifth sets of variables cover factors related to the strength of political preferences held by main respondents and discussants. We regard extremity and accessibility as two separate elements of partisan strength (Krosnick and Petty 1995; Weisberg 1980),7 and we consider partisan extremity, the candidate evaluation extremity, and partisan accessibility for both sides of each dyad. For these purposes, Partisan Extremity refers to the distance from the midpoint on the party identification scale. Partisan Accessibility is the speed with which individuals specify their partisanship, measured as the response time for the initial response to the party identification question in hundredths of seconds.8 Candidate Evaluation Extremity is the absolute difference between the individual's rating of the two major party candidates on a five-point scale. (See Appendix B.)

How do the accessibility and extremity of partisan preferences, both for main respondents and discussants, affect the accessibility of respondent perceptions about discussant preferences? The results suggest that the characteristics of dyad members are differentially important. For respondents, only the accessibility of their party identification is associated with the accessibility of their judgment about discussants' vote preference. Respondents with accessible partisan orientations have more accessible perceptions of discussant preferences, even after we control for the baseline speed of response. In contrast, for discussants, only partisan extremity has a discernible effect: Vote pref-

erences of discussants who are extremely partisan are more readily perceived by the main respondents.

This pattern of effects is quite interesting and entirely plausible. Extreme partisans are likely to send unambiguous political messages, so their views are readily perceived. Also, people who hold highly accessible partisan loyalties are more readily able to perceive political preferences in others. Most important, there is no evidence here to support the argument that strong attitudes inhibit political communication, regardless of whether such attitudes are held by receivers or senders, and regardless of whether attitude strength is measured in terms of extremity or accessibility. In other words, we see no reason to believe that strong attitudes lead individuals to disguise, misinterpret, or misperceive political disagreement.

Other Political Characteristics. The sixth set of explanatory factors introduces several other political characteristics of the discussant into the analysis. Two variables are based on the perceptions of the main respondent: Reported Discussion Frequency with the Discussant and Imputed Discussant Knowledge. No effect is found for the latter, but as expected, more frequent discussion reduces the response time. Political Network is a dummy variable to indicate the category of discussant (political or "important matters"), but it has no discernible effect on the accessibility of discussant preferences. (For other analyses of the discussant name generator, see Huckfeldt et al. 1998b.)

Campaign Dynamics. Two variables are used to index campaign time: Campaign Week of the interview and a dummy that measures the Primary Season. The latter is defined to continue through June 30, and this variable indexes all respondents interviewed through that date. The campaign week of the interview begins (at 1) with the interviews in early March and ends (at 36) with election week. Respondents interviewed after the election are also given the maximum value. Thus, the week of the interview indexes the accumulation of opportunities for communication within networks.

During the primary season, we asked respondents whether they thought discussants would vote for a Democrat, a Republican, or an independent. Thereafter, we asked whether discussants would support Bill Clinton, Bob Dole, or some other candidate. (See Appendix B.) The coefficient for the primary season dummy variable (-76.975) suggests that asking about specific candidates rather than the more general party nominee increases the time required to answer by about three-fourths of a second. It seems easier to say in the abstract that an associate will vote Republican or Democratic than to say that the associate will vote for a specific candidate.

Apart from the effect that arises due to the specification of candidates at the end of the primary season, the model suggests a fairly strong, clarifying effect as the campaign progresses—measured as the week of interview—even after all the other factors are taken into account. If we ignore the candidate specification effect, response time decreases by 1.2 seconds across the 36 weeks (-3.44×35) , that is, the accessibility of

⁶ For respondents who named only two discussants, the measure is 0 if the respondent perceives that the other discussant in the network holds a preference different from the one reported by the discussant in the dyad; I if the respondent perceives that the other discussant holds the same preference. For respondents who named more than two discussants, the measure identifies the proportion of the residual network that is perceived to hold the preference reported by the discussant in the dyad.

⁷ In this way it is analytically possible to define an accessible independent, someone who quickly self-identifies as independent on the party identification scale, or an inaccessible strong identifier, someone who takes a long time to report strong attachment to one of the parties.

⁸ The median time of response for the party identification question was 1.2 seconds.

judgment increases. Alternatively, if we only consider the period after the end of the primary season—the first week of July and beyond—response time decreases by approximately two-thirds of a second (-3.44×19) .

In summary, one overall consequence of the election campaign is to make these judgments more accessible in memory. Other factors contribute, and none is more important than the extremity of the discussant's (sender's) partisan identification. The model estimates suggest that response time decreases by more than a full second if the discussant is a strong Republican or Democrat rather than an independent (-36.70×3) . The accessibility of the main respondent's partisanship is nearly as important: Response time for the judgment increases by approximately three-fourths of a second across the lower 95% of the range of the main respondent's response time on the party identification measure $(.13 \times 615)$, 10 even after we take account of the baseline speed of response. In short, strong attitudes, measured either in terms of accessibility or extremity, serve only to enhance rather than impede the effectiveness of communication.

Reflective Confidence In Political Judgments

Accessibility is only one important aspect of effective communication. It is entirely possible for an individual to hold a highly accessible opinion about how someone will vote that is not sustained on further reflection. For example, a person may have a strong association in memory between "Jane" and "support for Republican candidates," but on further reflection he may recall that Jane dislikes politicians from Kansas, which shakes his confidence in his judgment about Jane's support for Dole. Alternatively, a person may have a highly inaccessible opinion about Joe's voting behavior, but further reflection based on a variety of factors—a dimly recalled conversation, a generalization based on other people she knows—may lead her to express a great deal of confidence in her judgment.¹¹

After the main respondent provided a judgment about the discussant's voting preference, the interviewer asked the respondent "how difficult or easy it was to say" which candidate the discussant supports.

⁹ If we include the primary season coefficient in the calculation, predicted response time still decreases across the campaign, from week 1 to week 36 or beyond, by approximately 4 seconds. The combined effect in week 1 is $-76.97 - (3.44 \times 1)$; in week 36 it is $-(3.44 \times 36)$

We treat this question as a measure of the Main Respondent's Confidence in the Judgment, ranging from 0 for those who offered no judgment to 4 for those who found the judgment "very easy." (See Appendix B.)

Nature of Relationship. Unlike the first model of Table 1, the second model shows statistically discernible effects due to the relationship between the discussant and the main respondent. In particular, respondents are more confident in their judgments about the political preferences of spouses and other relatives. People may not have more accessible judgments about a spouse or relative, but they are more confident in the judgments they render. (It remains unclear whether such confidence is justified, which is discussed further below.)

Agreement Efects. The second model of Table 1 also shows no effect on judgmental confidence due to agreement or disagreement with the discussant. Neither accessibility nor judgmental confidence is affected by disagreement within the dyad. Confidence is enhanced if the respondent perceives that a higher proportion of the residual network agrees with the self-reported preference of the discussant in the dyad, but the effect is relatively modest.

Preference Efects. In terms of partisan preferences, the results of the second model show that the extremity of candidate evaluations—for both discussants and main respondents—appears to enhance judgmental confidence. That is, people are more likely to trust their judgment if they or their discussants hold an extreme position regarding candidates. Confidence is also enhanced if the discussants report a more extreme position on the partisan identification scale.

Other Political Characteristics. The second model in Table 1 reveals that the confidence of respondents' judgments is unaffected by the imputed knowledge of the discussant. In contrast, effects are produced by whether the discussant is named as part of the political network (as opposed to the more general "important matters" network) and by the reported frequency of political discussion; this latter effect is quite pronounced.

Campaign Dynamics. The effect of campaign week noted in model 1 is sustained in model 2. Across the campaign, respondents become three-quarters of a point more confident in their judgments (.022 × 35), but this is partially offset by the effect of the primary season, when respondents are only asked whether their discussants will support the Democrat, the Republican, or some other candidate. ¹² Although we interpret this as a consequence of question wording, it is worth noting that reality lurks behind the choice of words. During the primary season, it was not feasible to ask about specific candidates, because no one knew with certainty whether Bob Dole would be the Republican

¹⁰ To avoid overstating the effect of partisan accessibility, the range of the response time measure is truncated in calculating the magnitude of this effect by eliminating the top 5% of the distribution. The elongated tail of the original distribution represents uncharacteristically long response times among a very small part of the sample. After truncation, the range of response times is from 17 (or .17 seconds) to 632 (or 6.32 seconds).

¹¹ Bassili (1996) refers to these sorts of evaluations as meta-attitudes, or attitudes regarding attitudes. We anticipate that people will, in general, have more confidence in judgments that are more accessible. Indeed, the correlation between accessibility and confidence is .48. The correlation between accessibility and accuracy is .28, and the correlation between confidence and accuracy is .43.

¹² If we include the primary season coefficient in the calculation, confidence still increases across the entire campaign (from week 1 to week 36 or beyond), but the net effect is reduced to .4.

nominee or whether Ross Perot would run. As noted earlier, respondents might be confident about a response to a relatively abstract question but less so when asked about particular candidates discussants would support.

The Accuracy of Political Judgments

Fundamentally, the effectiveness of political communication depends upon the accuracy of one citizen's judgment regarding the preferences of another (Huckfeldt and Sprague 1995; Huckfeldt et al. 1998a). If Jane thinks that Sam supports Dole but Sam is actually a Clinton voter, the collective deliberations of democracy have malfunctioned. Indeed, accurate perception is a defining ingredient not only of effective communication but also of collective deliberation in democratic politics.

The Accuracy of the Main Respondent's Judgment is defined as agreement between the main respondent's perception of the discussant's preference and the discussant's self-reported preference. A binary response—accurate or inaccurate—is produced, so a nonlinear logit model is employed. Because of the model's nonlinear parameters, the effect of any single variable is best evaluated with respect to a particular point on the probability distribution for accuracy. We generally examine the magnitude of change in the probability of an accurate perception across the range of one variable while other variables are held constant at typical values.
